The asymptotic self-similar form of cylindrically or spherically imploding shock waves is extracted by numerically solving non-self-similar problems. The shock wave is generated by a contracting piston with finite initial velocity. For the initial shock motion, a perturbation method is used to determine the starting condition for the numerical calculation. Propagation of the shock wave and flow field properties are obtained and the transition of the non-self-similar motion of the shock wave into the self-similar one is presented. Good agreement between self-similar exponents determined from the variation of the shock strength and those calculated by Guderley is obtained. (21 refs.)

76070 The impact of compressible liquids. M.B.Lesser (Univ. of Lulea, Lulea, Sweden), J.E.Field.
In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.97-122. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]
The authors' review concentrates on determining the maximum pressure-loading and other possible damage mechanisms that will erode a solid target. This implies that the early stages of the impact process are studied, during which the shock waves signaling a collision are spreading out through both the liquid and solid. Compressible behavior of the liquid and the motion of the solid target have to be taken into account. The problem involves, in general, free surfaces and the constitutive behavior of both liquid and target. The approach has been analytical, numerical, and experimental, with perhaps the largest gains made experimentally. (94 refs.)

76071 Thermophoresis of spherical particles and the dependence of the jump coefficients on the accommodation coefficient. Shen Ching (Inst. of Mech., Acad. Sinica, Peking, China). *Acta Mech. Sin. (China)*, no.1, p.5-15 (1983). In Chinese.
The problem of thermophoretic force exerted on a sphere held in a rarefied gas ($K_n \ll 1$) with a temperature gradient is considered. In the inner region the Boltzmann-Krook-Welander equation is solved under Maxwell-type boundary conditions in the wall, and this solution is matched with the solution of the Stokes and Laplace equations. The slip coefficient C_m , the thermal creep coefficient C_s , and the temperature jump coefficient C_t are determined from the first approximation of the inner solution. The thermophoretic force thus obtained is in good agreement with experimental data, and the values of C_m , C_s , C_t thus calculated and their dependence on the thermal accommodation coefficient a are also in good agreement with the results of solution of the planar problem obtained by using variational and other methods. (14 refs.)

76072 Heterogeneous vibrational relaxation upon free molecular flow of diatomic gas past concave bodies. L.P.Gashtol'd (N.A. Voznesenskii Leningrad Inst. of Finance & Economics, Leningrad, USSR). *J. Eng. Phys. (USA)*, vol.43, no.3, p.1012-16 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.438-43 (Sept. 1982).
The method of successive calculation of multiple reflections is used for investigating heterogeneous vibrational relaxation when a free molecular stream of diatomic gas flows past a concave body. (4 refs.)

76073 Modern methods of numerical investigation of rarefied gas phenomena. F.G.Tcheremissine (Dept. of Aeronautical Engng., Indian Inst. of Sci., Bangalore, India). *Proc. Indian Acad. Sci. Eng. Sci.*, vol.5, pt.2, p.159-67 (July 1982). [received: April 1983]

It is well-known that an adequate description of a dilute gas is given by the Boltzmann equation of the kinetic theory of gases. To meet today's technological needs, different attempts to obtain numerical solutions of this equation have been made. These attempts can be divided into two main groups; stochastic simulation of gas phenomena, and numerical methods to solve the Boltzmann equation itself. The first approach arose from purely intuitive considerations; later some theoretical analysis followed and the relation to the Boltzmann equation became more evident. Thus the direct stochastic simulation of molecular motion received theoretical approval. The second approach did not need any theoretical justification; here the problem of prime importance was that of its practical efficiency. The way to improve the accuracy of this method lay in the application of economical numerical algorithms based on recent advances in computational fluid mechanics and in numerical methods in general. Further sophistication of computers will provide technological support for more accurate investigations of rarefied gas phenomena. (19 refs.)

47.50 NON-NEWTONIAN DYNAMICS

76074 Some constitutive equations for non-Newtonian fluids. C.F.Chan, Man Fong (Dept. of Mech., Peking Univ., Peking, China). *Acta Mech. Sin. (China)*, no.1, p.16-26 (1983). In Chinese.
Non-Newtonian fluids may be classified as (i) inelastic fluids, fluids whose viscosity is not a constant, (ii) fluids with yield stress, (iii) fluids with elastic properties, (iv) thixotropic fluids. Some constitutive equations of the above four types of fluids have been considered. Their usefulness and conditions under which they may be used have also been discussed. Numerical values of some of the parameters occurring in these constitutive equations have been given. (12 refs.)

76075 Viscoelastic squeeze-film flows—Maxwell fluids. N.Phan-Thien, R.I.Tanner (Dept. of Mech. Engng., Univ. of Sydney, Sydney, Australia). *J. Fluid Mech. (GB)*, vol.129, p.265-81 (April 1983).
An exact solution for the squeeze-film motion in an upper convected Maxwell fluid is given for both the plane and axisymmetric cases. Inertia and viscoelastic effects are included, and it is shown that the solution depends only on the product of the Weissenberg and Reynolds numbers. Solutions are generated for values of this product up to 500 without numerical problems. The solutions show wave propagation and show a reduced load capacity relative to the Newtonian case. (20 refs.)

76076 Plane and axis-symmetric stagnation flow of a Maxwellian fluid. N.Phan-Thien (Dept. of Mech. Engng., Univ. of Sydney, Sydney, NSW, Australia). *Rheol. Acta (Germany)*, vol.22, no.2, p.127-30 (March-April 1983).
Exact solutions to the plane and axis-symmetric stagnation flows of a Maxwellian fluid including inertia are reported. It is found that the fluid elasticity decreases the boundary layer thickness. (6 refs.)

76077 On nonlinear effects in the extensional flow of polymeric liquids. A.I.Leonov, A.N.Prokunin (Inst. for Problems in Mech., Acad. of Sci., Moscow, USSR). *Rheol. Acta (Germany)*, vol.22, no.2, p.137-50 (March-April 1983).
The problems of uniform extension of liquids under constant strain rate and constant stretching force have been studied using a nonlinear rheological theory that describes the effects of finite elastic strains in viscoelastic liquids, with provision for the influence of deformative orientation on a scalar relaxation time. It has been shown that the predictions of the theory are in rather good agreement with numerous data for the extensional flow of polyisobutylene, even without taking the deformative orientation into account, (however, in cases where the latter was important it was considered in detail). Some new results for the extensional properties of polyethylene melts, as well as those from the literature, show that its behaviour is qualitatively different from that of polyisobutylene. The mathematical description of the extensional flow of polyethylene has to take into consideration the mechanism of flow thermoactivation and, apparently, an accumulation of ruptures of macromolecules in addition to the deformative orientation phenomenon. (25 refs.)

76078 Injection moulding of thermoplastics: freezing during mould filling. S.M.Richardson (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll. London, London, England). *Rheol. Acta (Germany)*, vol.22, no.2, p.223-36 (March-April 1983).
The injection moulding of thermoplastic polymers involves, during mould filling, flows of hot melts into mould networks, the walls of which are so cold that frozen layers form on them. Theoretical analyses of such flows are presented. (8 refs.)

76079 Numerical methods in non-Newtonian fluid mechanics. M.J.Crochet (Univ. Catholique de Louvain, Louvain-la Neuve, Belgium), K.Walters. In book: *Annual review of fluid mechanics*. Vol.15, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.241-60. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]
The authors introduce a flow classification (Crochet et al. 1983) and consider briefly the numerical methods required in each flow type. They then concentrate on one subject, namely the flow of highly elastic liquids in complex geometries. The reasons for this emphasis are twofold. First, the related flow problems have a different structure from that found in the corresponding Newtonian situation, and second, much of the worthwhile research effort in non-Newtonian fluid mechanics in the last decade has been expended in this direction. 47.55 NONHOMOGENEOUS FLOWS

76080 The transport from a drop in an alternating electric field. S.K.Griffiths (Sandia Nat. Labs., Albuquerque, NM, USA), F.A.Morrison, Jr.

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.717-26 (May 1983).
Analyses of heat and mass transfer from a drop in an electric field have, to date, dealt only with steady electric fields. This study presents both high and low Peclet number solutions for transport in an alternating electric field. The low Peclet number transport is investigated analytically using a composite, double perturbation expansion. Special analytic methods are developed to consider the previously untreated transport problem where the steady and time-dependent components of the fluid motion are of equal magnitude. A digital computer is employed to obtain exact solutions to the recursive governing equations. These solutions yield accurate results for Peclet number in the range 0-30 and thermal vibration number above 200. (23 refs.)

76081 Settling of encapsulated droplets at low Reynolds numbers. E.Rushton, G.A.Davies (Dept. of Chem. Engng., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.337-42 (June 1983).
Deals with some interesting problems associated with translation of liquid droplets which have not previously been considered and which have some importance in defining process conditions in their application. The problems relate to translation and settling of encapsulated droplets in viscous liquids and arise in membrane separation processes which are now the subject of much research and development work, Li (1971), Li and Asher (1973), Martin and Davies (1976). In these processes, the overall objective is to selectively extract compound(s) from a liquid into a second immiscible liquid. This is accomplished by separating the two miscible phases, donor and receptor, by a membrane through which the solids may diffuse. One such process uses a liquid membrane phase so that there are three fluid phases; the membrane phase has to be immiscible with the other two. (10 refs.)

76082 Field-flow fractionation. R.Smith (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

J. Fluid Mech. (GB), vol.129, p.347-64 (April 1983).
If different contaminant species are subject to different transverse drift rates (e.g. gravitational settling), then there is a tendency for the species to separate out. The efficiency of this separation depends upon the relative shapes of the longitudinal concentration distributions. Jayaraj & Subramanian (1978) have drawn attention to the disparity between their computed skew concentration distributions and the symmetric Gaussian distributions predicted by one-dimensional diffusion models. Here it is shown that a one-dimensional delay-diffusion model yields suitably skew predictions. The model equation is used to investigate the extent to which the separation of different contaminant species can be improved by pre-treating the sample (i.e. allowing differential drift) in a stationary fluid before being eluted into the shear flow. Pretreatment is found to be very effective for plane Poiseuille flow but not for the thermogravitational columns. (10 refs.)

Viscous-inviscid interactions in cascades See Entry 75997

47.55C Jets

76083 Velocity distribution in turbulent cross jets. K.Subramanya (Civil Engng. Dept., Indian Inst. of Technol., Kanpur, India), P.D.Porey.

Indian J. Technol., vol.20, no.11, p.427-33 (Nov. 1982). [received: May 1983]
An experimental study of the velocity distribution of a round turbulent jet penetrating into a cross flow fluid with the same properties as the jet is reported. The axial component of the jet velocity vector at various transverse locations of a cross section are found to be distributed according to a similarity law. In two mutually perpendicular transverse directions the similarity profiles are found to have identical functional form. Their length scales also have identical functional form. The maximum axial velocity of the jet is found to decay exponentially with a penetration length parameter. The potential length of the jet is shown to be a function ratio of the cross jet. (10 refs.)

76084 Effect of initial velocity difference between phases on evolution of two-phase jet. A.I.Kartushinskii, V.A.Leonov, A.S.Mul'gi ('Sergo Ordzhonikidze' Moscow Inst. of Aviation, Moscow, USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.960-2 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.371-4 (Sept. 1982).
Results of an experimental study are presented concerning the effect which the initial difference between the velocity of the gas and the velocity of the pollutant particles have on the characteristics of an inundated air jet carrying a pollutant in the form of spherical particles of high-density material. (4 refs.)

76085 The turbulent wall jet—measurements and modeling. B.E.Launder (Dept. of Mech. Engng., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), W.Rodi.

In book: *Annual review of fluid mechanics*. Vol.15, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.429-59. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]
The turbulent wall jet, even limiting attention to the topographically simple cases beloved of academics, arguably provides more puzzles for those seeking an ordered set of rules to describe turbulence than any other class of turbulent shear layer. One can regard a wall jet as a boundary layer in

which, by virtue of the initially supplied momentum, the velocity over some region in the shear layer exceeds that in the free stream. The authors extend a previous review on turbulent wall jets. They consider physical processes in more detail, radial wall jets and examines how well current calculation schemes succeed in mimicking the measured behaviour of wall jets. (69 refs.)

47.55H Stratified flows

76086 Compressibility effects on waves in stratified two-phase flow. G.B.Wallis, B.J.Hutchings (Thayer School of Engng., Dartmouth Coll., Hanover, NH, USA).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.325-36 (June 1983).
Ardron (1980) presented both one-dimensional and two-dimensional analyses of wave propagation in horizontal stratified two-phase flow. He compared the two approaches and concluded that the comparison helped to improve confidence in the use of one-dimensional approximations for the analysis of complex systems such as nuclear reactors. There are several assumptions in Ardron's developments. When alternative assumptions are made the results change. By examining the consequences of several possible assumptions the authors have learned from this example that considerable care may be necessary in the reduction of a mini-dimensional two-phase flow problem to a simpler form. The authors present a more complete two-dimensional solution of this problem and discusses the limitations of the approximate solutions. (2 refs.)

76087 An experimental study of entraining, stress-driven, stratified flow in an annulus. D.R.Scranton, W.R.Lindberg (Dept. of Mech. Engng., Univ. of Wyoming, Laramie, WY, USA).

Phys. Fluids (USA), vol.26, no.5, p.1198-205 (May 1983).
An experimental study of turbulent, two-layer stratified entrainment in an annular, surface stress driven geometry is described. Density and velocity probes were used to determine interfacial locations and flow patterns. Annular geometry effects were examined using three channel widths. The entire flow system was constructed of clear plastic to facilitate observations. The measurements and observations of these flows over a wide range of Richardson number indicate a strong secondary circulation, radial interfacial tilt, and a dominant dependence of flow parameters on the annular radius. It is concluded that the entrainment results in annuli such as the one used in this study may not be directly applicable to one-dimensional entrainment processes. (15 refs.)

76088 Application of the method of streams to one problem of the dynamics of a viscous stratified fluid. A.V.Babakov.

Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.2, p.432-9 (March-April 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*

A difference scheme based on the method of streams is proposed for the numerical investigation of problems of the dynamics of a viscous incompressible stratified fluid. The results are presented of a systematic study of the problem of collapse of a uniform 'spot' situated in a fluid with stable stratifications obtained on the basis of this difference scheme. The results are compared with existing numerical and experimental data, and a conclusion is made regarding the parameters of a calculating grid necessary for numerical investigation of the problem. (10 refs.) A.J.B.

47.55K Multiphase flows

76089 Two-phase flow patterns: a review of research results. S.Z.Rouhani, M.S.Sohal (EG&G Idaho Inc., Idaho Falls, ID, USA).

Prog. Nucl. Energy (GB), vol.11, no.3, p.219-59 (1983).
Presents a literature review covering various aspects of two-phase flow patterns. After a description of commonly observed flow regimes in horizontal and vertical pipes, some different types of flow pattern maps are discussed. Experimental techniques for direct and indirect determination of flow regimes are reviewed. These include direct viewing, photography, X-ray and statistical analysis of fluctuations in measured pressure or void fraction which yield power spectral density and probability density functions. The recent advances in the use of neutron noise analysis are also discussed. Flow regime transition criteria based on correlations and theoretical derivations are covered next. Finally, the effects of wall roughness, heat flux and flow acceleration on flow regime transitions are discussed. Throughout the paper an attempt has been made to identify the areas where new development work is needed. (69 refs.)

76090 Unsteady flow of a dusty viscous liquid through confocal elliptical ducts. M.Gupta, H.S.Sharma (Dept. of Maths., Agra Coll., Agra, India).

Indian J. Theor. Phys., vol.29, no.3, p.227-37 (Sept. 1981).
The unsteady flow of a dusty viscous liquid through long confocal elliptical ducts when the axial pressure gradient is an arbitrary function of time have been investigated by repeated use of the finite Mathieu transform and the Laplace transform. The cases when this pressure gradient is impulsive, exponential, and periodic have been discussed as particular examples. The results for unsteady flow of a dusty viscous liquid when the confocal elliptic cylinders transit to co-axial circular cylinders have been deduced. (13 refs.)

76091 Simplified nonlinear descriptions of two-phase flow instabilities in vertical boiling channel. H.Gurgenci, T.N.Veziroglu, S.Kakac (Dept. of Mech. Engng., Univ. of Miami, Coral Gables, FL, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.671-9 (May 1983).
A constant-property homogeneous-flow model is developed to generate the limit cycles of pressure-drop and density-wave oscillations in a single-channel upflow boiling system operating between constant pressures, with upstream compressibility introduced through a surge tank. In the model, thermodynamic equilibrium conditions are assumed and the effects of the wall heat storage and the variation of the fluid properties are neglected. Satisfactory agreement with the experimental cycles is noted for the pressure-drop oscillations. As for the density-wave oscillations, the agreement with the experiments is reasonably good regarding the periods of the oscillations, but not so good for the amplitudes. (8 refs.)

76092 Gas particulate flow through a tube of varying cross-section. S.Prabha, R.K.Jain (Dept. of Math., Indian Inst. of Technol., Kanpur, India).

Indian J. Pure & Appl. Math., vol.14, no.3, p.377-94 (March 1983).
Gas-particulate flow with incompressible gas phase and compressible particle phase is considered through a tube of varying cross-section. Series solution for small Reynolds number is developed in terms of the small parameter ϵ which

gives the rate of variation of the cross-section of the tube with the axial distance. Expressions for the stream functions and velocity components for gas and particle phases, pressure distribution and shear stress at the tube wall are obtained correct up to the order of ϵ^2 . It is shown that the particulate density increases in the radial direction and becomes large at the tube wall. It is further indicated that the shear stress at the tube wall for gas-particulate flow is less as compared to the shear stress for the gas-phase only. (13 refs.)

76093 On the slow translation of a solid submerged in a fluid with a surfactant surface film. II. R.Shail, D.K.Gooden (Dept. of Maths., Univ. of Surrey, Guildford, England).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.227-50 (June 1983).
For pt.1 see *ibid.*, vol.8, p.627-639 (1982). In Shail and Gooden (1982) the problem of a solid particle translating in a semi-infinite fluid, whose surface is contaminated with a surfactant film, was examined in the quasi-steady Stokes flow regime. Various linearised models governing the variation of film concentration were considered, but the analysis was approximate in that the fluid motion generated was represented by that due to Stokeslet situated at the center of the particle. In this paper the authors remove the latter restriction and treat two specific solids, namely a rigid flat circular disk and a sphere, which move axisymmetrically perpendicular to the fluid surface. This surface is assumed to remain plane throughout the motion. The velocity field in the translating-disk problem is represented in terms of harmonic functions, and the resulting mixed boundary-value problems are reduced, for each of the film behaviours examined, to the solution of sets of simultaneous Fredholm integral equations of the second kind. These equations are solved both iteratively and numerically, and the drag on the disk is computed. For the sphere a stream-function formulation in bispherical coordinates is used. Application of the boundary conditions at the sphere and film results in infinite sets of simultaneous linear equations for the coefficients in the eigenfunction expansion of the stream function. These equations are solved by the method of truncation, and the drag on the sphere is determined. (14 refs.)

76094 Two-phase flow in a vertical pipe and the phenomenon of choking: homogeneous diffusion model. I. Homogeneous flow models. Z.Bilicki, J.Kestin (Brown Univ., Providence, RI, USA).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.269-88 (June 1983).
Examines the topological structure of all possible solutions which can exist in flows through adiabatic constant-area ducts for which the homogeneous diffusion model has been assumed. The conservation equations are one-dimensional with the single space variable z , but gravity effects are included. The conservation equations are coupled with three equations of state: a pure substance, a perfect gas with constant specific heats, and a homogeneous two-phase system in thermodynamic equilibrium. The preferred state variables are pressure P , enthalpy h , and mass flux G^2 . The topological characteristics of the solutions allow one to study all flow patterns which can, and which cannot, occur in a pipe of given length L into which fluid is discharged through a rounded entrance from a stagnation reservoir and whose back-pressure is slowly lowered. The set of flow patterns is analogous to that which occurs with a perfect gas, except that the characteristic numerical values are different. They must be obtained by numerical integration and the influence of gravity must be allowed for. The preceding conclusions are valid for all assumptions concerning the shearing stress at the wall which make it dependent on the state parameters only, but not on their derivatives with respect to z . However, the study is limited to upward flows for which the shearing stress at the wall and the gravitational acceleration are codirectional. (17 refs.)

76095 Particle fraction and velocity measurement in gas-powder streams by capacitance transducers. G.A.Irons, J.S.Chang (McMaster Univ., Hamilton, Ontario, Canada).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.289-97 (June 1983).
A simple, economical and accurate technique, based on the different dielectric constants of solids and gases, has been developed to determine instantaneous, in-situ void fractions and particle velocities in gas-powder streams. Two different electrode configurations, were investigated for sensitivity and flow-regime dependency. Stationary, as well as high speed cinematographic, calibrations were performed. The technique is suitable for process control. (12 refs.)

76096 Numerical solution of equations of the dynamics of a viscous incompressible fluid containing dispersed particles. A.L.Dorfman.

Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.2, p.423-31 (March-April 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*

The author presents a numerical finite-difference algorithm, based on the method of decomposition, for solving equations of the movement of heterogeneous mixtures, represented with the aid of an ensemble of mutually-penetrating and mutually-interacting continuous media occupying one and the same volume. (8 refs.) A.J.B.

76097 Mathematical modeling of two-phase flow. D.A.Drew (Dept. of Math. Sci., Rensselaer Polytech. Inst., Troy, NY, USA).

In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.261-91. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]

Examines the common features of dispersed two-phase flows from a continuum-mechanical approach. Since it is not universally accepted that such an approach is valid, the author discusses some philosophical reasons for taking such an approach. The approach is based on the view that it is sufficient to describe each material as a continuum, occupying the same region in space. This new 'material' consists of two interacting materials (called phases, even though they often are not different phases of the same material). The author reviews the connection with the exact, or microscopic description, through the application of an averaging process to the continuum mechanical equations describing the exact motion of each material at each point. (71 refs.)

76098 Complex freezing-melting interfaces in fluid flow. M.Epstein (West Coast Office, Fauske & Associates Inc., Encino, CA, USA), F.B.Cheung.

In book: *Annual review of fluid mechanics. Vol.15*, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.293-319. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1]

The authors present an overall view of the subject of solid-liquid phase change in fluid flow with major emphasis on situations in which there are strong interactions among the flow and the motion as well as the shape of the solid-liquid interface. They discuss the problems and phenomena of solid-liquid phase change in a flowing melt in three main groups. These are (a) phase change in external forced flow, (b) phase change in internal forced flow and (c) phase change in natural convection flow. (82 refs.)

47.55M Flow through porous media

76099 Axisymmetrical two-dimensional steady and unsteady flow through porous media. Liu Ciqun (Lanchou Res. Div. of Mech. of Flow Through Porous Media, Acad. Sinica, Lanchou, China).

Acta Mech. Sin. (China), no.2, p.103-10 (1983). In Chinese.
The author studies the axisymmetrical two-dimensional steady and unsteady flow of homogeneous liquids in carbonate reservoirs. A formula for limiting producing rate is given for a balanced state of injection and production that can be used to estimate maximum output. Line source solutions are sought for the unsteady flow of a slightly compressible liquid doubleporous media that can be used to analyse data for partially penetrating well testing. (11 refs.)

76100 Regular flow around a flat plate set between two parallel walls with different permeabilities. P.Capodanno (Acad. Polonaise des Sci., Warsaw, Poland).

Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland), vol.30, no.1-2, p.115-20 (1982).

It is shown that if the permeabilities and the plenum-chamber pressures satisfy suitable conditions, there is one regular flow, with finite velocity at the sharp trailing edge, around a flat plate set between two parallel walls with different permeabilities. (4 refs.)

76101 Unsteady flow of a viscous fluid in a porous elliptic tube. P.C.Gupta, R.G.Sharma (Dept. of Maths., Agra Coll., Agra, India).

Indian J. Theor. Phys., vol.29, no.3, p.271-9 (Sept. 1981).

Unsteady laminar flow of a viscous incompressible fluid through porous media in a long uniform elliptic tube with impermeable boundary has been studied by using Mathieu functions and the technique of Laplace transforms. The axial pressure gradient has been taken as any function of time. A few particular cases, i.e. flow under constant pressure gradient and harmonically oscillating pressure gradient have been discussed. Flow of ordinary viscous fluid with no resistancy of media has been deduced. It is observed that if one puts $\rho(\tau)=0$, the result coincides with that obtained by Narasimhacharyulu and Pattabhiramacharyulu (1978). (5 refs.)

76102 Residence time distribution in annular packed and fluidized beds. K.Kasthuri, G.S.Laddha (AC Coll. of Technol., Madras, India).

Indian J. Technol., vol.20, no.11, p.438-40 (Nov. 1982). [received: May 1983]

Residence time distribution studies are presented for flow through annular packed and fluidized beds. A generalized correlation for predicting the axial dispersion coefficient, applicable for both fixed and expanded beds is proposed. (6 refs.)

76103 Gas jets in fluidized beds: the influence of particle size, shape and density of gas and solids entrainment. M.Filla, L.Massimilla, S.Vaccaro (Istituto di Chimica Industriale e Impianti Chimici, Univ. di Napoli, Napoli, Italy).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.259-67 (June 1983).

Gas has been injected in two-dimensional fluidized beds of solids different in size, density and shape. The ranges of solids sizes and bed heights were such as to produce relatively steady permanent jets. The mechanics of dispersion of these jets has been studied measuring jet angles, jet gas and solids velocity profiles, and particle entrainment velocities. The proportions of total mass and momentum flowrates pertaining to gas and solids have been calculated from these data. (16 refs.)

76104 Statistical study of fluctuation of gas flow rate in caps in fluidized-bed processing units. A.P.Baskakov, V.G.Tuponogov, N.F.Filippovskii (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.949-51 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.357-60 (Sept. 1982).

Results are presented from correlational and spectral analysis of gas flow rate fluctuations in caps in fluidized-bed processing units with bed depths up to 0.8 m. (5 refs.)

76105 Heat transfer in a fluidized bed with allowance for the filtration component. N.V.Antonishin, M.A.Geller, V.I.Ivanyutenko (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR).

J. Eng. Phys. (USA), vol.43, no.3, p.952-5 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.360-4 (Sept. 1982).

A two-phase model of surface-to-pseudoturbulent dispersed bed heat transfer is applied for calculating temperature fields in a fluidized bed. Calculation results are compared with experimental data. (6 refs.)

76106 Convective instabilities in binary mixtures in a porous medium. H.Brand (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA), V.Steinberg.

Physica A (Netherlands), vol.119A, no.1-2, p.327-38 (April 1983).

The authors investigate the instabilities which can occur when a layer of a mixture of two miscible fluids in a porous medium is heated from below or from above. They find that either a stationary instability or an oscillatory instability can occur as the first bifurcation depending on the sign and the magnitude of the Soret coefficient. The possibility of an oscillatory convective instability when heating is done from above is pointed out for the first time. They discuss the mechanism of these instabilities using energy balance considerations. (27 refs.)

76107 Unsteady natural convection in a porous layer. D.Poulidakos, A.Bejan (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA).

Phys. Fluids (USA), vol.26, no.5, p.1183-91 (May 1983).

The focus of this paper is on the functionals of the transient mechanism responsible for the establishment of natural convection in a two-dimensional porous layer confined between isothermal vertical walls and insulated horizontal walls. In the first part of the paper, pure scaling arguments are used to identify the characteristic time scales of the phenomenon and, based on these scales, the evolution of the porous system to steady state. The type of steady state is shown to depend on the relative order of magnitude of the characteristic time scales. Distinct vertical boundary layers are shown to be possible if $(L/H)Ra^{1/2} > 1$, and distinct horizontal layers if $(H/L)^{1/2}Ra^{1/4} > 1$. In the second part of the paper, these and other scaling laws of the transient evolution to steady state are successfully tested against a series of transient numerical experiments conducted in the range $H/L=0.2-5$ and $Ra=10-50$. 47.60 FLOWS IN DUCTS, CHANNELS, AND CONDUITS

(for biological fluid dynamics, see 87.45)

- 76108 The flow of granular materials. III. Rapid shear flows.** S.B.Savage (Dept. of Civil Engng. & Appl. Mech., McGill Univ., West Montreal, Quebec, Canada), R.M.Nedderman, U.Tuzun, G.T.Houlsby. *Chem. Eng. Sci. (GB)*, vol.38, no.2, p.189-206 (1983). The authors consider the case of the rapid flows that occur in chutes and open channels. (48 refs.)
- 76109 Axisymmetric meniscus formation: a viscous-fluid model for cones.** P.T.Squire (School of Phys., Univ. of Bath, Bath, England). *J. Fluid Mech. (GB)*, vol.129, p.91-108 (April 1983). The dynamics of the formation of the axisymmetric meniscus around a cone contacting a free liquid surface are discussed. An approximate phenomenological model is set up. In the case considered, where $Re \ll 1$ and viscosity dominates the retarding forces, this leads to a differential equation relating the height of the circle of contact to time. Solutions are derived, involving one or more unknown parameters, which describe the time dependence of the height of the circle of contact. Experimental data, obtained from delayed flash photographs of the meniscus profiles of silicone fluid climbing over the surface of glass cones, provide general support for the model. The agreement between the predicted and observed height as a function of time is sufficiently close to justify the model as a useful description. (16 refs.)
- 76110 Shear layers in converging flow of fluid of non-uniform density and viscosity.** B.R.Duffy (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England). *J. Fluid Mech. (GB)*, vol.129, p.109-21 (April 1983). The authors present an asymptotic study of steady two-dimensional radial flow between converging plane walls (Jeffery-Hamel flow) when the viscosity μ and density ρ vary with the angular coordinate θ . Two representative situations are considered, the first being a two-layer system (in which μ and ρ are uniform except for discontinuities at an interface $\theta = \theta_0$), and the other involving a fluid for which μ and ρ vary continuously with θ . The flow is analysed in the asymptotic limit when a parameter c related to the wall pressure gradient is large; this corresponds to converging flow at large Reynolds number. Solutions are derived for the boundary layers at the walls and for the shear layer at the interface; the results are shown to agree well with some exact (numerical) profiles. (4 refs.)
- 76111 The evolution of Tollmien-Schlichting waves near a leading edge. II. Numerical determination of amplitudes.** M.E.Goldstein, P.M.Sockol, J.Sanz (NASA, Lewis Res. Center, Cleveland, OH, USA). *J. Fluid Mech. (GB)*, vol.129, p.443-53 (April 1983). For pt.1 see ibid., vol.127, p.59 (1983). It was shown in Part 1 (1983) that the amplitude of the spatially growing Tollmien-Schlichting wave generated by a time-harmonic free-stream disturbance is related to the coefficient multiplying the lowest-order Lam & Rott asymptotic eigensolution of the unsteady boundary-layer equation. In this part the authors use a numerical solution of the unsteady boundary-layer equation to determine that coefficient for the case of a uniformly pulsating stream. (10 refs.)
- 76112 Unsteady laminar flow of a viscous liquid in a symmetrical porous-walled channel of varying width.** O.Prakash (Government Coll., Sambharlake, Rajasthan, India). *J. Math. & Phys. Sci. (India)*, vol.16, no.6, p.605-17 (Dec. 1982). [received: May 1983] The fully developed unsteady flow of a Newtonian incompressible fluid through a symmetrical porous-walled channel of varying width is considered. The flux across a representative section is viewed as composed of a pulsatile part superposed on a steady part and the flow downstream of this section is investigated by expanding vorticity and stream functions in series of powers of the small ratio of the mean channel width to a characteristic length along its axis over which significant changes in flow variables take place. The inertia terms in the equations of motion are retained and their first order effects are estimated. Numerical results computed for a channel having sinusoidal boundary and also for a tapering channel are presented graphically. It is observed that the inertia terms have considerable unsymmetrical effect on skin friction before and after the maximum constriction in the channel, the effect being greatest just at the time of the onset of fresh pulse. This effect is aggravated by increase in the frequency parameter. (11 refs.)
- 76113 Magneto-hydrodynamic flow of liquid metals in curved channels.** K.Sudo (Faculty of Engng., Hiroshima Univ., Hiroshima, Japan), K.Ueda, S.Oshima. *Mem. Fac. Eng. Hiroshima Univ. (Japan)*, vol.8, no.2, p.61-9 (1983). The steady flow of liquid metals in curved channels of rectangular cross-section in the presence of magnetic fields which are applied radially, transversely and axially, is analyzed numerically. The internal mechanism of the flow is made clear and the resistance coefficient which is significant from the engineering standpoint is calculated. Numerical results are obtained and the effects of the magnetic field on the flow are examined. It is found from the results that an applied magnetic field suppresses the secondary flow. Under a radial and a transverse magnetic field, electric currents flow in the direction of a channel axis as well as in the cross sectional plane of the channel. And under an axial magnetic field, three eddies of an electric current appear in the cross sectional plane of the channel. (11 refs.)
- 76114 Multiple solutions and hysteresis in steady parallel viscous flows.** S.H.Davis, G.A.Kriegsmann (Dept. of Engng. Sci. & Appl. Math., Northwestern University, Evanston, IL, USA), R.L.Laurence, S.Rosenblat. *Phys. Fluids (USA)*, vol.26, no.5, p.1177-82 (May 1983). A study is made of flows of viscous fluids when viscosity varies with temperature according to an Arrhenius law, and when viscous dissipation is taken into account. It is shown that for fluids with highly temperature-sensitive viscosity the graph of shear rate against shear stress is an S-shaped curve,

with either one or three values of shear rate for given shear stress. In this situation hysteresis can occur if steady unidirectional flow is maintained. The velocity and temperature profiles are calculated, and the manner in which the temperature-sensitivity parameter affects the conclusions is discussed. The calculations serve as criteria for evaluating the importance of viscous-heating effects in applications. (7 refs.)

- 76115 Free oscillations of a viscous incompressible fluid at the entrance to a pipe with an annular cross section of small curvature.** E.V.Bogdanova (Computing Center, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.533-5 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.556-60 (July 1982). [received: April 1983] Suppose a uniform stream of an incompressible fluid with velocity U_0^* and kinematic viscosity ν^* enters a semi-infinite circular pipe of radius $b^* = 1/2 L^*$ which contains a concentric inner pipe of radius $b^* = 1/2 L^*$ ($L^* \ll b^*$). The author introduces the Reynolds number $Re = U_0^* L^* \nu^{*-1}$, and assumes that it is much larger than unity. Using the basic ideas of the theory of the free interaction of a boundary layer for internal flows, she traces the development of free perturbations at gradually increasing distances from the pipe entrance to steady-state viscous flow. (4 refs.)
- 76116 Flow in curved pipes.** S.A.Berger, L.Talbot (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA), L.-S.Yao. In book: *Annual review of fluid mechanics*. Vol.15, M.Van Dyke, J.V.Wehausen, J.L.Lumley [Ed.], p.461-512. Palo Alto, CA, USA: Annual Reviews (1983), 534 pp. [0 8243 0715 1] Reviews as comprehensively as possible what is known about the flow in curved tubes and pipes. The authors discuss developing and fully developed flows, both steady and unsteady, in rigid infinitely coiled pipes; the flow in finite bends; thermal effects; and more briefly multiphase flow, the flow of non-Newtonian fluids, and the effect of flexible walls. Laminar incompressible flows is their primary concern. They do not consider curved open-channel flows, since they differ enough in analysis and application to receive separate attention. The main emphasis is on tubes or pipes with circular cross sections. (168 refs.)

47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

- 76117 Hypersonic flow behavior in magnetohydrodynamic channel.** E.Xuequan (Inst. of Mech. Acad. Sinica, Peking, China). *Acta Mech. Sin. (China)*, no.2, p.133-43 (1983). In Chinese. For small magnetic Reynolds number and small magnetic interaction parameter the effects of a continuous magnetic field on the hypersonic flow of an inviscid compressible electrical conducting fluid are considered at the entrance region of the channel. Analytical expressions for the electric current density and Lorentz force are obtained by solving the Laplace equation with the complex variable function theory. The conditions for circular electric current are found, and the perturbation equations and the integral formulae of the perturbation parameters derived. The digital solutions of the perturbation equations show that the hypersonic flow has a flow behavior analogous to that of an incompressible fluid. The characteristics of the flow near the specific points are discussed. (5 refs.)
- 76118 The magnetic analogue of Ertel's potential vorticity theorem.** R.Hide (Geophys. Fluid Dynamics Lab., Meteorological Office, Bracknell, England). *Ann. Geophys. (France)*, vol.1, no.1, p.59-60 (Jan.-Feb. 1983). A magnetic field B pervading an electrically-conducting fluid of density ρ moving with Eulerian flow velocity u is shown to satisfy $D\Gamma/Dt = 0$ when Ohm's law holds and the electrical conductivity is infinite. Γ is the 'potential magnetic field', defined as $\nabla \Lambda / \rho$ where Λ is any scalar function satisfying $\Delta \Lambda / Dt \equiv \partial \Lambda / \partial t + u \cdot \nabla \Lambda = 0$ if t denotes time. This result is analogous to Ertel's potential vorticity theorem for an inviscid fluid, namely $D\Pi/Dt = 0$ where $\Pi \equiv \omega \cdot \nabla \Lambda / \rho$ if ω is the absolute vorticity (equal to $\nabla \times u + 2\Omega$ if u is measured in a system that rotates with angular velocity relative to an inertial frame). It is also shown that $D(\rho^{-1} \xi \cdot \nabla G(Z))/Dt = 0$ where $\xi = B$ or ω , $Z = \Gamma$ or Π , and G is any differentiable function of Z . (3 refs.)

76119 Fluid flow and transfer behavior of a drop translating in an electric field at intermediate Reynolds numbers. L.S.Chang, J.C.Berg (Dept. of Chem. Engng., Univ. of Washington, Seattle, WA, USA).

Int. J. Heat & Mass Transfer (GB), vol.26, no.6, p.823-32 (June 1983). Approximate solutions for fluid motion in and around a drop translating in an electric field at an intermediate Reynolds number are obtained using the Galerkin method. Separation angles wake lengths and drag coefficients all vary as a function of the applied field strength. Continuous-phase mass transfer rates for the case of high Peclet numbers are obtained for various values of Reynolds number, viscosity ratio, and a dimensionless parameter W_1 , characterizing the relative importance of electrical and gravitational effects. Only when W_1 is substantially greater than unity is the rate of transport enhanced significantly by the imposed electric field. (13 refs.)

76120 Nonlinear electrohydrodynamic Rayleigh-Taylor instability. I. A perpendicular shear flow in the absence of surface charges. A.el.M.A.Mohamed, E.I.S.El Shehawey (Dept. of Maths., Ain Shams Univ., Heliopolis, Cairo, Egypt).

J. Fluid Mech. (GB), vol.129, p.473-94 (April 1983). Nonlinear electrohydrodynamic Rayleigh-Taylor instability is investigated. A charge-free surface separating two semi-infinite dielectric fluids influenced by a normal electric field is subjected to nonlinear deformations. The authors use the method of multiple-scale perturbations in order to obtain uniformly valid expansions near the cutoff wavenumber separating stable from unstable flows. They obtain two nonlinear Schrodinger equations by means of which one can deduce the cutoff wavenumber and analyse the stability of the system. It is found that if a finite-amplitude wave exists then its small modulation is stable. The authors also obtain the surface elevation for such waves. The electric field plays a dual role in the stability criterion and the dielectric constant plays a distinctive role in this analysis. If the dielectric constant of the upper fluid is smaller than that of the lower fluid the field has a destabilizing effect for large wavenumbers. For relatively smaller wavenumbers the electric field stabilizes considerable parts of the first and second subharmonic regions in the stability diagrams; a result which is in contrast with the linear theory. (29 refs.)

76121 Functional formulation of magnetohydrodynamic turbulence in a rotating frame of reference. Goodarz Ahmadi (Dept. of Mech. & Industrial Engng., Clarkson Coll., Potsdam, NY, USA).

J. Math. & Phys. Sci. (India), vol.16, no.5, p.453-61 (Oct. 1982). [received: May 1983] The functional formulation of magnetohydrodynamic turbulence in a rotating frame of reference is considered. The joint characteristic functional is introduced and Hopf's functional equation is obtained. The reformulation in terms of probability density functional is derived and the generalized Lewis-Krishnan functional formulation is also discussed. (24 refs.)

76122 Steady constantly-inclined MHD flow. O.P.Chandna, H.Toews (Univ. of Windsor, Windsor, Ontario, Canada).

J. Math. & Phys. Sci. (India), vol.16, no.6, p.565-74 (Dec. 1982). [received: May 1983] The authors determine the solutions and the geometries of steady constantly inclined plane flows of a viscous, infinitely conducting fluid when the magnetic lines and their orthogonal trajectories, coincide with the curves that form an isometric curvilinear net. They recapitulate the basic equations governing the motion and derive from these an alternate set of equations suitable for this work. (5 refs.)

76123 Role of hydrodynamic interaction of dispersed particles in structuring processes in alternating electric field. N.I.Gamayunov, V.A.Murtsovkin (Kalinin Polytech. Inst., Kalinin, USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.963-5 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.375-8 (Sept. 1982). A study is made of the process involved in forming of one-dimensional periodic structures as a result of hydrodynamic interaction of dispersed particles and the dependence of this process on the parameters of the external electric field in which it occurs. (5 refs.)

76124 Controlling the oscillations of an inhomogeneous liquid by means of an electric field. S.V.Nesterov, S.Ya.Sekerzh-Zenkovich (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.538-9 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.564-6 (July 1982). [received: April 1983]

It has been noted that regular self-oscillations can be excited at an interface between a dielectric liquid and a conducting liquid by means of a constant electric field. These regular oscillations can be converted to stochastic oscillations by varying the intensity of the electric field. Inasmuch as the natural oscillations depend explicitly on the electric-field intensity, it is natural to assume that an electric field could be used to control the oscillations of an interface between two liquids excited mechanically. To test this assumption the authors have carried out an experiment. (4 refs.)

Transport effects associated with turbulence with particular attention to the influence of helicity See Entry 75994

Magnetohydrodynamic flow of liquid metals in curved channels See Entry 76113

47.70 REACTIVE, RADIATIVE, OR NONEQUILIBRIUM FLOWS

76125 Thermal structure of a flat plate turbulent boundary layer diffusion flame. T.Ueda (Faculty of Sci. & Technol., Keio Univ., Yokohama, Japan), M.Mizomoto, S.Ikai.

Bull. JSME (Japan), vol.26, no.213, p.399-405 (March 1983). Measurements of fluctuating temperature and fluctuating velocity have been made. Results show that a profile of turbulent intensity of temperature fluctuation has two maxima and one minimum. The minimum is located at the station where the gradient of mean temperature is zero. On the other hand, gradients of mean temperature at stations of two maxima are very high. In the region between the flat plate and the flame, the thermal structure is characterized by low frequency fluctuations. In the region between the flame and the edge of the thermal boundary layer, the thermal structure is characterized by high amplitude and high frequency temperature fluctuations. (12 refs.)

76126 A study of the steady-state reaction-zone structure of a homogeneous and a heterogeneous explosive. R.Engelke, J.B.Bdzil (Univ. of California, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.5, p.1210-21 (May 1983). The two-dimensional steady-state reaction-zone structure of a homogeneous and a heterogeneous explosive is studied. To do this theoretical results obtained from the Euler equations of compressible flow are combined with experimental data on steady-state detonation shock-wave speed and shape as a

function of the explosive charge size. The theoretical results, constrained by the experiments, define an inverse problem for the chemical heat-release function in the reaction zone which follows the shock wave; this problem is solved. The heterogeneous explosive is made from the homogeneous one by adding small quantities of other materials. Because of this, the two explosives were closely related in many respects. In spite of this, quite large differences in the detonation characteristics are observed between the two explosives, both in the wave speed as a function of charge size and in the shape of shock-wave loci near the explosive edge. It is found that a single forward rate exponentially dependent on the inverse of the local shock pressure can 'explain' the homogeneous case observations, but that a rate with much less state dependence near the explosive edge is necessary to understand the observations for the heterogeneous material. Near the failure diameter of both materials, prominent structures are found on the experimental shock-wave loci. These structures would seem to be incompatible with a steady flow and call into question whether two-dimensional steady-state detonations occur at all in condensed explosives near their failure diameter. (16 refs.)

Non-equilibrium flow of a vibrationally relaxing gas behind three-dimensional unsteady curved shock wave See Entry 76065

47.80 INSTRUMENTATION FOR FLUID DYNAMICS

76127 Digital image processing of flow visualization photographs. L.Hes-selink (Dept. of Aeronautics & Astronautics, Stanford Univ., Stanford, CA, USA), B.S.White.

Appl. Opt. (USA), vol.22, no.10, p.1454-61 (15 May 1983). This paper is concerned with the propagation of laser light through a slab of randomly varying medium. A theoretical analysis is presented which relates the spectrum of the recorded-intensity field some distance downstream of the medium to the spectrum of the index-of-refraction field. For a homogeneous and isotropic random field, the 3-D spectrum of the medium is obtained from the 2-D spectrum of the photograph by dividing each component of the spectrum by the frequency raised to the fourth power. Free-space propagation outside the random medium is accounted for by a scaling factor. Experimental results are presented which support the theoretical analysis. The nonintrusive diagnostic technique presented here is applicable to photographs which contain partially developed caustic networks. (19 refs.)

76128 Dynamic behaviour and stability of thermistor air flowmeters. A.Catellani, R.Stacchiotti, A.Taroni (Istituto di Fisica, Univ. di Modena, Modena, Italy), C.Canali.

Sens. & Actuators (Switzerland), vol.3, no.3, p.195-202 (May 1983). Experimental measurements of the response time of air flowmeters using both PTC silicon and NTC oxide thermistors as self-heated elements are reported. The dependence of the response time on the thermistor bias conditions and the flow parameters is measured and discussed. Two simple configurations are tested: in the first, the self-heated thermistor is inserted as an active arm of a Wheatstone bridge, with constant voltage bias; in the second (constant temperature difference), a differential amplifier keeps the Wheatstone bridge balanced. The last configuration gives a response time of less than 1 s. Finally, experimental results on the long-term stability of the complete flowmeters and the two types of thermistors are presented. (5 refs.)

76129 Directional gas-flow measurement with pyroelectric anemometers (PA). H.Rahnamai, J.N.Zemel (Moore School of Electrical Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).

Sens. & Actuators (Switzerland), vol.3, no.3, p.203-7 (May 1983). The directional flow characteristics of pyroelectric anemometers, fabricated using z-cut LiTaO₃ plates are studied. The heater resistor and the two sensor electrodes were evaporated NiCr films. The ratios of the lengths of the charge-sensing electrodes to the electrode-heater separation distance β , were 32 and 54. The flow-angle dependence of the difference pyroelectric response was measured. The results yield a $\cos^2 \alpha$ flow-angle dependence, where α is the fluid flow angle normal to the electrode length. Because of the large value of β , this angular dependence is in close agreement with the empirical formula often used for the hot wire anemometer. (7 refs.)

76130 Dynamic particle sizing in suspension by laser anemometry technique. S.L.Lee (Dept. of Mech. Engng., State Univ. of New York, Stony Brook, NY, USA).

Mater. Lett. (Netherlands), vol.1, no.5-6, p.189-93 (April 1983). A new optical particle sizing technique is presented by which in situ local measurements can be made in a suspension of particulates in flow by laser-Doppler anemometry. This technique is unintrusive and produces far more accurate results than conventional collection sizing technique. It is also fast due to the use of digital electronics and real-time data processing and analysis in a minicomputer. Some sample measurement results are also presented. (10 refs.)

76131 An ultrasonic viscometer for the measurement of dynamic shear viscosity of liquids. V.N.Bindal, Mukesh Chandra, J.N.Som (Nat. Phys. Lab., New Delhi, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.176-9 (March 1983). An ultrasonic viscometer for the measurement of dynamic shear viscosity of liquids at 10 MHz frequency over a wide range of temperature has been described. A shear wave reflectance technique at normal incidence has been adopted. A BT-cut quartz crystal along with a fused quartz delay line has been used for generating shear waves. The viscosity measurements performed on glycerine reveal that the results are in good agreement with known accepted values. The viscometer has been found to be capable of measuring viscosity with comparable accuracy under temperature-controlled conditions. The system is reliable and offers potential applications for studying viscoelastic behaviour of liquids in the frequency range (3 to 50 MHz) by incorporating some minor modifications. (14 refs.)

76132 Use of the electromagnetic flowmeter in a two-phase flow. R.N.Bernier, C.E.Brennen (California Inst. of Technol., Pasadena, CA, USA).

Int. J. Multiphase Flow (GB), vol.9, no.3, p.251-7 (June 1983). The use of the transverse field electromagnetic meter for two-phase flows is investigated. It is shown both experimentally and theoretically that this device measures the average velocity of the continuous liquid phase provided this has some minimum electrical conductivity. The calibration is quite independent of void fraction, flow regime, axisymmetric velocity profile, or the electrical conductivity of the continuous liquid phase. The dynamic capability of the meter for use in measuring unsteady two-phase flows is also demonstrated to be considerable. (7 refs.)

- 76133 Cross-correlation flow measurement—a history and the state of the art.** J.Coulthard (Dept. of Electrical Instrumentation & Control Engng., Teesside Polytech., Middlesbrough, England). *Meas. & Control (GB)*, vol.16, no.6, p.214-18 (June 1983). Since the early 1970s, conferences and articles dealing with advances in flow measurement techniques have usually contained a section describing flowmeters which measure the time of flight of fluid disturbances between various types of sensors, using cross-correlation techniques. Up to the present time, no large instrument manufacturer has brought a complete cross-section flowmeter to the market, but current developments may change this situation in the near future. This article summarises the research and development carried out in the recent past, highlights the main problems and indicates the present state of the art. (12 refs.)
- 76134 The instrumentation of a modern fluid mechanics research laboratory.** L. M.P.Escudier (Brown Boveri Res. Centre, Baden-Dattwil, Switzerland). *Meas. & Control (GB)*, vol.16, no.6, p.231-5 (June 1983). Describes the instrumentation to be found in the fluid mechanics research laboratory of the Brown Boveri Research Centre, Switzerland. The article indicates the physical principles of instrumentation intended for the measurement of velocity, pressure, flow rate and shear stress in gas and liquid flows primarily using automated data-acquisition systems. The sensors discussed range from extremely simple in both construction and use (e.g. the total-head tube) to highly complex (e.g. the laser Doppler anemometer). (6 refs.)
- 76135 Theory of capillary viscometer for gases.** K.Shiba, T.Ichinohe, J.Kitamura (Faculty of Engng., Toyo Univ., Kawagoe, Japan). *Oyo Buturi (Japan)*, vol.52, no.1, p.69-74 (Jan. 1983). In Japanese. The correct theory of the capillary viscometer for gases is not yet established, as the customary theory assumes that the increase of volume and the decrease of density of the flowing gas due to the decrease of pressure are negligible, in spite of the decrease of the pressure itself not being negligible. In this paper, at first a differential equation to express Hagen-Poiseuille's law for gases is obtained on the basis that the mass flow rate of gas in the capillary tube, in a steady state, is a function of the distance from the axis of the capillary tube. Then some approximate solutions of the differential equation are obtained which represent approximately the measuring principle of the capillary viscometer for gases. (2 refs.)
- 76136 Measurements of pressure fluctuation in turbulent flow.** T.Komatsu, T.Shibata, M.Ura. *Technol. Rep. Kyushu Univ. (Japan)*, vol.55, no.6, p.569-75 (Dec. 1982). In Japanese. [received: May 1983] The study is concerned with the measurements of pressure in nonsteady three-dimensional water flow. A total head tube is connected to a small semiconductor pressure transducer, which has a high frequency response. Experiments on the directional characteristics of the total head tube are carried out and the results are formulated. Because the pressure detected by the tube is always affected by the dynamic pressure and the inertial effect in the case of nonsteady flow, it is vital to eliminate the effect from the pressure readings. Two dual-sensor hot film probes and the total head tube are put together as closely as possible in order to obtain simultaneous data on the three components of velocity and pressure at almost the same point. The dynamic pressure and the inertial effect are evaluated, so that the latter is neglected because of its smallness. The spectra of pressure fluctuations in the viscous subrange are given by a $-1/3$ power-law. (8 refs.)
- 76137 A volume flow measuring device employing pseudonoise heat impulses.** W.Witte (Univ. Kaiserslautern, Kaiserslautern, Germany). *Tech. Mess. (Germany)*, vol.50, no.4, p.135-41 (April 1983). In German. For the determination of the volume flow rate of a homogeneous fluid the transit time of thermally tagged fluid particles is measured. The tagged fluid particles are low intensity heat impulses constituting a binary pseudonoise sequence. If appropriate sequences are employed and the measuring signals are processed by correlation, the thermal stress of the fluid can easily be limited to about 1K. The applicability of this principle of flow measurement is proved by the determination of the flow rate of diesel oil. (17 refs.)
- 76138 Annular arrays for quantitative pulsed Doppler ultrasonic flowmeters.** Chong-Cheng Fu, L.Gertzberg (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA). *Ultrason. Imaging (USA)*, vol.5, no.1, p.1-16 (Jan. 1983). A theory, based on the Fourier-Bessel series expansion, is developed to synthesize circularly symmetric field patterns by means of concentric annular arrays. The application of this theory to the formation of variable-width uniform sector beams is studied in detail and results in a canonical design procedure. Calculated beam patterns are compared to the actual measured patterns obtained from a prototype array suitable for transcutaneous investigation of the central blood-flow system and are observed to be in good agreement. The implementation of such arrays in the compensated-first-moment flowmeter is described. Methods of beam-pattern improvement are also discussed. (14 refs.)
- 76139 Electromagnetic non invasive measurement: application to flow measurement.** M.L.Sanderson (Dept. of Electronic & Electrical Engng., Univ. of Salford, Salford, England). Colloquium on 'Non-Invasive On-Line Measurement in Industry', London, England, 13 April 1983 (London, England: IEE 1983), p.6/1-4 Describes the development of a capacitively coupled electromagnetic flowmeter which is suitable for non-intrusive industrial measurements. Problems associated with the electronic detection system and spurious signals picked-up by the high impedance levels are discussed. It is suggested that the flowmeter can be modified for use with dielectric liquids using the displacement current rather than the conduction current. (3 refs.)
- 76140 Laser diode frequency modulation for directional laser doppler velocimetry.** J.D.C.Jones, M.Corke, A.D.Kersey, D.A.Jackson (Univ. of Kent, Canterbury, England). First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.178-81 The phenomenon of current induced frequency modulation in laser diodes has been exploited to produce a compact solid state LDV system, which provides the frequency shifting required for direction sensing by electronic means, and without additional components. A simple modification of the apparatus to produce an optical fibre launched LDV system is described. (5 refs.)
- 76141 Differential Doppler velocimetry using polarization-preserving optical fiber.** A.A.Boiarski, S.A.Kingsley (Battelle Columbus Labs., Columbus, OH, USA). First International Conference on Optical Fibre Sensors, London, England, 26-28 April 1983 (London, England: IEE 1983), p.214-16 Describes a unique fibre optic laser Doppler anemometer (FOLDA) device which employs two single-mode input fibers and a single multimode collecting fiber. This device uses a differential backscattering LDA configuration. The

authors also present velocity measurement results for a case of practical interest. (9 refs.)

51.00 KINETIC AND TRANSPORT THEORY OF FLUIDS; PHYSICAL PROPERTIES OF GASES

51.10 KINETIC AND TRANSPORT THEORY

- 76142 Alignment of diatomic molecules by gaseous transport.** A.J.Bain, A.J.McCaffery (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.239-42 (13 May 1983). Iodine molecules in a flow cell containing helium as a carrier gas appear to be partially aligned. This has been determined by comparison of circular polarisation ratios of rotationally resolved emission lines in the flow cell with those obtained from a similar cell containing I_2 in an isotropic environment. After all other possibilities have been eliminated, two experimental indicators of alignment remain. One is the reduction of the absolute value of the circular polarisation ratio and the other is the differential reduction of one of the P,R-doublet emission lines. (16 refs.)
- 76143 Barodiffusion in a binary mixture due to rotation of a circular cylinder.** A.C.Srivastava (Dept. of Math., Dibrugarh Univ., Dibrugarh, India). *J. Math. & Phys. Sci. (India)*, vol.16, no.5, p.463-7 (Oct. 1982). [received: May 1983] The diffusion effect in a binary mixture of incompressible viscous fluids filling the space outside a circular cylinder rotating with a constant angular velocity has been discussed. The case when the mixture is bounded by another stationary circular cylinder has also been discussed. In both the cases it is assumed that the flow is laminar and stable. It has been found that the effect of the pressure gradient created by the rotation of the cylinder is to separate the mixture because of their different densities; the lighter component gets collected near the rotating cylinder. (3 refs.)
- 76144 Measurements of the mutual diffusion coefficients of a nonideal gas mixture of helium and carbon dioxide.** A.G.Karpushin, Sh.K.Bibolov (S.M. Kirov Kazakh State Univ., Alma-Ata, USSR). *J. Eng. Phys. (USA)*, vol.43, no.3, p.1017-19 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.443-7 (Sept. 1982). The authors consider a method for the calculation of the mutual diffusion coefficient of nonideal gases. A formula is presented for the barometric dependence of the helium-carbon dioxide system. (12 refs.)
- 76145 Time correlation functions for the one-dimensional Lorentz gas.** R.M.Mazo, H.van Beijeren (Inst. für Theoretische Phys. A & B, RWTH Aachen, Aachen, Germany). *Physica A (Netherlands)*, vol.119A, no.1-2, p.197-211 (April 1983). The velocity autocorrelation function and related quantities are investigated for the one-dimensional deterministic Lorentz gas, consisting of randomly distributed fixed scatterers and light particles moving back and forth between two of these at a constant given speed. An expansion for the velocity autocorrelation function given by Grassberger, which is useful for short times, is reconstructed. The long time behavior is investigated by Fourier transform techniques. (22 refs.)
- 76146 Computed energy and spatial statistical properties of stored ions cooled by a buffer gas.** F.Vedel, J.Andre, M.Vedel, G.Brincourt (Univ. de Provence, Phys. des Interactions Ioniques et Moléculaires, Marseille, France). *Phys. Rev. A (USA)*, vol.27, no.5, p.2321-30 (May 1983). The authors describe a three-dimensional model, based on the temporal invariance of the statistical properties, which allows one to calculate the spatial and energy probability densities of strongly confined ions in the presence of a buffer gas. This model is then applied to a population of Cs^+ ions for which the authors compute these densities within the whole stability diagram and for various gases. In the case of helium, in particular, the authors show that these laws can be described by Gaussian functions, and they present the evolution of the temporal average of the spatial dispersions and ionic temperatures at the working point. (27 refs.)

- 76147 Bound states in a classical gas.** N.B.Gorev, A.I.Sokolovskii. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.4, p.617-18 (April 1983). In Russian. On the basis of the theory for density excitations for the case of a classical gas of particles interacting by way of a pair potential of the rectangular well type with a solid core, the authors have obtained expressions for the number of connected pairs (molecules) as well as for the high temperature asymptotics. 51.20 VISCOSITY AND DIFFUSION: EXPERIMENTAL

- 76148 The viscosity and diffusion coefficient of binary mixtures of nitrous oxide with He, Ne and CO.** J.Kestin (Div. of Engng., Brown Univ., Providence, RI, USA), W.A.Wakeham. *Ber. Bunsenges. Phys. Chem. (Germany)*, vol.87, no.4, p.309-11 (April 1983). Absolute measurements are reported of the low-density viscosity of binary mixtures of nitrous oxide with helium, neon and carbon monoxide in the temperature range 25 to 200°C. The viscosity data, which have an accuracy of $\pm 0.3\%$, are employed to confirm that the three systems, involving a weakly polar component, may be incorporated into the correlation scheme of the KRW law of corresponding states. The scaling parameters σ_{ij} and ϵ_{ij} which secure the optimum representation of the data by means of the universal collision integral Ω_{22} are derived. The internally consistent binary diffusion coefficients, calculated from the mixture viscosity, may themselves be successfully represented with the aid of the universal collision integral Ω_{11} . (16 refs.)
- 76149 Measurements of the viscosity of compressed gaseous and liquid nitrogen.** D.E.Diller (Nat. Engng. Lab., NBS, Boulder, CO, USA). *Physica A (Netherlands)*, vol.119A, no.1-2, p.92-100 (April 1983). The shear viscosity coefficients of compressed gaseous and liquid nitrogen have been measured with a torsional piezoelectric quartz crystal viscometer at temperatures between 90 and 300K and at pressures up to 30 MPa (4350 psia). The measurements have been compared with other measurements; with a correlating equation, previously proposed for calculating the viscosities of pure compressed gaseous and liquid nitrogen; and with an extended corresponding states model, previously proposed for calculating the viscosities of fluid mixtures. (14 refs.)

Aero-diffusion method of estimating evaporation in a non-stratified atmosphere See Entry 78565

51.30 THERMAL PROPERTIES OF GASES

- 76150 Parametric scaled equation of state of restricted cubic model.** Zhou Xuehua (Inst. of Mech., Acad. Sinica, Peking, China). *Acta Mech. Sin. (China)*, no.2, p.173-8 (1983). In Chinese. A new method of calculating specific heat at constant volume near the critical point of a fluid is presented. The calculated specific heat of CO_2 agrees well with the measured value. (12 refs.)
- 76151 New values for the thermodynamic parameters of water vapor.** D.Sonnag. *Meas. Tech. (USA)*, vol.25, no.9, p.764-7 (Sept. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.9, p.54-6 (Sept. 1982). [received: May 1983] Unification of physical quantities in international practice extends both to the numerical values and to the units of measurement. The revision of these quantities has required reconsideration of the data on the thermodynamic parameters of water vapor. A method of obtaining the new thermodynamic parameters based on the use of the Clausius-Clapeyron equation is described and the resulting formulas are discussed with regard to the accuracy obtained. (16 refs.)
- 76152 A class of systems with a large autorecuperation coefficient.** V.A.Namiot. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1430-1 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2319-20 (Nov. 1982). [received: May 1983] The phenomenon of autorecuperation may be observed whenever a modulated beam of charged particles is incident at an appropriate angle on a plasma or gas target. When autorecuperation takes place, some of the energy lost by the beam in collisions with the particles in the medium is returned to the beam. Since the number of nuclear reactions occurring in the target is proportional to the number of collisions, the effective energy loss per nuclear reaction is thus reduced. The decrease in the energy loss is described by the autorecuperation factor η_{arc} , which is defined as the ratio of the energy returned to the beam divided by the total energy lost in collisions with particles in the target. The closer η_{arc} is to unity, the more efficiently the beam energy is utilized. The processes responsible for autorecuperation was studied by the author (1982) in the linear approximation, which is only applicable when $\eta_{arc} \ll 1$. It therefore remains unclear if it is possible to have a situation with $\eta_{arc} \sim 1$. Indeed, when nonlinear effects are included qualitatively new behavior may occur, such as shock wave formation or breakage of the target material, which greatly increase the energy dissipation inside the target and hence reduce η_{arc} . The author now considers a very simple example which is easily treated analytically and involves indirect autorecuperation in a nonideal gas (i.e. autorecuperation when an intermediate system is present). For this example, values $\eta_{arc} \sim 1$ can be achieved. (2 refs.)

(see also 52. Plasma and electric discharges)

- 76153 Dielectric strength of gas mixtures comprising SF_6 , CO_2 , C_2F_6 and SF_6/N_2 , C_2F_6 .** Y.Qiu (Xi'an Jiaotong Univ., Xi'an, China), E.Kuffel. *IEEE Trans. Power Appar. & Syst. (USA)*, vol.PAS-102, no.5, p.1445-51 (May 1983). In a previous paper breakdown strengths of $\text{C}_2\text{F}_6/\text{SF}_6/\text{CO}_2$ gas mixtures in various proportions were reported for a 30 mm rod-sphere gap under AC and impulse voltages. A mixture of 1% C_2F_6 + 59% SF_6 + 40% CO_2 exhibited higher dielectric strength than pure SF_6 in the pressure range between 350

and 400 kPa. The present paper compares CO_2 and N_2 as a buffer in gas mixtures and extends the studies to a nearly uniform field gap and a highly non-uniform field gap. Additional experiments confirmed that the use of CO_2 as a buffer in gas mixtures is superior to N_2 and that some $\text{C}_2\text{F}_6/\text{SF}_6/\text{CO}_2$ gas mixtures have higher dielectric strength and are cheaper than pure SF_6 . 52.20F Electron collisions

- 76155 Effects of a constant magnetic field on electron-electron collisions.** K.Matsuda (GA Technol. Inc., San Diego, CA, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1247-51 (May 1983). The Rostoker equation has been numerically compared with the Fokker-Planck equation for a plasma with axially symmetric velocity distributions by computing electron slowing-down rates and velocity-space diffusion rates due to collisions with background electrons. The results in a case of $\Omega_e \sim \omega_{pe}$ agree well with the corresponding quantities obtained from the Fokker-Planck operator. In the case of a strongly magnetized plasma ($\Omega_e \gg \omega_{pe}$), the results indicate corrections to the Fokker-Planck coefficients which are different from the one suggested by a previous work. 52.25 PLASMA BASIC PROPERTIES

- 76156 The two-dimensional one-component plasma at $\Gamma=2$: behavior of correlation functions in strip geometry.** P.J.Forrester (Dept. of Math., Univ. of Melbourne, Parkville, Victoria, Australia), B.Jancovici, E.R.Smith. *J. Stat. Phys. (USA)*, vol.31, no.1, p.129-40 (April 1983). The authors consider a strip of two-dimensional one-component plasma of particles of charge q at a temperature T such that the coupling constant be $\Gamma = q^2/k_B T = 2$. The strip is of finite width and infinite length and bears charge densities on either edge. Inside the strip and on one side, the dielectric constant is 1; on the other side of the strip, it may be either 1 or 0 (in the latter case, image forces play an important role). The free energy as well as the one-particle and two-particle distribution functions can be exactly computed. They obey a variety of sum rules reflecting the Coulombic behavior of the system. At large separations the truncated two-particle distribution function behaves with algebraically decaying oscillations. The strip of finite width in fact is correlated along the strip much as a one-dimensional system is correlated. (17 refs.)
- 76157 Parameter optimizations of multiple-mirror reactors.** F.Najmabadi, A.J.Lichtenberg, M.A.Lieberman (Univ. of California, Berkeley, CA, USA). *Nucl. Fusion (Austria)*, vol.23, no.5, p.609-31 (May 1983). The diffusion density profile model for multiple-mirror devices is limited to machines with a large number of cells and high mirror ratios. A new discrete staircase density profile model, without those limitations, has been developed.

This model, along with the diffusion model, has been used to study the parameters of steady-state multiple-mirror reactors. A linear fusion device consisting of a central solenoid and multiple mirrors at each end has been considered. The magnetic field is taken to be produced by a solenoid and mirror-quadrupole assemblies which produce an average-minimum-B stable configuration. Different means of supplying the re-circulating power, including high-energy neutral-D injectors, are considered. Distribution functions of alpha particles and beam particles in this machine have been calculated. Trade-offs among the length of the machine, Q =fusion power/beam power, and other machine parameters in two different operating modes; wetwood burner (pure-T plasma background) and conventional (T and D background plasma), have been studied. It is found that the staircase density profile results in shorter reactors with a larger number of cells, compared to those of the diffusion-determined density profile. (14 refs.)

76158 Generalized Klimontovich theory for fluctuations and correlations in plasmas. A.J.D.Lambert (Dept. of Appl. Phys., Tech Hogeschool, Eindhoven, Netherlands).

Physica A (Netherlands), vol.119A, no.1-2, p.177-96 (April 1983).

In order to deal with a non-ideal plasma a method is developed that gives a microscopic hierarchy of equations for the fluctuation in density of a classical plasma, existing of pointlike particles. Starting from the evolution equations of a Fourier-transformed one-particle distribution function, expressions for every correlation function can be found in a straightforward way. Results like the Landau- and the Lenard-Balescu collision integral and the time-dependent correlation functions of Rostoker are recovered when the hierarchy in the lowest significant order is cut off. (11 refs.)

76159 Surface density profile and surface tension of the one-component classical plasma. P.Ballone (Scuola Internazionale Superiore di Studi Avanzati, Trieste, Italy), G.Senatore, M.P.Tosi.

Physica A (Netherlands), vol.119A, no.1-2, p.356-68 (April 1983).

The density profile and the interfacial tension of two classical plasmas in equilibrium at different densities are evaluated in the square-density-gradient approximation. For equilibrium in the absence of applied external voltage, the profile is oscillatory in the higher-density plasma and the interfacial tension is positive. The amplitude and phase of these oscillations and the magnitude of the interfacial tension are related to the width of the background profile. Approximate representations of the equilibrium profile by matching of its asymptotic forms are analyzed. A comparison with computer simulation data and a critical discussion of a local density theory are also presented. (13 refs.)

52.25F Transport properties

76160 A one-dimensional study of Tokamak current reversal. L.R.O.Storey (Inst. Nat. de Recherche Sci., Varennes, Quebec, Canada).

Can. J. Phys. (Canada), vol.61, no.5, p.671-9 (May 1983).

The possibility of being able to reverse the toroidal current in a Tokamak, without undue loss of plasma, is studied using diffusive magnetohydrodynamics (MHD), together with a one-dimensional model in which the torus is represented by a long cylindrical slab. For a plasma with free surfaces, it predicts that the entire plasma will expand outwards and be lost before the current even changes sign. However, interaction of the outer surface with conducting limiters can impede the expansion, and other ways of preserving the plasma may exist in two dimensions, so current reversal may be feasible after all. (16 refs.)

76161 Screening effect of degenerate electron background in high density plasmas. III. Local field correction due to electron interaction. S.Chimaru, H.Iyetomi (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1730-3 (May 1983).

For pt.II see ibid., vol.50, p.3778 (1981). Local-field correction due to the exchange and correlation effects between electrons introduces the screening function for the electron-ion interaction different from that for the ion-ion interaction. The resulting corrections to the calculation of the electric resistivity are numerically investigated. It is found that the corrections are substantial in magnitude even at the electron density ($n_e \approx 1$) of relatively weak coupling. (16 refs.)

76162 Heavy-impurity transport in the TFR Tokamak—comparison of line emission with numerical simulations.

Nucl. Fusion (Austria), vol.23, no.5, p.559-69 (May 1983).

Heavy-element ion line emissions are simulated with a numerical code using two adjustable, radius-independent parameters in the flux density expression: an anomalous diffusion coefficient D_A and an inward convective velocity V_A . Previously reported results on the laser blow-off injection of V, Cr, and Ni are, thus, interpreted. The quasi-stationary phase of Ohmically heated high-density ($n_0 \approx 1.5 \times 10^{14}$ cm $^{-3}$) discharges is also simulated, thus allowing the plasma impurity content and the radiated power to be calculated. The necessary numerical values of D_A and V_A are in the range of 2000-4000 cm 2 s $^{-1}$ and 400-800 cm.s $^{-1}$, respectively. (18 refs.)

76163 Transport and re-deposition of limiter-released metal impurities. H.A.Claassen, H.Repp (Inst. für Plasmaphys., KFA Jülich GmbH, Jülich, Germany).

Nucl. Fusion (Austria), vol.23, no.5, p.597-607 (May 1983).

The transport and re-deposition of limiter- (or divertor-target)-released metal impurities in a given counter-streaming scrape-off layer plasma is studied analytically by using a kinetic approach. Electron impact ionization, Coulomb collisions with the hydrogen ions, and impurity ion acceleration in a pre-sheath electric field are accounted for. The friction and electric-field forces provide the driving forces for impurity re-cycling in front of the limiter. Both hydrogen ion sputtering and self-sputtering are included (the latter for impurity emission perpendicular to the limiter surface). The analytical formulas are numerically evaluated for the example of sputtered iron impurities, assuming a simple model for a scrape-off layer plasma in contact with a stainless-steel poloidal ring limiter. (10 refs.)

76164 Ripple loss of suprathermal alpha particles during slowing-down in a Tokamak reactor. K.Tani, T.Takizuka, M.Azumi, H.Kishimoto (JAERI, Ibaraki, Japan).

Nucl. Fusion (Austria), vol.23, no.5, p.657-65 (May 1983).

The slowing-down process of suprathermal alpha particles in a rippled toroidal field is investigated by means of an orbit-following Monte Carlo code. It is found that numerical results on the collisionless ripple loss agree fairly well with the theoretical predictions. The collisional diffusion coefficient for non-ergodic banana particles in a field ripple is derived. The ripple-enhanced power loss of alpha particles during slowing-down amounts to 10% of their total power in a reactor-grade Tokamak with a toroidal-field ripple of $\delta \sim 1\%$. The fraction of particle loss is 1.5 to 1.8 times as large as that of power loss. The ripple-enhanced banana drift dominates the alpha-particle loss process. (22 refs.)

76165 Enhanced diffusion in strongly magnetized plasmas. G.Fromling (Inst. für Theoretische Phys., Ruhr-Univ. Bochum, Bochum, Germany).

Phys. Fluids (USA), vol.26, no.5, p.1240-6 (May 1983).

Particle diffusion transverse to a strong uniform magnetic field is studied within a three-dimensional electrostatic guiding-center model in which particle streaming along the magnetic field lines is admitted as well as transverse $E \times B$ drifting. Only the randomizing influence of thermal fluctuations excited by particle discreteness is considered. The electric field autocorrelation coefficient is obtained in the form of a modified fluctuation-dissipation theorem. It is shown that because of the competition between the parallel and perpendicular decorrelation mechanisms, the divergence of the diffusion coefficient in the previous finite-volume theories disappears. The diffusion coefficient is Bohm like (proportional to $1/B$) for magnetic fields which are not too strong, and goes over to a classical variation (proportional to $1/B^2$) in the limit $B \rightarrow \infty$. (29 refs.)

76166 Effect of impurities on heat and particle transport in Tokamaks. A.V.Nedospasov (Inst. of High Temperatures, Acad. of Sci., USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.450-1 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1045-8 (Sept. 1982).

[received: May 1983]

The plasma diffusion coefficients and the electronic thermal conductivities observed in tokamaks have yet to be convincingly explained. The authors discuss the hypothesis that transport in a tokamak is affected by a current-driven turbulent convection caused by impurities. (6 refs.)

76167 Effect of self absorption on emitted intensity of Na-5890 Å line in water gas combustion plasma. N.K.Joshi, V.K.Rohatgi (Plasma Phys. Section, Bhabha Atomic Res. Centre, Bombay, India).

Int. J. Energy Res. (GB), vol.7, no.2, p.155-61 (April-June 1983).

Numerical calculations have been carried out to explain the effect of self absorption on the nature of the emitted intensity of the Na-5890 Å line of the sodium doublet in water gas combustion plasma. The self absorption is purely an effect caused by the presence of cold wall boundary layers in an MHD duct. The effect of seed concentration, core temperature, wall temperature, boundary layer thickness and profile parameters on line shapes has been studied. It has been found that seed percentage is the major factor influencing the line shape parameters and core temperature is the major factor affecting the maximum radiated monochromatic line intensity. (7 refs.)

JETP Lett. (USA), vol.36, no.7, p.281-4 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.229-32 (5 Oct. 1982).

[received: May 1983]

The broadening of the resonance line of the helium-like ion of phosphorus emitted by a laser plasma is discussed. The broadening is interpreted as a Doppler frequency shift of the emission of high-energy P^{+13} ions. The energy spectrum of these fast ions is determined. The temperature of the electrons responsible for the ion acceleration is estimated. (10 refs.)

76169 Bright light sources from shock deceleration of hypersonic plasma streams in dense gases. A.S.Kamrukov, N.P.Kozlov, Yu.S.Protasov, A.M.Semenov (N.E. Bauman Higher Tech. Coll., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1427-8 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2314-17 (Nov. 1982).

[received: May 1983]

The authors study the possibility of designing a light source with brightness characteristics comparing favorably with the most intense shock wave sources but without the disadvantages of explosive sources. Such a light source can be achieved by shock deceleration of hypersonic plasma streams in dense gases. (5 refs.)

(see also 47.65 Fluid dynamics)

- 76170** Approximations in magnetoionic theory. K.G.Budden (Cavendish Lab., Univ. of Cambridge, Cambridge, England). *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.4, p.213-18 (April 1983). Approximate formulae exist for the two refractive indices and the two wave polarizations in a cold magnetoplasma, known as the quasi-longitudinal and quasi-transverse approximations. Some of the commonly used forms of these formulae are wrong. The correct versions are given and the range of their validity is examined. (7 refs.)
- 76171** Finite-aspect-ratio MHD equations for Tokamaks. H.R.Strauss (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA). *Nucl. Fusion (Austria)*, vol.23, no.5, p.649-55 (May 1983). A consistently ordered set of reduced MHD equations is derived for finite-aspect-ratio Tokamaks. The equations correctly reproduce Merier's low-beta interchange stability criterion. A numerical application to Tokamak ballooning stability is given. Finite-aspect-ratio effects tend to be stabilizing at low beta and destabilizing at high beta. (18 refs.)
- 76172** Inertial and viscous effects in the nonlinear growth of the tearing mode. D.Edery, M.Frey, J.P.Somon, M.Taggar, J.L.Soule (CEA, Centre d'Etudes Nucleaires, Fontenay-aux-Roses, France), R.Pellat, M.N.Bussac. *Phys. Fluids (USA)*, vol.26, no.5, p.1165-7 (May 1983). The nonlinear self-similar tearing-mode solution of Rutherford (1973) is revisited. The stream function for the plasma flow including inertia, convection, and viscosity is explicitly computed. In all cases Rutherford's solution is asymptotically valid. (7 refs.)
- 76173** Observations of magnetized plasma flow through stationary background plasma. G.Jellison, C.R.Parsons (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1171-2 (May 1983). The collisionless flow of a laser-produced barium plasma through low-pressure photoionized xenon in the presence of a uniform, transverse magnetic field is studied. Deceleration of the barium is observed, and attributed to magnetically induced instabilities. Interaction close (4 cm) to the target is observed. The front thickness is observed to vary inversely with field strength. Spontaneous emission of 4554.03 Å radiation increases by more than an order of magnitude when the B field and background gas are both present, indicating significant electron heating. Theory shows that these observations can be explained by the modified two-stream instability and the magnetized ion-ion instability. (10 refs.)
- 76174** Magnetohydrodynamic equilibrium and stability of field-reversed configurations. J.L.Schwarzmeier, D.C.Barnes, D.W.Hewett, C.E.Seyler, A.I.Shestakov, R.L.Spencer (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1295-8 (May 1983). Magnetohydrodynamic equilibrium and stability studies of field-reversed configurations are presented. Experimentally realistic equilibria are calculated numerically for a plasma inside a conducting cylinder. Stability studies indicate that equilibria ranging from elliptical to highly racetrack-shaped are all unstable to the internal tilting mode. (15 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

- 76175** Comment on 'Electromagnetic decay into a surface plasma wave and an ion acoustic surface wave in a semi-infinite plasma'. E.Mateev, I.Zhelyazkov (Faculty of Phys., Sofia Univ., Sofia, Bulgaria). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2837 (May 1983). For original paper see K. Yasumoto, *ibid.*, vol.52, p.3238 (1981). It is pointed out that the parametric instability of surface modes in a semi-infinite plasma is a four-wave process and the threshold should be $\sim 0.7(m_i/m_e)^{1/2}$ times larger than that found by Yasumoto [*J. Appl. Phys.* 52, 3238 (1981)]. (4 refs.)
- 76176** Buneman instability and Pierce instability in a collisionless bounded plasma. S.Iizuka, K.Saeki, N.Sato, Y.Hatta (Dept. of Electronic Engng., Tohoku Univ., Sendai, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1618-28 (May 1983). A systematic experiment is performed on the Buneman instability and the Pierce instability in a bounded plasma consisting of beam electrons and stationary ions. Current fluctuations are confirmed to be induced by the Buneman instability. On the other hand, the Pierce instability gives rise to a current limitation. The phenomena are well explained by Mikhailovskii's theory taking account of ion motion in a bounded plasma.
- 76177** Influence of external helical field on the tearing mode. Ma Tengcai, Long Yongxing (Southwestern Inst. of Phys., Acad. Sinica, Leshan, China). *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.3, p.316-20 (March 1983). It has been found that in many Tokamak discharges a strong correlation exists between the tearing modes and the current disruption. The disruption is initiated by the current in helical windings, and a small resonant helical field will exert a stabilizing effect on the disruptive instability if it is not too large. Thus, in a Tokamak and in systems with external windings, such as stellarators, analyses of the influence of the helical field on the 2/1 mode have been considered important. The authors attempt to explain the behaviour of the

2/1 mode on the basis of the nonlinear theory of tearing modes, and take into consideration the effect of the external helical field and the resonant interaction between plasma and helical field. (7 refs.)

- 76178** A kinetic cross-field streaming instability. C.S.Wu, Y.M.Zhou, S.T.Tsai, S.C.Guo (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), D.Winske, K.Papadopoulos. *Phys. Fluids (USA)*, vol.26, no.5, p.1259-67 (May 1983). In a high-beta plasma, the so-called modified two-stream instability, which results from strongly magnetized electrons drifting relative to unmagnetized ions across a homogeneous magnetic field, is misnamed because the mode is highly kinetic, particularly when the relative streaming velocity exceeds the Alfvén speed of the plasma. This kinetic cross-field streaming instability is investigated in detail, examining the effect of the electromagnetic terms and the stability boundaries in both low- and high-beta plasmas. An approximate dispersion relation showing the relation of this mode to the whistler is derived and solutions of it are compared with those obtained from the exact dispersion relation. The kinetic mode, unlike the usual modified two-stream instability, is not stabilized by electromagnetic effects when the relative electron-ion drift speed exceeds the Alfvén speed. (31 refs.)
- 76179** Linear analysis of the coalescence instability. A.Bondeson (Inst. for Electromagnetic Field Theory, Chalmers Univ. of Technol., Goteborg, Sweden). *Phys. Fluids (USA)*, vol.26, no.5, p.1275-8 (May 1983). The linear instability of pairwise-coalescing magnetic islands is studied analytically and numerically using incompressible ideal magnetohydrodynamics. An energy principle calculation shows that for small values of the island width w , the growth rate of the instability is proportional to $w^{3/2}$. Numerical simulations are presented giving detailed information about the mode structure. (11 refs.)
- 76180** Nonlinear evolution of the transverse instability of plane-envelope solitons. P.A.E.M.Janssen (Dept. of Oceanography, Royal Netherlands Meteorological Inst., De Bilt, Netherlands), J.J.Rasmussen. *Phys. Fluids (USA)*, vol.26, no.5, p.1279-87 (May 1983). The nonlinear evolution of the transverse instability of plane envelope soliton solutions of the nonlinear Schrödinger equation is investigated. For the case where the spatial derivatives in the two-dimensional nonlinear Schrödinger equation are elliptic a critical transverse wavenumber is found above which the soliton is stable. Application of the multiple time scale method near this critical transverse wavenumber gives a dynamical equation for the nonlinear evolution of the transverse instability. Nonlinearity is found to enhance the growth of the linearly unstable mode. The results are discussed in connection with soliton collapse. (25 refs.)
- 76181** Suppression of magnetic islands by RF driven currents. A.H.Reiman (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1338-40 (May 1983). The quasilinear theory for the saturation of nonlinear tearing modes is modified to include RF driven currents. It is shown that the presence of lower hybrid driven currents can strongly suppress the growth of magnetic islands. (4 refs.)
- 76182** Zero-frequency cyclotron wave on an intense relativistic-electron beam. T.P.Starke, H.V.Wong, W.W.Rienstra, B.N.Moore, E.Cornet, H.A.Davis (Austin Res. Associates, Austin, TX, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1349-58 (May 1983). The zero-frequency cyclotron wave is studied on an unneutralized, magnetized relativistic-electron beam. This stationary mode occurs where the Doppler-shifted beam-cyclotron dispersion branch crosses the wavenumber axis. In this experiment zero-frequency-cyclotron waves have been generated by the injection of foil (and foilless) diode beams into a drift tube. A linear-cyclotron wave-dissipation theory is presented, which includes the radial electron-energy variation $\gamma(r)$ due to beam space charge. The $\gamma(r)$ variation causes only one propagating eigenmode to exist for each azimuthal-mode number. Numerical simulations of the beam and the cyclotron wave are described. Experimental measurements of the mode radial dependence, the wavelength scaling with magnetic field, and the wavelength scaling with beam energy are also presented. (15 refs.)
- 76183** Field saturation for arbitrary temperature in resonance absorption. B.Bezzerides, S.J.Gitomer (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1359-63 (May 1983). A nonlinear theory of a driven, inhomogeneous, one-dimensional plasma of arbitrary temperature is presented. The model is solved numerically and analytically and detailed expressions are given for the saturated electric field excited at critical density. The results of the calculation are valid for arbitrary temperature and connect in a continuous manner the limits of cold wavebreaking and linear convective saturation. Comparison of the results of the calculation with particle simulations is made and good agreement is obtained. (7 refs.)
- 76184** Growth and saturation of the two-plasmon decay instability. H.A.Baldis, C.J.Walsh (Div. of Phys., Nat. Res. Council, Ottawa, Ontario, Canada). *Phys. Fluids (USA)*, vol.26, no.5, p.1364-75 (May 1983). An experimental study of the two-plasmon decay instability is reported. An intense CO₂ laser (10.6 μ m) was used to generate the instability in a long scale length, preformed plasma. The principal experimental diagnostic measurement was time-resolved Thomson scattering, with resolution in either ω or k space. The results show that the instability evolves basically in agreement with linear theories, then saturates by the nonlinear process of mode coupling to short-wavelength ion fluctuations. At saturation, density fluctuations close to 20% are observed in both the electron and ion waves. (27 refs.)
- 76185** Nonlinear saturation of the Pierce instability. D.Jovanovic (Inst. of Phys., Beograd, Yugoslavia). *Phys. Scr. (Sweden)*, vol.27, no.5, p.376-9 (May 1983). The early stage in the saturation of the Pierce instability is investigated assuming weak nonlinearities. It is demonstrated that the energy transfer to the growing electric potential causes a deceleration of the electron beam, leading to enhancement of the potential and decrease of the wavelength close to the beam inlet boundary. The possible relationship between this effect and the formation of double layers is discussed. (10 refs.)
- 76186** Low frequency surface waves in the presence of an external high frequency electric field [plasma]. N.Gopalaswamy, S.Krishan (Dept. of Phys., Indian Inst. of Sci., Bangalore, India). *Pramana (India)*, vol.20, no.1, p.23-40 (Jan. 1983). [received: May 1983] The problem of surface sound propagation in the presence of external high frequency dipole electric field is investigated using Vlasov-Poisson equations. The structure of the electric field of these surface waves is also determined. It has been found that the ion sound waves that exist in the presence of external high frequency waves are true surface waves while those without the external

field are quasisurface waves as the former waves decay within one wavelength away from the surface. (12 refs.)

76187 Transmission of sonics through ionised medium: damping considerations. A.P.Saxena, N.S.Suryanarayana (Ravishankar Univ., Raipur, India). *Pramana (India)*, vol.20, no.1, p.41-6 (Jan. 1983). [received: May 1983] The various energy loss mechanisms in ion acoustic wave propagation in a gas discharge plasma have been discussed. The relative characteristic acoustic impedance of the plasma has also been experimentally determined which would help to measure the electron temperature of the plasma. (14 refs.)

76188 Self-excited oscillations in the parameters of a laser plasma near the target surface in gases at high pressure. N.N.Rykalin, A.A.Uglov, M.B.Ignat'ev (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.628-9 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1117-19 (Aug. 1982). [received: May 1983]

Reports an experimental study of the spatial inhomogeneity of a laser plasma in gases at high pressure, based on the use of probe measurements. A pulsed neodymium laser was used in the experiments; it emitted pulses of length $\tau \sim 0.5$ -1.0 msec with maximum energy of 30 J at wavelength $\lambda = 1.06 \mu\text{m}$. (9 refs.)

76189 Drift motion of a charged particle in a homogeneous magnetic field and in the electric field of the rotating potential wave. Yu.N.Eliseev, K.N.Stepanov.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.683-92 (May 1983). In Russian. Drift equations describing the motion of a nonrelativistic charged particle in the homogeneous magnetic field and in the electric field of a rotating potential wave under the Cherenkov and cyclotron resonance conditions are obtained by means of the averaging method. The drift motion integrals are found and the drift trajectory being a part of an ellipse or a hyperbola is determined on the phase plane. Time integration of the drift equations is performed for a monochromatic wave, the motion being periodic. The oscillation period approaches infinity in the separatrix. The possibility of particle accumulation near singular points on the phase plane is pointed out which may lead to a resonant particle concentration in the respective radius. (6 refs.)

For oblique incidence and appropriate polarization, a coherent electromagnetic wave generates longitudinal Langmuir waves in an inhomogeneous plasma. These longitudinal waves propagate nonlinearly through the plasma even for rather low incident energy flux. This nonlinearity induces instabilities by coupling with two other Langmuir waves and an ion sound wave. For weak nonlinearity or strong damping, periodic time dependent solutions are found. They correspond to periodic emissions of soliton-like perturbations. For stronger nonlinearity, the solitons are emitted in a chaotic way. The consequence of this behaviour on the reflected electromagnetic wave and the plasma will be discussed. (4 refs.)

An instability of a relativistic electron beam in a plasma has been observed. This instability occurs in a time shorter than the scale time for changes in the magnetic field, $\tau_d = 4\pi\sigma^2/c^2$, and results in a displacement of the beam as a whole to the side wall of the drift chamber. (3 refs.)

76194 Plasmon spontaneous emission and entropy in Kaufman and Morrison's formalism for the quasilinear equations of plasma physics. R.J.-M.Grognard (Div. of Radiophys., CSIRO, Sydney, Australia).

Phys. Lett. A (Netherlands), vol.95A, no.8, p.432-5 (23 May 1983).

The Poisson bracket defined by Kaufman and Morrison (see *ibid.*, vol.88, p.405, 1982) to derive the standard quasilinear equations of plasma physics is slightly modified to account for the spontaneous emission of plasma waves. A more satisfying 'H theorem' results from this modification. (4 refs.)

76195 BIRTH: A beam deposition code for non-circular tokamak plasmas. M.Otsuka, M.Nagami, T.Matsuda.

Report JAERI-M-82-129, Japan Atomic Energy Res. Inst., Tokai, Ibaraki (Sept. 1982), 35 pp.

A new beam deposition code has been developed which is capable of calculating fast ion deposition profiles including the orbit correction. The code incorporates any injection geometry and a noncircular cross section plasma with a variable elongation and an outward shift of the magnetic flux surface. Typical c.p.u. time on a DEC-10 computer is 10-20 seconds and 5-10 seconds with and without the orbit correction, respectively. This is shorter by an order of magnitude than that of other codes, e.g. Monte Carlo codes. The power deposition profile calculated by this code is in good agreement with that calculated by a Monte Carlo code. (13 refs.)

76196 Parametric excitation of a drift wave and associated ion heating by a modulated ion beam. M.Yatsuzuka, K.Satoh, S.Nobuhara (Dept. of Electrical Engng., Himeji Inst. of Technol., Hyogo, Japan), K.Yatsui, M.Yokoyama.

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1609-17 (May 1983).

An ion beam modulated near the low-hybrid frequency is injected into a low- β plasma immersed in a longitudinal magnetic field. Parametric excitation of a drift wave and a lower-hybrid wave is observed. From the measurement of the threshold electric field, an RF field parallel to the magnetic field is found to play an important role in the excitation of the instability. Substantial increase of the ion and electron temperatures has been observed with the growth of the instability. Such a rapid heating may be principally due to the drift wave instability driven parametrically. (20 refs.)

76197 The classical theory of the bumpy torus relativistic annulus. S.Hamasaki, N.A.Krall, J.L.Sperling (JAYCOR, San Diego, CA, USA).

Nucl. Fusion (Austria), vol.23, no.5, p.571-96 (May 1983).

The relativistic electron annulus is a critical component of the bumpy torus magnetic fusion concept. An analysis of the annulus is presented in which the ring steady state is determined by the explicit balance of quasi-linear heating and classical losses, i.e. collisions and synchrotron radiation. Both anisotropy and loss-cone effects are included in the formalism. It is demonstrated that a large number of electron cyclotron harmonics, not just the first and second, contribute in an appreciable way to annulus steady state and power balance. Without a loss cone, the analysis reproduces the relativistic passing electron population observed in bumpy tori on confined drift surfaces near the centre

of the bumpy torus cross-section. Loss-cone effects permit an annulus population with large perpendicular pressure to exist. It is shown that the balance between quasi-linear heating and the classical losses cannot account for the experimental scaling of bumpy torus annulus temperature; therefore, processes not included in the classical ring power balance model must contribute in a non-trivial way to observed annulus properties. (18 refs.)

76198 A unified theory of a class of mode conversion problems. R.A.Cairns (Dept. of Appl. Maths., Univ. of St. Andrews, St. Andrews, Scotland), C.N.Lashmore-Davies.

Phys. Fluids (USA), vol.26, no.5, p.1268-74 (May 1983).

Many radio-frequency heating methods involve conversion of an incoming wave to another mode which only propagates within the plasma and is ultimately damped. A method previously used to consider electron cyclotron heating by the O mode is extended to other mode conversion phenomena. From the properties of the dispersion relation in the neighborhood of the mode conversion point, differential equations for the mode amplitudes are constructed, in a well-defined way, which give energy conservation in the absence of damping. An analytic solution gives the transmission and conversion coefficients in terms of parameters defining the local behavior of the dispersion relation. The technique is applied to a number of problems, showing that they can all be solved by elementary algebraic manipulations of the local dispersion relation. The phenomenon of electron cyclotron emission also falls rather naturally into this mode conversion picture. It is also suggested that the method of dealing with cyclotron emission may have some relevance to the more general problem of energy transport across a magnetic field. The technique, therefore, brings together into a unified theory a number of problems which have been treated by diverse, and usually more complicated, mathematical techniques in the existing literature. (16 refs.)

76199 Direct measurement of anisotropy of hot electron rings using synchrotron emission. S.Tamor (Sci. Appl. Inc., La Jolla, CA, USA).

Phys. Fluids (USA), vol.26, no.5, p.1335-7 (May 1983).

It is pointed out that velocity-space anisotropy of a relativistic electron ring is reflected in the angular distribution of the intensity and polarization of the synchrotron emission, and it is suggested that this effect may be useful for direct measurement of the anisotropy. Results of sample computations for a loss-cone type of distribution are presented. (7 refs.)

76200 Spectroscopic investigation of laser-initiated low-pressure plasmas in atmospheric gases. R.A.Armstrong (US Air Force Geophysics Lab., Hanscom Air Force Base, MA, USA), R.A.Lucht, W.T.Rawlins.

Appl. Opt. (USA), vol.22, no.10, p.1573-7 (15 May 1983).

Laser-initiated breakdown of N_2 , O_2 , and Ar has been investigated at sub-atmospheric pressures using a pulsed (10-nsec) Nd:yttrium aluminum garnet (Nd:YAG) laser at 1.06 μ m. Breakdown thresholds have been determined from 3 to 760 Torr, and spectral analysis of the plasma emission has been carried out at 10 and 125 Torr over the 300-600-nm range. Sharp spectral features arising from highly excited singly and multiply charged ions are reported as well as an underlying continuum at intermediate pressure. Time-resolved measurements indicate a complex kinetic dynamic optical behavior. (14 refs.)

76201 Steady-state laser deflagration sustained by a resonant laser beam, and possibilities for exciting laser deflagration waves. G.I.Kozlov, V.A.Kuznetsov (Inst. of Problems in Mech., Acad. of Sci., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.458-9 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1063-7 (Sept. 1982). [received: May 1983]

An intense laser deflagration has been observed for the first time in a resonant laser beam in carbon dioxide. The authors used a 1.5-kW CW CO_2 laser to produce and sustain steady-state laser deflagration. A vertical laser beam enters the cooled chamber through a salt-lens window. The chamber is filled with carbon dioxide. The laser beam is focused to a spot 0.5 mm in diameter at the exit of a nozzle. At atmospheric pressure they observe no significant emission near the spot, but as the gas pressure is raised to 5-10 atm, intense blue emission of a steady-state flame appears near the neck of the caustic. (no refs.)

76202 Self-focusing of laser beam crossing a laser plasma. J.S.Bakos, I.B.Foldes, P.N.Ignacz, Z.Sorlei.

Report KFKI-1983-12, Hungarian Acad. Sci., Budapest (1983), 10 pp.

A crossed beam experiment was performed to clarify the mechanism of self-focusing in a laser produced spark. The plasma was created by one beam and self-focusing was observed in the weak probe beam which crossed the plasma. Experimental results show that the cause of self-focusing is the nonuniform heating mechanism. (9 refs.)

76203 Cyclotron loss of fast particles from a bumpy Tokamak. S.V.Putinskii (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

JETP Lett. (USA), vol.36, no.9, p.397-400 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.326-8 (5 Nov. 1982). [received: June 1983]

A possible mechanism for the loss of fast particles from a Tokamak is examined: a cyclotron resonance of the particles with the bumpiness perturbations

of the toroidal magnetic field. The radial diffusion coefficient of the particles is estimated. (5 refs.)

76204 Sawteeth, magnetic disturbances, and magnetic flux regeneration in the reversed-field pinch. R.G.Watt, R.A.Nebel (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.5, p.1168-70 (May 1983).

A comparison of experimental data and theoretical results is presented that may help to explain the underlying causes of the flux regeneration mechanism ('dynamo') in the reversed-field pinch (RFP). Discrete events are seen on many diagnostic measurements which are coincident with observable increases in toroidal magnetic flux in discharges where the pinch parameter θ ($\theta \equiv B_{\theta\text{wall}}/(B_z)$) exceeds the value 1.6. By observing the relative timing and the θ dependence of these events as the discharge is returned to lower values of θ , a case may be made for associating the $m=1$ tearing mode with the RFP dynamo. (12 refs.)

76205 Radial guiding center drifts and omnigenity in bumpy torus confinement systems. R.D.Hazeltine, P.J.Catto (Plasma Res. Inst., Sci. Applications Inc., Boulder, CO, USA).

Phys. Fluids (USA), vol.26, no.5, p.1252-8 (May 1983).

Collisional transport of a high-temperature plasma across the confining field of a bumpy torus magnetic confinement system depends sensitively upon the functional form of the radial guiding center drift, and thus upon details of the confinement geometry. A general and relatively explicit formula for the radial drift is derived, using the large aspect ratio results of a previous equilibrium study. Allowance is made for (i) arbitrary toroidal variation of the confining field; (ii) field distortion due to plasma currents; (iii) noncircular deformation of the toroidal field coils. However, the analysis pertains only to the plasma core, and not to the high-beta annuli (electron rings) which are usually present in experiments. The question of bumpy torus omnigenity—whether any bumpy torus field configuration is consistent with a vanishing, or nearly vanishing, radial drift—is also investigated. It is found that omnigenity cannot occur, at least in the vicinity of the magnetic axis. (10 refs.)

76206 Evaluation of the structure of ergodic fields. A.H.Boozer (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

Phys. Fluids (USA), vol.26, no.5, p.1288-91 (May 1983).

A method of analyzing ergodic magnetic fields is given, including a generalization of magnetic coordinates to such fields. The results of this analysis can be used in existing Monte Carlo codes to assess the enhanced transport associated with imperfect surfaces. The Hamiltonian for a general magnetic field is given as part of this analysis. (12 refs.)

76207 Stable equilibria having arbitrary q profile. A.Reiman (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA), A.Boozer.

Phys. Fluids (USA), vol.26, no.5, p.1292-4 (May 1983).

It is shown that minimum energy equilibria can be constructed with any q (inverse rotational transform) profile such that $1/q$ is continuous. These equilibria are stable to both ideal magnetohydrodynamic (MHD) and tearing modes. In particular, explicit equilibria are presented which have a local minimum in q but are nevertheless stable. (11 refs.)

76208 Two-dimensional equilibria of field-reversed configurations in a perfectly conducting cylindrical shell. D.W.Hewett, R.L.Spencer (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.5, p.1299-304 (May 1983).

Two-dimensional field-reversed equilibria bounded by a conducting cylinder are computed. The computation is made possible by using a global constraint and by using a computational algorithm that is protective of the initial guess. A pressure profile is used that has sufficient generality to match experimentally produced configurations. It is found that for some choices of separatrix radius and separatrix beta, no equilibria exist. The reasons for loss of equilibrium are discussed and an example of a configuration near loss of equilibrium conditions is given. (14 refs.)

76209 Nonlinear, single-helicity magnetic reconnection in the reversed-field pinch. E.J.Caramana, R.A.Nebel, D.D.Schnack (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.5, p.1305-19 (May 1983).

A computational and analytical study of the nonlinear evolution of single-helicity, resistive, current-driven modes in the reversed-field pinch utilizing the single-fluid magnetohydrodynamic approximation is presented. In the start-up phase it is found that an off-axis current peak can be anomalously dissipated by globally reconnecting current-driven modes. The reconnection is seen to be well described by the Kadomtsev reconnection model, which is directly applied to the reversed-field-pinch regime. During the sustainment phase of the discharge, stable profiles are driven unstable by transport processes and destabilized by the resulting current-driven instabilities. The dynamics of the toroidal field is of fundamental importance in the evolution of these modes. The reversed-field-pinch profile is restabilized by two successive global reconstructions: the first removes the rational surface; the second restores it. It is also found that magnetic reconnection can occur in the reversed-field pinch without a linear phase. Although the interaction of instabilities with different helicities is not directly investigated, the importance of this phenomenon in the reversed-field pinch is discussed. (49 refs.)

76210 Rotational instabilities in the field-reversed configuration: results of hybrid simulations. D.S.Harned (Coll. of Engng., Univ. of California, Berkeley, CA, USA).

Phys. Fluids (USA), vol.26, no.5, p.1320-6 (May 1983).

Rotational instabilities in rigidly rotating field-reversed configuration (FRC) equilibria are studied using a quasineutral hybrid simulation code. The authors observe unstable $m=2$ modes at levels of ion rotation below instability thresholds predicted by finite-Larmor-radius fluid theory. Nonlinear effects are found to reduce the growth rate and lower the real frequency of the $m=2$ mode at large amplitude. Instabilities with $m>2$ have been observed for strongly reversed cases. It is also found that growth rates for these instabilities can be reduced by increasing the ratio of the plasma radius to the ion Larmor radius. (20 refs.)

76211 A numerical analysis of flute modes in the ELMO Bumpy Torus. A.M.El Nadi, J.C.Whitson (Fusion Energy Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Phys. Fluids (USA), vol.26, no.5, p.1327-9 (May 1983).

Allowing for realistic magnetic field and plasma density profiles, a radial eigenvalue computer code was used to investigate flute modes in the ELMO Bumpy Torus (EBT). (8 refs.)

76212 Steady-state radial heat conduction in a Z pinch. D.W.Schudder (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Phys. Fluids (USA), vol.26, no.5, p.1330-4 (May 1983).

One-dimensional steady-state radial profiles of a classical Z pinch are calculated. The effects of ion thermal conduction and bremsstrahlung radiation losses are induced self-consistently, as are Ohmic heating, pressure balance, and an equation of state. It is shown that the upper current limit of approxi-

mately 1.4 MA for an equilibrium pinch found when only bremsstrahlung losses are allowed is virtually unaffected by the inclusion of ion thermal conduction. However, solutions with lower currents are now allowed. The profile-smoothing effect of ion thermal conduction is not sufficient to produce a pressure profile stable to $m=0$ modes. Total losses due to radial conduction are shown to be small for a thermonuclear plasma. (17 refs.)

76213 Slowing down of ion rings. C.B.Ruchti, R.V.Lovell (Dept. of Appl. Phys., Cornell Univ., Ithaca, NY, USA). *Phys. Fluids (USA)*, vol.26, no.5, p.1341-8 (May 1983).

A study is made of the slowing down of self-consistent, large-orbit ion rings due to small-angle Coulomb scattering in a dense, low-temperature plasma. A kinetic equation is derived for the ion-ring distribution function $f(P, I, t)$, where P is the canonical angular momentum, and I is an adiabatic invariant which is an implicit function of P and the particle energy. The ratio of the time scale for the perpendicular momentum change (diffusion) to that for the parallel momentum change (drag) is m/M , with M the ion mass and m the electron mass. Therefore, drag is the dominant collisional effect, and the slowing down corresponds to incompressible flow in the (P, I) plane. This flow is calculated numerically by computing sequences of equilibria. Initially well-trapped distribution functions are found to have essentially no particle loss during the first slowing-down time τ , which is defined as the time it would take a single ring particle to slow down to zero energy. In most of the cases studied, the rings shrink in both radius and in axial length, with the field reversal increasing by $\approx 10\%$ within one τ . The rate of loss of toroidal kinetic energy exceeds the loss of poloidal energy by a factor of typically 1.5-2.0. The self-consistent toroidal electric field opposes the slowing down, increasing the ring lifetime by 20%-50% over the single-particle slowing-down time. (16 refs.)

76214 Operation of the tandem-mirror plasma experiment with skew neutral-beam injection. T.C.Simonen, S.L.Allen, T.A.Casper, J.F.Clauser, C.A.Clover, F.H.Coensgen, D.L.Cornell, W.F.Cummins, C.C.Damm, M.Flammer, J.H.Foote, R.K.Goodman, D.P.Grubbs, E.B.Hooper, R.S.Hornady, A.L.Hunt, R.G.Kerr, A.W.Molvik, R.H.Munger, W.E.Nexsen, T.J.Orzechowski, W.L.Pickles, P.Poulsen, M.E.Rensink, B.W.Stallard, W.C.Turner, W.L.Hsu, W.Bauer (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), T.L.Yu, D.Zimmermann. *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1668-71 (23 May 1983).

Tandem-mirror plasma with sloshing-ion end plugs has been produced. Ion-velocity distribution functions are peaked at 47° to the magnetic field lines. Low-level ion-cyclotron fluctuations were detected at 1.8 times the plug-midplane frequency and with properties predicted by theory; they did not degrade plasma confinement in the plugs or central cell. (21 refs.)

76215 Relaxation calculation of the electrostatic properties of compensated Penning traps with hyperbolic electrodes. G.Gabrielse (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2277-90 (May 1983). Spectacular accuracies have been achieved with single elementary particles trapped in hyperbolic Penning traps, but only after anharmonicities have been tuned out of these traps by varying the potential of extra compensation electrodes introduced into the traps. The relaxation calculation reported is the first theoretical study of the electrostatic properties of such compensated Penning traps. Enough computations have been completed to clarify the basic physics involved in anharmonicity compensation and to provide useful, quantitative information for experiments in progress (especially for testing of anharmonicity systematics). The clearer picture of anharmonicity compensation which emerges suggests that the design of existing Penning traps could be significantly improved. An optimal electrode configuration is proposed which, in principle, makes the harmonic oscillation frequency of a trapped particle independent of changes in the compensation potential. (17 refs.)

76216 Wire X pinch in a high-current diode. S.M.Zakharov, G.V.Ivanenkov, A.A.Kolomenskii, S.A.Pikuz, A.I.Samokhin, I.U.Shmid (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.456-7 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1060-3 (Sept. 1982). [received: May 1983]

In the present experiments, wire X pinches were produced in the diode of the Don high-current accelerator with a forming line having parameters of 400 kV, 1.5 kJ, and 30 ns. The dynamics of the pinch were studied by five-frame high-speed interference and shadow photography in the beam from a ruby laser. The time interval between frames was 10 ns, and the exposure time was 3 ns. (2 refs.)

76217 Application of the method of resonance fluorescence for diagnostics of a high-temperature plasma. V.S.Burakov, G.T.Razdobarin (Phys. Inst., Acad. of Sci., Belorussian SSR).

Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.5, p.121-7 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.957-63 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).

The authors interpret the results obtained in the joint investigations performed by the Leningrad and Belorussian physicists which were directed at developing the method of resonance fluorescence for the diagnostics of high-temperature plasma. (46 refs.)

76218 Measurement of ionisation rate coefficients of nitrogen ions. R.Brown, W.M.Deuchars, D.E.Kidd, H.P.Summers, L.Wood (Dept. of Natural Philosophy, Univ. of Strathclyde, Glasgow, Scotland). *J. Phys. B (GB)*, vol.16, no.11, p.2053-62 (14 June 1983).

Time histories of the emission of a number of spectrum lines of the ions N^{+} to N^{3+} have been measured in a theta-pinch discharge of maximum axial electron temperature 100 eV and electron density $8 \times 10^{15} \text{ cm}^{-3}$. The lines observed in the discharge are subordinate lines in the quartz UV region and the observations were made both end on and side on to the discharge axis. Ionisation rate coefficients have been inferred from comparison with a theoretical model of the transient ionisation. The rates are conveniently expressed as scaling factors of an empirical ionisation rate expression due to Kunze (1971). These factors are 1.5 and 0.55 for N^{3+} and N^{4+} and the electron temperatures at the times of maximum abundance of these ions are 32 eV and 68 eV respectively. The result N^{4+} agrees well with the measurements of Kunze. (21 refs.)

76219 Photon-echo studies of collisional relaxation in weakly ionized noble-gas mixtures. M.R.Woodworth (Dept. of Phys., Univ. of Chicago, Chicago, IL, USA).

Opt. Lett. (USA), vol.8, no.6, p.307-9 (June 1983). Photon-echo relaxation rates are measured in weakly ionized plasmas of binary mixtures of noble gases in which the photon echo generated on a transition in one noble-gas species is damped primarily by atoms of the second species. The special cases of pure krypton and xenon are extensions of previous work in pure helium, neon, and argon. With the exception of mixtures with helium as the perturber, measured relaxation rates are consistent with collisional line-broadening calculations. (12 refs.)

76220 Tonks-Dattner diagnostics of electron density profiles. M.Mentzoni (Inst. of Phys., Univ. of Oslo, Oslo, Norway). *Phys. Scr. (Sweden)*, vol.27, no.4, p.311-13 (April 1983).

The uniqueness of Tonks-Dattner-diagnostics for determining the spatial electron density profile, $N_e(R)$, across a plasma column has been investigated. By choosing $N_e(R)$ either parabolic or linear it was found that the solutions yielded approximately overlapping profiles in the R -region for which the resonances occur. The whole profile enters into the equation for the average electron density, a quantity which is measured by microwave cavity techniques. The two profiles yielded thermal electron velocities which differed by about 15%. (8 refs.)

76223 Density of uranium ions in the $4f_{7/2}^0$ ground state in a hollow-cathode type discharge. P.Pianarosa, P.Bouchard, J.P.Saint-Dizier, J.M.Gagne (Dept. de Genie Phys., Ecole Polytech., Montreal, Quebec, Canada).

Appl. Opt. (USA), vol.22, no.10, p.1568-72 (15 May 1983).

A hollow-cathode type discharge cell as generator of uranium ions is investigated. The $4f_{7/2}^0$ ground-state ion density has been obtained by absorption spectroscopy of 5493 and 4244 Å. The absorption measurements have been performed using two identical hollow-cathode lamps: one acting as a light source, the other as a reservoir of free ions. Neon and xenon have been used as discharge sustaining gases. In the author's experimental conditions the measured ion ground-state density is of the order of 10^{12} ions cm^{-3} . Absorption measurements performed at 5915 and 4246 Å of U I give a density of the order of 10^{12} atoms cm^{-3} . This latter value is in excellent agreement with a previously measured value obtained by laser-absorption spectroscopy. (18 refs.)

76224 Thermal behavior of a solid particle in an arc discharge during transient cooling conditions. P.Meubus, M.Elayoubi (Centre de Recherche du Moyen Nord, Univ. du Quebec a Chicoutimi, Chicoutimi, Quebec, Canada). *Can. J. Phys. (Canada)*, vol.61, no.5, p.683-90 (May 1983).

The thermal behavior of a tungsten particle has been studied in an argon arc discharge during transient extinction conditions. At the beginning of the transient process, the particle is electrically neutral and is at the cathode voltage. During this period of time, it is observed that the thermionic cooling effect plays a major role in the heat transfer mechanisms. Within the limits of the solid surface and surrounding gas temperatures investigated, which varied between 3600 and 3300K for the surface and between 8000 and 6000K for the argon gas, the heat transfer rates by convection and radiation are of the same magnitude but opposite in sign. Each of them amounts to less than 10% of the heat loss rate induced by thermionic emission. Besides the theoretical aspect of the study, the cooling effect observed (about $6 \times 10^4 \text{ K s}^{-1}$) may be of interest for improving solid surface properties, provided that the solid particle possesses characteristic thermionic emission properties. (19 refs.)

Compares the influence of some factors on partial discharges in solid dielectrics with voids by high AC and DC voltages, such as permittivity, conductivity, time, applied voltage, temperature and space charge. (4 refs.)

76226 One particular aspect of the influence of the support electrode material upon the intensity of the lines in a spark discharge. V.D.Kurochkin. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.872-6 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.200-5 (Aug. 1982). [received: April 1983]

Electron levels are excited in collisions with fast electrons of the tail of the distribution function. The author determined experimentally the importance of the atoms of the support electrode in collision processes of this type, which occur in the plasma of a capacitor-supplied spark discharge. The investigations were made on W, Ta, Hf, Zr, Ir, Pt, Al, Cu, Zn, Mg, and Ag electrodes the active portions of which were cylinders with a diameter of 2 mm and a length of 5 mm. These metals are distinguished by both their thermophysical characteristics and their ability to oxidize. (10 refs.)

76227 Models for the development of the discharge in a Tokamak. Yu.N.Dnestrovskij, G.V.Pereverzev (I.V. Kurchatov Atomic Energy Inst., Moscow, USSR).

Nucl. Fusion (Austria), vol.23, no.5, p.633-48 (May 1983).

Numerical models for the development of the discharge in a Tokamak are considered. A hybrid model which describes the diffusion and convective processes and also the impurity radiation is used as the basis for a detailed study of the filling-gas ionization stage, the formation of the hot plasma column during the period of total current rise and the energy balance in the quasi-steady-state stage of the discharge. The model shows reasonable agreement with experiment at all stages of the discharge in a Tokamak. (29 refs.)

76228 Optogalvanic studies of neon glow discharge in magnetic fields: ion mobility measurements and detection of atomic alignment. L.R.Pendrill, M.Pettersson, U.Osterberg (Dept. of Phys., Chalmers Tekniska Hogskola, Goteborg, Sweden).

Phys. Scr. (Sweden), vol.27, no.4, p.306-10 (April 1983).

Studies have been made of optogalvanic signals when a glow discharge of neon, irradiated with light from a highly monochromatic dye laser, is subject to externally applied magnetic fields. The slow response of the discharge to an abrupt change in laser intensity is affected by varying magnetic field and discharge voltage in a way to suggest that positive Ne ions play an important role in the production of optogalvanic signals. A novel sub-Doppler spectral profile is observed, and an interpretation based on a discussion of the time-dependence of the optogalvanic signal as a sensitivity monitor of ionic velocities is presented. This effect is also a function of the atomic alignment. (18 refs.)

76229 Stratification of a glow discharge in a gas stream at enhanced power inputs. A.A.Besshaposhnikov, V.I.Blokhin, V.B.Voronin, S.V.Dvurechenskii, V.A.Mysin, S.V.Pashkin, N.A.Sokolov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.633-5 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1371-4 (Aug. 1982). [received: May 1983]

The authors have discovered a mechanism of excitation of striations that is connected with the nonstationary process of accumulation of chemically active particles (radicals and metastable molecules) in a gas-discharge plasma. (14 refs.)

76230 Movement of an arc spot in a magnetic field. S.A.Yukhimchuk, O.M.Sviderskaya (V.Ya. Chubar' Mech. Engng. Inst., Zaporozh'e, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1393-6 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2270-5 (Nov. 1982). [received: May 1983]

A device is described for studying arc spot motion in magnetic field. Experimental curves are reported for the average velocity, and the results are analyzed statistically and presented as histograms which reveal a nearly Gaussian distribution. The factors responsible for irregular arc spot jumping and the effects this has on electrode erosion are discussed. (7 refs.)

76231 Influence of plasma composition in a low-inductance vacuum spark on the parameters of a micropinch region. Yu.V.Sidel'nikov (Inst. of Spectroscopy, Acad. of Sci., USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1402-3 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2283-4 (Nov. 1982). [received: May 1983]

The anodes in the author's low-inductance vacuum spark setup ($V_0=16 \text{ kV}$, $C_0=10 \text{ μF}$, $I_m=200 \text{ kA}$) consisted of pure titanium or of the alloys 50% Ti+50% Mo, Nb, or 80% Ti+20% Mo, Nb. The plasma parameters in the micropinch regions were found from resonance line spectra of helium-like ions and their satellites. The X-ray spectra were recorded using a focusing quartz spectrograph ($2d=6.67 \text{ Å}$) with spectral resolution $7 \times 10^{-4} \text{ Å}$. The author recorded Ti XX-XXI spectra for different plasma compositions under identical exposure conditions (100 discharges were used for each spectrum). The findings indicate that the electron temperature and plasma density in a low-inductance vacuum spark micropinch can both be increased by adding heavy elements. (9 refs.)

60.00 CONDENSED MATTER: STRUCTURE, THERMAL AND MECHANICAL PROPERTIES

61.00 STRUCTURE OF LIQUIDS AND SOLIDS; CRYSTALLOGRAPHY

(see also 68.20 Solid surface structure, 71. Electron states)

76232 Anisotropic scaling of three-dimensional intensity data. Z.Shakked (Dept. of Structural Chem., Weizmann Inst. of Sci., Rehovot, Israel).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.278-9 (1 May 1983).

Three-dimensional diffractometer data collected from single crystals of large and anisotropic mosaic spread were shown to suffer from severe systematic errors. The application of anisotropic scaling of the structure factors in the refinement process proved to be very useful in correcting these errors, yielding more accurate parameters, comparable to those obtained from high-quality crystals. (7 refs.)

76233 A technique for the calculation of multislice transmission functions for crystals with large (or infinite) repeat distances in the beam direction. A.R.Wilson (Electron Microscope Unit, Univ. of Sydney, Sydney, NSW, Australia).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.282-6 (1 May 1983).

A partially analytic technique for the calculation of electron transmission functions used in multislice calculations is developed. This development utilizes the fact that atomic scattering amplitudes are generally available as fitting parameters to four Gaussians. The result is especially applicable to calculations with a large or infinite repeat distance in the incident-beam direction and initial test calculations give a time saving of a factor of four. Sample results are given for the calculation of images from an inclined stacking fault in gold. (11 refs.)

76234 Secondary extinction factor for spherical crystals. T.Kawamura, N.Kato (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.305-10 (1 May 1983).

The extinction factor η was numerically calculated for spherical crystals based on the new statistical dynamical theory [Kato (1976)]. The optical paths in the Bragg case and other geometrical cases such as the Laue-Bragg-Laue are properly treated, so that the accuracy is estimated to be 0.1% for $\mu_0 R \leq 3.0$, $\sigma R \leq 2.0$ and $\theta_B \leq 30^\circ$ (μ_0 absorption coefficient, σ is the coupling constant of the energy transfer equations, θ_B the Bragg angle). Based on these calculations a universal fitting function $\eta(\mu_0 R, \sigma R, \theta_B)$ is proposed in the above-mentioned domains. The accuracy is better than 0.4% if η is larger than 10%. The difference between the present and the conventional theories is significant if the extinction exceeds 20%. (9 refs.)

76235 Absorption and secondary extinction. F.R.Thornley (Dept. of Appl. Phys., Univ. of Strathclyde, Glasgow, Scotland).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.326-32 (1 May 1983).

A comparison is made of the treatment of absorption in the theories of secondary extinction by Werner (1974) and by Becker & Coppens (1974). The Werner approach treats absorption and extinction together, whereas Becker & Coppens assume a prior correction for absorption, and make an approximate allowance for the effect of absorption on the extinction by modifying the parameter representing the effective crystal dimension. By consideration of the form of the corrections for a specially simple crystal shape, it is shown that the Becker & Coppens method predicts slightly greater extinction than does the unified treatment of Werner. However, the difference is small, and likely to be unimportant in practice. The Werner solution of the Hamilton-Zachariasen transfer equations is exact, but not easy to use. The Becker & Coppens results are approximate, but they are presented in a form convenient for computation. (12 refs.)

76236 Crystallographic applications of the elementary divisor theorem. M.A.Fortes (Dept. de Metalurgia, Univ. Tecnica de Lisboa, Lisboa, Portugal).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.348-50 (1 May 1983).

A crystallographic interpretation of the elementary divisor theorem applied to square integral matrices is presented. The concept of a least multiplier of a

rational square matrix is introduced and its properties are derived from the theorem. These topics are relevant in the formulation of a general theory of coincidence-site lattices. (3 refs.)

76237 A test of a robust/resistant refinement procedure on synthetic data sets. E.Prince (Nat. Measurement Lab., NBS, Washington, DC, USA), W.L.Nicholson.

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.407-10 (1 May 1983). The conventional crystallographic least-squares procedure has been compared with a robust/resistant modification in which the weight of each reflection is multiplied by a function of the ratio of its residual to a resistant measure of the width of the residual distribution on the previous cycle. Three synthetic data sets were created by adding random errors, according to various probability distributions, to the calculated structure factors for a known crystal structure. A set with a Gaussian error distribution was refined with two sets of weights: one assigned correctly in proportion to the reciprocals of the variances of the data points, the other using unit weights throughout. The second error distribution was Gaussian contaminated by 10% drawn from another Gaussian distribution with its variance nine times greater. The third distribution was a long-tailed distribution derived by dividing a random variable with a Gaussian distribution by an independent random variable with a uniform distribution. Each of the first three cases was refined to convergence using both conventional and robust/resistant procedures, with the modified procedure leading to a result at least as close to the known structure as the conventional procedure. In the fourth case, the conventional procedure gave a poor fit, but the robust/resistant procedure converged to a reasonable approximation to the correct structure. (9 refs.)

76238 A simple method to cut a single crystal in any desired direction. C.Campos, L.P.Cardoso, S.Caticha-Ellis (Crystallographic Lab., Inst. de Física, UNICAMP, Sao Paulo, Brazil).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.360 (1 June 1983). A simple and efficient method to cut a single crystal of any shape along any desired crystallographic direction with a disk diamond saw without angular adjustments has been developed. The basic idea of the method is to align the crystal accurately and to transfer it to a saw without the goniometer head whose grip would not stand the cutting pressure of the saw. As in this method of alignment the crystal can be rotated through 360° around the normal to the reflecting plane and independently around the ω axis, it is easy to align it to be cut along any prescribed non-crystallographic direction. (2 refs.)

61.10 X-RAY DETERMINATION OF STRUCTURES

(see also 61.80 Radiation damage and other irradiation effects; for specific determinations, see 61.55 to 61.80)

76239 Patterson derivation of structure invariants: a numerical test. S.Bruckner, G.Allegre (Dipartimento di Chimica, Politecnico di Milano, Milano, Italy).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.273-7 (1 May 1983). A numerical test is carried out on the theory proposed by one of the authors [Allegre (1979)], which derives three-phase invariants from the Patterson function. The method is checked with two structures already solved (P1 space group). For the strong Sayre triples the calculated cosine invariants are generally positive; the negative invariants arise from relatively minor features of the Patterson background, and so are more difficult to obtain. With a suitable choice both of the error standard deviation and of the degree of sharpening of the Patterson function, the average value of the calculated cosine invariants within small subsets of Sayre triples is reasonably close to +1, while that of the negative invariants is either smaller and positive or slight negative. The agreement between the test calculations and the results obtained after structural refinement is much improved if the calculated amplitudes and an extended limiting sphere are used instead of the experimental data. (12 refs.)

61.10D Theories of diffraction and scattering

76240 Dynamical X-ray propagation: a theoretical approach to the creation of new wave fields. F.Balibar (Lab. de Mineralogie-Cristallographie, Univ. Pierre et Marie Curie, Paris, France), F.N.Chukhovskii, C.Malgrange.

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.387-99 (1 May 1983). Although it is commonly invoked, the phenomenon of 'creation of new wave fields', which is responsible for some of the features visible on topographic images, has never been really explained in theoretical terms. This is done here in the case of a crystal deformed by a uniform strain gradient. The appropriate Green function is expanded in reciprocal space as a wave packet of non-plane waves, each component corresponding to a single value of the deviation parameter at the entrance surface. It is then shown that each component of this wave packet is made up of four parts, two of which can be identified as 'normal' wave fields (i.e. those predicted by the Eikonal theory); the two others are the so-called 'created wave fields'; it is shown that they correspond to interbranch scattering from one branch of the dispersion surface to the other and give rise to two extra beams. These created wave fields extract a fraction $e^{-2\pi|\nu|}$ out of the normal energy flow ($|\nu|$ being inversely proportional to the strain gradient), in full agreement with previous computer experiments. (21 refs.)

76241 On the X-ray-reflectivity of elastically bent perfect crystals. Z.H.Kalman (Racah Inst. of Phys., Hebrew Univ., Jerusalem, Israel), S.Weissmann.

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.295-303 (1 June 1983). The integrated X-ray reflectivity of elastically bent, but otherwise perfect, crystals are calculated for Laue-type reflections covering the entire curvature range. Anomalous transmission and elastic anisotropy are taken into account, and it is shown that both these effects affect appreciably the reflected intensities for both weakly and strongly bent crystals. The validity of the reflectivity vs. curvature relation thus obtained is experimentally confirmed for a number of reflections from silicon crystals. The implications of the experimental results to brittle fracture are discussed. (13 refs.)

76242 Determination of lattice parameters of non-cubic systems from pairs of X-ray diffraction lines. Guo Changlin, Ma Litai (Shanghai Inst. of Ceramics, Acad. Sinica, Shanghai, China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.3, p.346-51 (March 1983). To calculate the lattice parameters by measuring the difference of angles δ_{ij} between two diffraction lines of polycrystalline materials has many advantages. Comparatively speaking, it is rather simple and convenient technically to measure the difference of angles or the relative distance between two diffraction lines. Moreover, the precision requirement is not high for the X-ray apparatus and the measuring device. So it is easy to obtain accurate results. Popovic (1971) and Halliwell (1972) suggested a method for precise

determination of lattice parameters from pairs of X-ray diffraction lines. But it is applicable only to the simplest cubic system. In this paper, the equations of the pair-method applicable to all crystal systems regardless of their complexity have been derived. A procedure for measuring lattice parameters by processing is also provided. In addition, some practical examples are given. (6 refs.)

76243 Analysis of the inclination method for the investigation of Pendellosing interference of neutrons and X-rays. N.E.Belova (Inst. fur Atomenergie 'I.V. Kurchatov', Moscow, USSR), F.Eichhorn, V.A.Somenkov, K.Utemisov, S.Sh.Shilshtein.

Phys. Status Solidi a (Germany), vol.76, no.1, p.257-65 (16 March 1983). In German.

Pendellosing interferences in a wide range of crystal thicknesses and extinction lengths can be measured by the inclination method. The positions of the extrema of intensity coincide well with the calculated ones but the observed contrast of the oscillations is considerably weaker than the theoretical one. A mathematical model is given, taking into account the influence of several factors which characterize as well the incident radiation as the crystal examined. From this follows, that the inclination method is insensitive to many disturbing factors, and therefore it can be used for metrological purposes. (10 refs.)

76244 On the theory of X-ray diffraction in a perfect crystal with distorted surface layer. Yu.N.Belyaev, A.V.Kolpakov (Dept. of Phys., Moscow State Univ., Moscow, USSR).

Phys. Status Solidi a (Germany), vol.76, no.2, p.641-6 (16 April 1983). X-ray diffraction in a perfect crystal with distorted surface layer is considered on the basis of the recurrence relations for amplitude reflection and transmission coefficients of X-rays in a multilayer crystal. It is shown that such parameters of a distorted layer as its thickness and change in the interplanar spacing can be determined directly from diffraction curves of different orders. (15 refs.)

76245 X-ray diffraction by mixed-layer structures with a random distribution of stacking faults. B.A.Sakharov, A.S.Naumov, V.A.Drits (Geological Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.523-5 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.339-43 (July 1982). [received: April 1983]

The authors generalize the mathematical formalism for the general case of diffraction from model layered systems which contain, at the same time, both layers of different types and different types of stacking faults, whose distribution in the bulk of the crystal can be characterized by a different degree of order-disorder and is described by a particular choice of probability factors. (8 refs.)

76246 Intensity of X-rays scattered by layered structures with short-range order factors $S \geq 1$, $G \geq 1$. B.A.Sakharov, A.S.Naumov, V.A.Drits (Geology Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.583-4 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.871-4 (Aug. 1982). [received: May 1983]

The goal of the work reported by the authors was to generalize the matrix method of calculating the intensity of X-ray scattering for layered structures containing at the same time layers of different types and stacking faults whose distribution in the bulk of the crystal is specified with the aid of arbitrary values of S and G. (4 refs.)

61.10F Experimental techniques

(inc. apparatus, techniques and calculation methods for analyzing experimental results; see also 07.85 X-ray, gamma-ray instruments and techniques)

76247 Recovery of concentration spectra of binary solids from diffraction profiles by means of band matrices. P.Schattschneider, A.Wagendristel (Inst. für Angewandte und Tech. Phys., Tech. Univ. Vienna, Vienna, Austria).

Appl. Phys. A (Germany), vol.A31, no.2, p.81-6 (June 1983). A method for the retrieval of concentration spectra of crystalline mixtures from X-ray diffraction profiles is described. Both spectra are associated with an integral equation which can be simplified to yield a set of linear equations. Solutions are readily obtained by triangular decomposition since the equations are typically described by band matrices. The method has been tested with simulated diffraction profiles to allow for a variety of options concerning the concentration spectra. The procedure is well suited for binary alloys containing crystals of different structure and lattice parameters. The time consumption of the calculations is significantly reduced as compared to hitherto available methods. (16 refs.)

76248 The short-range structure of Ti and Zr BCC solid solutions containing the ω phase. III. Extension of the diffraction theory to partially transformed systems. B.Borie, H.L.Yakel (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.287-97 (1 May 1983). A refinement of earlier models used to compute intensity distributions for the diffuse ω phase is described. The model includes both faulted ω regions and untransformed BCC regions. The diffuse intensity generated by this model is compared with experiment. A result of this calculation is that, unlike its predecessors, it causes the observed diffuse maxima under the sharp fundamental Bragg reflections. The model is shown to be compatible with measurements of the integrated intensities of the fundamental reflections. A correction to the single-variant intensity calculation to account for interference effects among the variants is displayed. The result is compared with those of other structural models for the diffuse ω phase, and the implications of its details are discussed. (11 refs.)

76249 Strengthened translation functions. An automated method for the positioning of a correctly oriented fragment by translation functions in DIRDIF Fourier space. H.M.Doesburg, P.T.Beurskens (Crystallography Lab., Univ. of Nijmegen, Nijmegen, Netherlands).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.368-76 (1 May 1983). Translation functions are used to determine the position of a correctly oriented molecular fragment. Usually, translation functions are defined for the Patterson space. A new translation function is presented, which is defined as a convolution in electron-density space, and expressed as a Fourier synthesis. After expansion of the reflection data to space group P1, coefficients for the synthesis are obtained by direct methods on difference structure factors (the DIRDIF procedures). From the position of the maximum in the translation function, the position of the known fragment relative to symmetry elements can be obtained. The new translation function provides a fast and reliable method for the positioning of a correctly oriented fragment, if the fragment constitutes at least about 10% of the total scattering power of the primitive unit cell. The procedure has been automated in the computer program

TRADIR. Examples of applications on known and unknown structures are given. (38 refs.)

76250 Generalized relations between *d*-orbital occupancies of transition-metal atoms and electron-density multipole population parameters from X-ray diffraction data. A.Holladay, P.Leung, P.Coppens (Dept. of Chem., State Univ. of New York, Buffalo, NY, USA).

Acta Crystallogr. Sect. A (Denmark), vol.16, pt.3, p.377-87 (1 May 1983). Generalized relations relating multipole population parameters to *d*-orbital occupancies of transition-metal atoms are presented. The relations are cast in the form of a 15×15 matrix which reduces to smaller size for site symmetries higher than 1. The matrix takes into account differences in normalization of density functions and atomic orbitals. The expressions are applied to diffraction data on $\text{Cr}(\text{CO})_6$, $\text{Mn}_2(\text{CO})_{10}$, $\text{Co}_2(\text{CO})_8$, $\text{Co}_3(\text{CO})_9\text{CH}_3$, $\text{Co}(\text{NH}_3)_6\text{Cr}(\text{CN})_6$ and $\text{Co}(\text{NH}_3)_6\text{Co}(\text{CN})_6$. In all cases crystal-field destabilized orbitals are depopulated relative to stabilized orbitals. Results are in almost quantitative agreement with theoretical populations; small remaining discrepancies are to be analyzed further for their possible significance. (29 refs.)

76251 Certification of Si powder diffraction standard reference material 640a. C.R.Hubbard (Center for Materials Sci., NBS, Washington, DC, USA).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.285-8 (1 June 1983). A new lot of high-purity silicon powder with mean crystallite size of about 6 μm has been certified as Standard Reference Material 640a. This SRM can be used as both an external and an internal 2θ calibration standard. The lattice parameter, uncorrected for refraction, is $a = 5.430825(11)$ for $\lambda(\text{Cu K}\alpha_1) = 1.5405981 \text{ \AA}$ at 298.1K. (13 refs.)

76252 Rational functions as profile models in powder diffraction. N.P.Pyrros (JCPDS-Internat. Center for Diffraction Data, NBS, Washington, DC, USA), C.R.Hubbard.

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.289-94 (1 June 1983). Rational functions, the ratio of two polynomials, are shown to be good approximations to powder diffraction profiles. These functions are generalizations of the Lorentzian, the modified Lorentzian, and the profile model of Parrish (Parrish, Huang and Ayers (1976). *Trans. Am. Crystallogr. Assoc.* 12, 55-73). The simplest of these functions is of the form $f(x) = 1/(1 + A_1x^2 + A_2x^4)$ with constants A_1 and A_2 that describe the shape of the peak, $x = 2\theta - 2\theta_0$, and $2\theta_0$ the position of the peak maximum. This function approximates very well Pearson VII distributions with exponents between 1 and 3. An asymmetric profile model with different A_1 , A_2 parameters for the two halves of the peaks was fitted to silicon X-ray powder diffraction profiles and gave unweighted agreement factors from $R_2 = 0.02$ to 0.04 for peaks varying from 28 to $137^\circ 2\theta$. (12 refs.)

76253 On-line Fourier analysis of the shapes of X-ray diffraction peaks. W.H.Schlossberg (Bendix Corp., Kansas City, MO, USA), J.B.Cohen.

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.304-8 (1 June 1983). A technique for on-line data collection and Fourier analysis of diffraction profiles is described to obtain information on particle size and microstrain from multiple orders of a reflection or from a single peak. Equations are given for errors in these quantities due to counting statistics. Their use in determining these parameters to operator-specified limits reduces the usual time required for data collection. (15 refs.)

76254 The determination of crystallite-size and lattice-strain parameters in conjunction with the profile-refinement method for the determination of crystal structures. Th.H.De Keijser, E.J.Mitteemeijer, H.C.F.Rozendaal (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.309-16 (1 June 1983). It is shown that the current status of the least-squares profile-refinement method, for the determination of crystal structures from X-ray and neutron powder diagrams, allows the simultaneous determination of crystallite-size and lattice-strain parameters. As profile-shape functions the Voigt, pseudo-Voigt and Pearson VII functions are considered. Formulae are obtained enabling structure refinement and size-strain analysis in the same computer run. (35 refs.)

76255 Residual stresses in cubic materials with orthorhombic or monoclinic specimen symmetry: influence of texture on ψ splitting and non-linear behaviour. C.M.Brakman (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.325-40 (1 June 1983). A quantitative formulation is given of the X-ray diffraction determination of (elastic) lattice deformation in a direction determined by two angles ψ and ϕ with respect to the specimen frame: the so-called $\sin^2\psi$ method giving full credit now to crystallographic texture. In most cases of practical X-ray stress analysis (residual) stresses are evaluated by the traditional $\sin^2\psi$ method using quasi-isotropic X-ray elastic constants depending on the lattice plane $\{hkl\}$ chosen for the measurement but not on the directions ϕ and ψ . For the case of a textured specimen, however, the single-crystal elastic tensor components should be coupled to the orientation distribution function (ODF). At variance with most papers published on this subject, which describe the texture using ideal texture components, a general method is developed making full use of relevant ODF theory. It is demonstrated that for orthorhombic specimen symmetry no ψ splitting occurs in contrast with the case of monoclinic specimen symmetry. The theory developed is used to explain some experimental results published previously. All calculations use Reuss's theory of elasticity which neglects the mutual coupling of the crystallites. (46 refs.)

76256 A novel curved position-sensitive proportional counter for X-ray diffractometry. E.R.Wolfel (STOE Appl. Lab., Darmstadt, Germany).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.341-8 (1 June 1983). A novel position-sensitive detector (PSD) is described which has been used on the STOE focusing monochromatic-beam diffractometer. The anode wire of the PSD coincides with the focusing circle of the diffractometer and covers a range of $\Delta 2\theta = 60^\circ$. Within a few minutes, data were collected from polycrystalline transmission samples and capillaries, and with a furnace as an attachment to the diffractometer phase transitions and solid-state reactions were studied. Some of the results are discussed, the characteristics of the PSD are described and compared with conventional counters. (5 refs.)

76257 PROMETHEUS. A program system for investigation of anharmonic thermal vibrations in crystals. U.H.Zucker, E.Perenthaler, W.F.Kuhs, R.Bachmann, H.Schulz (Max-Planck-Inst. für Festkörperforschung, Stuttgart, Germany).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.358 (1 June 1983). PROMETHEUS is a Fortran IV program system for investigation of anharmonic thermal vibrations in crystals, using elastic X-ray or neutron data. Three different anharmonic-temperature-factor equations can be used, one of them up to sixth-order terms. The corresponding probability densities and mean effective atomic potentials can be calculated. Programs for correction of isotropic thermal diffuse scattering and of isotropic and anisotropic extinction are included. Fast averaging of symmetrically equivalent reflections combined

with extended reflection statistics is possible. Calculations of Fourier syntheses and their errors and of Patterson functions can be carried out and the corresponding contour maps can be plotted. (14 refs.)

76258 Automated fail-safe control system for independent operation of two radiation shutters on a rotating-anode X-ray source. M.T.Short, W.J.Eisler Jr., F.J.Stevens (Argonne Nat. Lab., Argonne, IL, USA).

J. Appl. Crystallogr. (Denmark), vol.16, pt.3, p.359-60 (1 June 1983). The design of certain X-ray-generating rotating-anode devices enables the use of multiple ports through which X-rays can exit for experimental use. However, use of additional ports in such devices raises radiation safety concerns, and all attempts should be made to reduce to a minimum the amount of X-ray exposure. The authors present the design of a safety system which is used with equipment which consists of an Elliott GX-20 rotating anode and two Huber precession cameras (models 200 and 206), to allow the simultaneous operation of both precession cameras with operator safety. (no refs.)

76259 A new method for determining the lattice parameters from powder patterns of orthorhombic crystals. The influence of systematic errors and its partial elimination. A.Lutts (Lab. de Metall. Phys., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium).

Z. Kristallogr. (Germany), vol.161, no.3-4, p.195-207 (1982). The author describes a new method by which it is possible to calculate easily and rapidly the three lattice parameters from the angular position of each diffracted line. Also described is a procedure whereby it is possible to eliminate partially the influence of systematic errors in the square of the axial ratios used for these parameter determinations. This method and procedure is illustrated by an actual example. (8 refs.)

76261 ALCHEMI: a new technique for locating atoms in small crystals. J.C.H.Spence, J.Taft (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA).

J. Microsc. (GB), vol.130, pt.2, p.147-54 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982).

Atom location by channelling enhanced microanalysis (ALCHEMI) is a quantitative technique for identifying the crystallographic sites, distribution and types of substitutional impurities in many crystals. The method involves no adjustable parameters, can be applied to areas as small as a few hundred angstroms and to impurity concentrations down to about 0.1 atomic per cent. It is capable of distinguishing neighbours in the periodic table. The method uses the incident electron beam orientation dependence of characteristic X-ray emission and uses an energy dispersive X-ray microanalyser fitted to a transmission electron microscope. The method does not require the specimen thickness or precise orientation to be known, and makes few assumptions about the form of the dynamical electron wavefunction, which need not be calculated or predicted. The classical problems of cation ordering in spinels, feldspars and olivine have now been studied by this method. (16 refs.)

76262 The relative accuracy of axial and non-axial methods for the measurement of lattice spacings. D.J.Hall, P.G.Self, W.M.Stobbs (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).

J. Microsc. (GB), vol.130, pt.2, p.215-24 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982).

The various different transmission electron microscopical techniques available for the measurement of lattice spacings are discussed, and the limited situations under which lattice fringe spacing measurement is the most appropriate approach are considered. The relative accuracy of measurements on images obtained under axial and non-axial conditions is further considered, and the

generally greater accuracy of the latter technique demonstrated. Further results on the use of the method for the measurement of the carbon content of retained austenite in a dual phase steel are included. (18 refs.)

76263 Direct surface imaging in small metal particles. L.D.Marks (Cavendish Lab., Univ. of Cambridge, Cambridge, England), D.J.Smith. *Nature (GB)*, vol.303, no.5915, p.316-17 (26 May 1983). Atomic-level information about the surfaces of small metal particles has been recorded directly with a 600-kV high-resolution electron microscope. The authors have studied small polycrystalline particles of silver and gold tilted to bring their surfaces parallel to the electron beam. However, unlike previous workers using this normal reflection electron microscopy configuration, they have used conventional bright field axial imaging thereby considerably facilitating image interpretation. As well as clean, sharp surface images, morphological details of catalytic significance, such as the distribution of surface steps, particle faceting and the nature of surface reconstructions, have been obtained. Moreover, detailed computer simulations confirmed that the electron micrographs can be interpreted in terms of atomic columns and, in particular, established that some micrographs showed, for the first time in a transmission electron microscope direct atomic-scale imaging of a reconstructed metal surface. (20 refs.)

76264 Extinction contours by inelastic scattering of electrons. P.Duval, H.Peyre, J.-C.Malaurent, L.Henry (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France). *Philos. Mag. A (GB)*, vol.47, no.5, p.741-51 (May 1983). In French.

By shifting the objective aperture of the electron microscope from the bright-field position to the Bragg reflection dark-field position, Hashimoto (1974) observed that the extinction contour fringes split into two. He concluded that the electrons are inelastically scattered either before or after Bragg reflection. However, the experiments reported show that the splitting is due to the sample parasitic layers. These results can be interpreted using a divergent illumination model of the scattered beam. (5 refs.)

61.20 CLASSICAL, SEMICLASSICAL, AND QUANTUM THEORIES OF LIQUID STRUCTURE (for kinetic and transport theory, see 51.10; for electronic states, see 71.; for liquid helium, see 67.)

76265 Low density properties of a two dimensional dipolar fluid. C.G.Joslin (Dept. of Chem., MIT, Cambridge, MA, USA). *Mol. Phys. (GB)*, vol.49, no.1, p.129-49 (May 1983).

Second and third pressure and dielectric virial coefficients are calculated for a two dimensional fluid of hard discs with embedded central point dipoles. These exact results are compared with the predictions of various integral equation theories based upon the hypernetted chain (HNC) approximation. The linearized (LHNC) equation gives poor pressure virial coefficients B_2^* and C_2^* , but good results for the dielectric coefficients B_2^* and C_2^* . The quadratic (QHNC) equation gives a good approximation to B_2^* and C_2^* , even for large values of the dipole moment μ^* , but C_2^* is very poor and is of the wrong sign for $\mu^* \geq 2.5$. This failure is traced to the arbitrary neglect of rotational invariants other than J_1 , $\Delta(12)$ and $D(12)$ in the eigenfunction expansion of the pair correlation functions $h(12)$ and $c(12)$ of the fluid. The author also computes the critical point of the fluid. The critical constants are very different from those previously calculated in the mean spherical approximation (MSA). (31 refs.)

76266 The extension of pure fluid thermodynamic properties to supercritical mixtures. A comparison of current theories with computer data over a large region of states. C.Hoheisel, U.Deiters (Ruhr-Univ. Bochum, Bochum, Germany), K.Lucas.

Mol. Phys. (GB), vol.49, no.1, p.159-70 (May 1983). Current theories to extend pure fluid thermodynamic properties to supercritical mixtures have been examined by comparison with computer data. Emphasis is placed on a large variation of potential parameter ratios and density. It is found that, while the VDWI approximation is generally the best, its predictions are considerably poorer at supercritical conditions than in the normal liquid range. (20 refs.)

76267 Expansion of single-particle distribution functions with respect to effective long-range potentials. V.L.Kuz'min (Leningrad State Univ., Leningrad, USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.988-73 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.68-76 (Oct. 1982). For a classical system of interacting particles with charges and rigid dipole moments an expansion is constructed with respect to irreducible diagrams for the single-particle distribution function by resummation of the functional series with respect to the electrostatic part of the interaction. This expansion is a series in an effective 'dressed' potential, and in contrast to the original expansion does not contain long-range Coulomb divergences. As an illustration, the asymptotic behavior of the single-particle distribution function in the surface layer of a polar liquid is obtained on the basis of the direct selection and summation of the important diagrams. 61.25 STUDIES OF SPECIFIC LIQUID STRUCTURES

(see also 61.40 Amorphous and polymeric materials)

76268 A theoretical simulation of bulk water. S.Fraga (Dept. of Chem., Univ. of Alberta, Edmonton, Alberta, Canada).

Can. J. Phys. (Canada), vol.61, no.5, p.680-2 (May 1983). A new formulation has been used in the study of a water cluster with 65 molecules. The fact that the calculated average potential energy per molecule agrees with the Monte Carlo result at 300K suggests that this method, which is fast and inexpensive, might be used to obtain estimates of such energies for other systems as well as in generating starting configurations for Monte Carlo calculation. (6 refs.)

76269 Molecular dynamics simulation of liquid water between two walls. M.Marchesi (Istituto per i Circuiti Elettronici, CNR, Genoa, Italy). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.224-30 (13 May 1983).

A molecular dynamics simulation, lasting ≈ 25 ps, has been performed with 150 ST2 water molecules between two quasihard repulsive walls, at a temperature of 302K. A number of static and dynamic properties have been computed as a function of the distance from the walls, showing that water near the walls is in general more 'ordered' than in the bulk, and that this bulk water behaves like ordinary liquid ST2 water. (31 refs.)

76270 Spherical non-draining Boc-poly(α,ϵ -L-lysine) macromolecules: SAXS and viscosity studies. S.M.Aharoni, N.S.Murphy (Corporate Res. & Dev., Allied Corp., Morristown, NJ, USA).

Polym. Commun. (GB), vol.24, no.5, p.132-6 (May 1983). Homologues of t-butyloxycarbonyl blocked poly(α,ϵ -L-lysine) were studied by SAXS and viscosity measurements in DMF. It was found that under rigorously anhydrous conditions no polyelectrolyte effects exist. Macromolecular sizes obtained from both techniques showed a linear dependence on $M^{1/3}$, indicating the macromolecules to be non-draining and spherical in shape. Comparison with calculated sizes indicates the molecules in solution to contain substantial amounts of solvent within their non-draining volumes. The ratio of radius of gyration to hydrodynamic radius, and shape analysis of some SAXS data, indicate that these spherical macromolecules may be somewhat less dense on the surface than their non-draining core. The results are in general agreement with previous results obtained by other techniques. (6 refs.)

76271 Reference interaction site model (RISM) for the liquid structure of oxygen, chlorine and iodine. R.V.Gopala Rao, B.M.Satpathy (Dept. of Chem., Jadavpur Univ., Calcutta, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.92-6 (Feb. 1983).

The reference interaction site model (RISM) equations have been used for fused hard spheres as well as Lennard-Jones (LJ) interaction sites fluids to obtain the site-site distribution functions and the structure function of liquid oxygen, chlorine and iodine. The use of LJ interaction sites improves the result over that of hard sphere calculations of Hsu et al. [Chem Phys (Netherlands), 14 (1976) 213] for oxygen. In chlorine a three (hard sphere interaction)-site model with an auxiliary site at the centre of the molecule works better than a two (LJ)-site model. Liquid iodine has been studied with a three-site model. In the case of oxygen, the agreement is excellent and in the other two cases the RISM theory fails to give a good account of the experimental results and the agreement is only qualitative. The intermolecular potential functions have been obtained for these liquids from the RISM structure function. (11 refs.)

76272 Structure of liquid hydrogen fluoride studied by infrared and Raman spectroscopy. B.Desbat, P.V.Huon (Lab. de Spectroscopie Infrarouge et Raman, Univ. de Bordeaux I, Talence, France).

J. Chem. Phys. (USA), vol.78, no.11, p.6377-83 (1 June 1983). Infrared and Raman spectra of hydrogen fluoride, deuterium fluoride, and their isotopic mixtures at various temperatures from 293 to 77K have been recorded and analyzed in comparison with calculated data obtained from the classical G.F. matrix method applied to hypothetical structures chosen a priori. The best fit lead to the most probable structure of HF at 293K which is a zig-zag chain with six or seven molecules having an angle of 42° with the average axis. At a lower temperature (190K), just before solidification, the chains become longer, $n=8$ with an angle $\theta \approx 35^\circ$. These structures fit well with the high dielectric constant of liquid hydrogen fluoride and lead to a calculated Kirkwood factor $g_1=3.65$ at 293K and $g_1=5.36$ at 190K which are in perfect agreement with known experimental values. (22 refs.)

76273 The HCl-HCl interaction: from quantum mechanical calculations to properties of the liquid. C.Votava, R.Ahlrichs, A.Geiger (Inst. fur Phys. Chem. und Elektrochem., Univ. Karlsruhe, Karlsruhe, Germany).

J. Chem. Phys. (USA), vol.78, no.11, p.6841-8 (1 June 1983). Analytical HCl-HCl pair potentials are derived from large quantum mechanical calculations at CEPA-(SD) level. The computed well depth for the dimer is 1.9 kcal/mol. Those pair potentials are used in molecular dynamics simulation studies at $T=297\text{K}$ and $\rho=0.8354\text{ g/cm}^3$. The results for the static (e.g. pair distribution functions) and dynamic properties are compared with experimental and other molecular dynamics results. Comparison of the results from different simulation runs allows a check on their sensitivity with respect to the pair potential employed. It turns out that the potential yielding the best fit to the computed interaction energies gives a good representation of properties of liquid HCl. However, a readjustment of this potential—in order to account for well-known deficiencies of the quantum mechanical calculations—results in a slight improvement especially in the mean potential energy and the pressure. Finally, the authors used the computed pair potential to determine the structure and association energy of $(\text{HCl})_n$ clusters with cyclic and chain structure. (29 refs.)

76274 Experimental measurements of solvation forces in nonpolar liquids. H.K.Christenson (Dept. of Appl. Math., Inst. of Advanced Studies, Australian Nat. Univ., Canberra, Australia).

J. Chem. Phys. (USA), vol.78, no.11, p.6906-13 (1 June 1983). Forces between molecularly smooth mica surfaces immersed in tetrachloromethane, benzene, and 2,2,4-trimethylpentane have been measured. In tetrachloromethane and benzene the force law is an oscillatory function of the separation between the mica surfaces, with a periodicity equal to the mean molec-

cular diameter and a measurable range of approximately ten periods, or about 5 nm. Beyond this separation, the oscillations merge into a purely attractive 'tail'. In 2,2,2-trimethylpentane the force law shows only short-range oscillatory behavior, below 2 nm; at larger separations the force is everywhere attractive. The results are compared with measurements on cyclohexane, octamethylcyclotetrasiloxane and *n*-octane, including some repeat measurements. When the distance scale is normalized by the mean periodicity of the force curve for each liquid, the results for the four fairly rigid molecules benzene, tetracloromethane, cyclohexane, and octamethylcyclotetrasiloxane are very similar; minor differences possibly being due to varying trace amounts of water in the liquids. In the above systems the force laws are oscillatory functions of the surface separation, with a periodicity roughly equal to the molecular diameter and a measurable range of about ten periods. The peak-to-peak amplitude shows an essentially exponential decay. By contrast, the existence of free intramolecular rotation in the two flexible molecules 2,2,4-trimethylpentane and *n*-octane is sufficient to reduce the solvation forces to 2 nm or less. The results indicate that the amount of liquid structuring for inert liquids depends mainly on the internal rigidity of the molecules, while the effect of molecular shape, size, and temperature is of secondary importance. (40 refs.)

76275 The structure of liquid neon: an anomaly resolved. J.G.Powles, J.L.Abasal (Phys. Labs., Univ. of Kent, Canterbury, England). *J. Phys. C (GB)*, vol.16, no.14, p.L441-4 (20 May 1983).

It is shown that the structure $g(r)$ of liquid neon can be regarded as resulting from an effective interatomic pair-potential of Lennard-Jones 12-6 form with parameters from thermodynamics, provided due account is taken of quantum corrections. Liquid neon therefore 'corresponds' with liquid argon and is not anomalous, as appeared previously to be the case. The novel and useful observation is made that the quantum corrections to $g(r)$ tend to be small for large r . (19 refs.)

76276 One-dimensional models of polymer dynamics. I. Dashpot-spring models applied to a single rotor. M.L.Mansfield (Dept. of Chem., Dartmouth Coll., Hanover, NH, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.773-86 (May 1983). The proposition of Clark and Zimm (1972) that a dashpot and a spring can be used in place of a set of rotational barriers in polymer dynamics is studied. The simplest possible case is examined here, that of a single rotor. Reasons for altering the Clark-Zimm diffusion equation are presented and an alternative diffusion equation is proposed. The results of both diffusion equations for the correlation function $\langle \exp[-i\theta(t)] \exp[i\theta(t)] \rangle$ (θ is the angular position of the rotor) are compared with the correlation function for a rotor in an n -fold cosine potential. Although the two diffusion equations differ, both agree well with the n -fold cosine model for barriers above a few $k_B T$. This agreement is obtained in the absence of adjustable parameters, and motivates the application of these two diffusion equations to polymeric systems. (38 refs.)

76277 One-dimensional models of polymer dynamics. II. A dashpot-spring model. M.L.Mansfield (Dept. of Chem., Dartmouth Coll., Hanover, NH, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.787-806 (May 1983). For pt.I see *ibid.*, vol.21, no.5, p.773-86 (1983). The assumption of Clark and Zimm (1972) that coupled dashpots and springs can be used to model the dynamics of polymer molecules is applied to a model different from that of Clark and Zimm. The dielectric relaxation spectrum of the model is computed in time and frequency domains. The relaxation spectrum can be fitted reasonably well by the empirical Williams-Watts (1970) and Havriliak-Negami functions (1966). The best-fit Williams-Watts and Havriliak-Negami parameters are given as functions of the parameters of the model. The model is compared with several related models found in the literature and possible interpretations are given. (17 refs.)

76278 The melt anisotropy of ultrahigh-molecular-weight polyethylene. A.E.Zachariades, J.A.Logan (IBM Res. Lab., San Jose, CA, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.821-30 (May 1983). In the course of melt-flow crystallization studies with ultrahigh-molecular-weight polyethylene (UHMWPE), it was observed that the melt of UHMWPE is highly anisotropic above its equilibrium melting point and has a tendency to fibrillate. An examination of the melt anisotropy of UHMWPE by optical, thermal, and X-ray analysis indicates that the melt anisotropy persists at 345°C, i.e. the temperature at which the polymer degrades under nitrogen, and appears similar to a smectic liquid-crystalline phase. (11 refs.)

76279 X-ray diffraction analysis of molten potassium bromide. H.Ohno, K.Furukawa (Molten Materials Lab., JAERI, Ibaraki, Japan), R.Takagi, K.Igarashi, J.Mochinaga.

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.3, p.463-71 (March 1983). The radial distribution function of molten KBr has been determined by the X-ray diffraction method and numerical values of the structure, $Q_i(Q)$, $S(Q)$ and $g(r)$ are given. (27 refs.)

76280 Molecular dynamics studies of molten NaI. I. Quasi-elastic neutron scattering. M.Dixon (Dept. of Theoretical Phys., Oxford, England).

Philos. Mag. B (GB), vol.47, no.5, p.509-30 (May 1983). The quasi-elastic neutron scattering spectrum of molten NaI has been calculated using molecular dynamics simulation. The wave-vector dependences of the coherent and incoherent partial contributions to the spectrum are reported. A comparison is made between the spectra obtained from rigid-ion and polarisable-ion model simulations. The spectra are contrasted with those obtained by neutron scattering. (22 refs.)

76281 Molecular dynamics studies of molten NaI. II. Mass-, charge- and number density fluctuations. M.Dixon (Dept. of Theoretical Phys., Oxford, England).

Philos. Mag. B (GB), vol.47, no.5, p.531-54 (May 1983). For pt.I see *ibid.*, vol.47, no.5, p.509 (1983). Molecular dynamics simulations of molten NaI have been performed using both rigid-ion and polarisable-ion models. The mass-, charge- and number-density autocorrelation functions have been calculated together with their frequency spectra. The liquid-state analogues of longitudinal optic and acoustic phonons are identified at longer wavelengths. The acoustic modes are weak and broad. The major differences between the rigid-ion model and the polarisable-ion model are that: (1) there is a substantial difference between their static charge-charge structure factors, $S_{QQ}(q)$, and (2) the normalised charge-charge dynamical structure spectra at longer wavelengths differ in intensity and frequency of the optic mode. The mode for the polarisable-ion model occurs at a lower frequency and is less well resolved. (29 refs.)

61.25M Liquid metals

76282 Structure and thermodynamics of liquid Bi. R.N.Joarder, S.Palchoudhury, R.V.Gopala Rao (Faculty of Sci., Jadavpur Univ., Calcutta, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.151-4 (March 1983).

A thermodynamic perturbation method based on the Gibbs-Bogoliubov inequality has been applied to a nonsimple liquid metal, namely Bi through the Heine-Abarenkov-Animalu pseudopotential and this procedure yields the possibility of two packing densities. A static structure-factor calculation with two packings yields the shoulder characteristics quite reasonably. Calculations of the close packing of the liquid yield satisfactory results. (20 refs.)

76283 Excess enthalpies of liquid (copper+tellurium) alloys. R.Blachnik, B.Gather (Anorganische Chem., FB Chem. Biologie, Univ.-GH-Siegen, Siegen, Germany).

J. Chem. Thermodyn. (GB), vol.15, no.4, p.401-2 (April 1983).

Reports measurements of the excess molar enthalpies H_m^E of liquid copper and tellurium alloy mixtures. The thermal effects measured were those of consecutive additions of small amounts of solid Cu at room temperature (298K) to the calorimetric cell containing liquid tellurium at 727 and 1005K respectively. The small influence of temperature on H_m^E for $\{(1-x)\text{Cu}+x\text{Te}\}$ indicates that the chemical interactions in these melts are of mixed ionic and metallic character. (5 refs.)

76284 The structure of liquid Fe₇₅B₂₅ by neutron scattering. W.Matz (Zentralinst. fur Kernforschung, Akad. der Wissenschaften, Rossendorf, Germany), B.Kunsch, E.Wieser.

Phys. Status Solidi a (Germany), vol.76, no.1, p.K17-20 (16 March 1983).

The authors report the measurement of the structure factor $S(Q)$ of liquid Fe₇₅B₂₅ at temperatures of 1600, 1700, and 1800K by neutron diffraction. In order to avoid the strong neutron absorption by natural boron, boron of 97.2% purity enriched to 99.2% ¹⁰B was used. The neutron diffraction pattern were recorded from $Q=2.5 \text{ nm}^{-1}$ to $Q=89 \text{ nm}^{-1}$ using a neutron wavelength of $\lambda=0.1038 \text{ nm}$. For low values of Q they included the magnetic scattering from spin fluctuations into the paramagnetic cross section. (11 refs.)

61.30 LIQUID CRYSTALS

(see also 64.70M Transitions in liquid crystals)

76285 Optical microstructure of oriented liquid crystal polymers. C.Viney, G.R.Mitchell, A.H.Windle (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).

Polym. Commun. (GB), vol.24, no.5, p.145-6 (May 1983).

Optical microstructures of two thermotropic liquid copolyester samples are presented. Although the samples exhibit pronounced molecular orientation as measured by X-ray diffraction, the optical patterns show no preferred orientation when viewed using crossed polars. These apparently contradictory results suggest that the optical indicatrix is either not uniaxial or that its unique axis is not aligned with the local chain axis, or both. In either case, the structural implication is that there is rotational correlation about the long axes of adjacent molecules. (15 refs.)

76286 Measurement of the surface-tension anisotropy of a nematic liquid crystal. S.R.Nersisyan, V.O.Oganesyan, V.B.Pakhalov, N.V.Tabiryan, Yu.S.Chilingaryan (Erevan State Univ., Erevan, USSR).

JETP Lett. (USA), vol.36, no.8, p.358-61 (20 Oct. 1982). Translation of: *JETP* in Zh. Eksp. & Teor. Fiz. (USSR), vol.36, no.8, p.292-5 (20 Oct. 1982). [received: June 1983]

The surface tension anisotropy factor of the nematic liquid crystal MBBA σ_a is determined experimentally. The magnitude of σ_a , which is measured for the first time, is $\sigma_a \approx 10^{-3} \text{ erg/cm}^2$. (8 refs.)

76287 The mean spherical model (and other approximations) for nematics. T.J.Sluckin (Faculty of Math. Studies, Univ. of Southampton, Southampton, England).

Mol. Phys. (GB), vol.49, no.1, p.221-31 (May 1983).

Kloczkowski and Stecki (1982) have recently found an exact mean spherical approximation (MSA) solution to a simple liquid crystal model. The dependence of the nematic-isotropic transition temperature on potential range and molecular packing fraction is examined using MSA and some other alternative tractable approximations for this model. Some comparison is made with computer simulation results. All the simple approximation schemes, all of which have been used in serious liquid crystal calculations, are heavily deficient. (13 refs.)

76288 Surface anchoring of liquid crystal molecules on various substrates. J.A.Castellano (Stanford Resources Inc., San Jose, CA, USA).

Mol. Cryst. & Liq. Cryst. (GB), vol.94, no.1-2, p.33-41 (1983).

Ever since Mauguin (1911) described the fabrication of liquid crystal cells by rubbing glass plates with paper to obtain uniform homogeneous alignment, scientists have been attempting to study and understand the mechanism of anchoring and the subsequent alignment of these materials on various substrates. More than 35 different methods for creating surface alignment have been reported using both organic and inorganic films as well as various mechanical treatments. Many of these methods are reviewed and categorized. The mechanism of surface anchoring involves not one but several mechanisms. The nature of the surface material, the liquid crystal structure, and the past history of the surface all play major roles in determining the mechanism for a specific technique. (23 refs.)

76289 2,3-dicyanohydroquinone derivative liquid crystals having strong negative dielectric anisotropy. T.Inukai, K.Furukawa, H.Inoue, K.Terashima (Liquid Crystals Div., Chisso Corp., Yokohama, Japan).

Mol. Cryst. & Liq. Cryst. (GB), vol.94, no.1-2, p.109-18 (1983).

Three groups of liquid crystalline derivatives of 2,3-dicyanohydroquinone were synthesized. The dielectric anisotropy values, $\Delta\epsilon$, for these compounds were estimated to be around -20 by extrapolation. Some basic evaluations of these compounds, in view of their application as component materials for the practically usable nematic mixtures of highly negative $\Delta\epsilon$, were made using their solution in a substituted phenyl cyclohexanecarboxylate nematic mixture; $\Delta\epsilon$, viscosity, dichroic ratio of dyes, driving voltages and response times are

described in relation to their molecular length. By use of several selected members of these compounds, one can make practical nematic compositions having $\Delta\epsilon$ of -5 and viscosity of 40 cp at 20° . The guest-host display device can be driven with 3 volts at acceptable response times of $100\sim 200$ milliseconds at room temperatures, to give positive color contrast, i.e. colored in on-state. (7 refs.)

76290 Low viscous compounds of highly nematic character. R.Eidenschink (E. Merck, Zentrallab. fur Industriechemikalien, Darmstadt, Germany). *Mol. Cryst. & Liq. Cryst. (GB)*, vol.94, no.1-2, p.119-25 (1983). Mixtures of broad nematic temperature ranges that permit acceptably short switching times of electro-optical displays at -40°C can be composed of compounds of relatively low polarity and high transition temperatures from the nematic to the isotropic state (T_N). Structures combining 1,4-phenylene and trans-1,4-cyclohexylene rings are particularly suited for this purpose. (30 refs.)

76291 Total internal reflection—a method for determining of LC anchoring and orientation on various substrates. A.I.Derzhanski, H.P.Hinov (Inst. of Solid State Phys., Sofia, Bulgaria), D.Riviere. *Mol. Cryst. & Liq. Cryst. (GB)*, vol.94, no.1-2, p.127-38 (1983). The general problems being important for the determination of the liquid crystal surface anchoring and liquid crystal surface orientation of nematics, large-pitch cholesterics, and some smectics by means of attenuated total internal reflection (ATR) of a visible light beam have been outlined. The advantages and disadvantages of ATR for measuring of the surface energy have been discussed and compared with those of other well-known methods. The possible influence of additional orienting and/or conducting layers on the reflectivity and polarization of the incident wave are also briefly discussed. (88 refs.)

76292 New liquid crystal materials; physical properties and performance in displays for automobile, high information density and guest-host applications. M.Schadt, M.Petrzlik, P.R.Gerber, A.Villiger, G.Tricks (Central Res. Units, F. Hoffmann-La Roche & Co. Ltd., Basel, Switzerland). *Mol. Cryst. & Liq. Cryst. (GB)*, vol.94, no.1-2, p.139-53 (1983). Four novel liquid crystal classes are presented, namely bi-, tri-, and tetracyclic ethanes, pyridazines, and tetracyclic chloro-dieters. Each class exhibits distinct physical characteristics, such as low viscosities $\eta\sim 12$ cP, low elastic ratios $k_{33}/k_{11}\sim 1$, large mesomorphic ranges $\sim 40^\circ\text{C}\dots 250^\circ\text{C}$, large negative dielectric anisotropies $\Delta\epsilon\sim -9$ and/or low dielectric relaxation frequencies $f_c\sim 1$ kHz. It is shown that the dielectric Debye relaxation time τ characterizing the hindered rotation of polar nematic molecules around their short axes is much more affected by molecular structural factors than by their rotational viscosity η . The material and electro-optical properties of mixtures for twisted nematic and guest-host LCDs comprising the new compounds are presented. The mixtures cover a wide range of applications such as high contrast, fast and multiplexable automotive TN-LCDs; positive and negative contrast guest-host LCDs; high-information density matrix, and dual-frequency addressable LCDs. (20 refs.)

76293 Relation between TN-cell response time and transition temperatures of liquid crystal materials. A.Mukoh, H.Abe, T.Kitamura, N.Kamezawa, M.Satoh (Hitachi Res. Lab., Hitachi Ltd., Ibaraki, Japan). *Mol. Cryst. & Liq. Cryst. (GB)*, vol.94, no.1-2, p.155-65 (1983). The relation between the transition temperature of typical nematic liquid crystal mixtures and the dynamic properties of twisted nematic (TN) cells are presented. The extrapolated response time at the nematic-isotropic transition temperature is of use as a relative response time in the comparison of liquid crystal materials with each other. The glass transition temperature of liquid crystal mixtures is one of the best indicators of the dynamic properties of TN-cells. The linear relation between the reciprocal ΔT , and the logarithm of the reciprocal response time led the authors to believe that they could improve the response time of TN-cells by producing liquid crystal materials with lower T_g s. They assumed that the lower limit for the response time of TN-cells at 25°C is about $10\sim 20$ ms from the above relation. (10 refs.)

76294 Thermal behavior of two polar A-smectics. D.Guillon, G.Poeti, A.Skoulies (Centre de Recherches sur les Macromolécules, Strasbourg, France). *Mol. Cryst. & Liq. Cryst. Lett. (GB)*, vol.92, no.2, p.35-9 (1983). The experimental X-ray diffraction data reported recently in the literature for a cyano and a nitro smectogen are used to calculate some parameters of the smectic A phase, such as the molecular area of the paraffin tails and the degree of head to head association of the molecules. It is shown that the presence of a lateral methyl group on the aromatic cores enhances the head to head association of the molecules. It is, finally, suggested that the slight interruption observed in the temperature variation of the layer spacing could be related to a poor miscibility of the head to head and the side by side associated molecules. (6 refs.)

76295 Dynamics of a Fredericks transition in side chain nematic polymers: determination of the viscoelastic coefficients K_1 and γ_1 . C.Casagrande, M.Veyssie, C.Weill (Lab. de Phys. de la Matière Condensée, Coll. de France, Paris, France), H.Finkelmann. *Mol. Cryst. & Liq. Cryst. Lett. (GB)*, vol.92, no.2, p.49-55 (1983). Reports measurements of the splay elastic constant, K_1 , and the twist viscosity coefficient, γ_1 , of side chain mesomorphic polymers; they compare them to the values obtained for certain low molecular weight compounds, similar to the nematic moiety of the polymers. (4 refs.)

76296 Stable liquid crystals with large negative dielectric anisotropy. II. M.A.Osman, T.Huynh-ba (Brown Boveri Res. Center, Baden, Switzerland). *Mol. Cryst. & Liq. Cryst. Lett. (GB)*, vol.92, no.2, p.57-62 (1983). 2,3-Dicyano-4-n-pentyl phenol was synthesized. The mesomorphic properties of its benzoic and cyclohexane carboxylic acid esters are described. The effect of lateral substituents on the thermodynamic stability of the mesophase is discussed. The esters of this phenol are photochemically stable LCs with large negative $\Delta\epsilon$. Their clearing points are relatively high but their viscosities are expected to be also relatively high. (10 refs.)

76297 Orientational fluctuations of a lyotropic nematic liquid crystal measured by quasielastic light scattering. S.Kumar, L.J.Yu, J.D.Litster (Dept. of Phys., MIT, Cambridge, MA, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1672-5 (23 May 1983). The nematic-isotropic and the nematic-to-lamellar phase changes in the lyotropic liquid crystal formed by decylammonium chloride micelles in a water-ammonium chloride solution have been studied by light scattering. The former transition shows behavior identical to that observed in thermotropic liquid crystals. The nematic-lamellar transition appears closely similar to a thermotropic nematic-smectic-A change and the elastic constants diverge according to the analogy to superfluid helium and the three-dimensional xy model. (12 refs.)

76298 Optical method for determination of anchoring energy of tilted nematic layers. L.Komitov, A.G.Petrov (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.137-43 (16 March 1983). By measuring the surface tilt angles in a hybrid nematic layer with homogeneously tilted and reversely tilted (splayed) parts, the strength of anchoring can be obtained. The theory and some experimental demonstrations of the method are presented. For SiO_2 coating and MBBA liquid crystal, the measured anchoring energy is 4×10^{-6} J/m². (12 refs.)

76299 X-ray diffraction studies on the mesophases of n-p-cyanobenzylidene-p-octyloxy aniline in magnetic field. B.Jha, B.Bhattacharjee, S.Paul, R.Paul (Phys. Dept., North Bengal Univ., Darjeeling, India). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.461-6 (16 April 1983). X-ray diffraction is studied for n-p-cyanobenzylidene-p-octyloxy aniline in both, nematic and smectic phases ordered by a magnetic field. The orientational distribution function and the order parameters at different temperatures are calculated. From the temperature variation of the distribution function, an approximate expression for the potential of the molecular field is obtained. The layer spacings in the smectic phase and intermolecular distances at different temperatures and different magnetic fields are determined. The average intermolecular distances are found to be dependent on the magnetic field strength. (25 refs.)

76300 Microdiffraction applied to thermotropic liquid crystalline polymers. A.M.Donald (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *Philos. Mag. A (GB)*, vol.47, no.5, p.L13-17 (May 1983). The usefulness of electron 'microdiffraction' techniques for studying orientation in sheared films of a thermotropic liquid crystalline polymer is demonstrated. Patterns recorded from regions ~ 150 nm in diameter exhibit much higher degrees of orientation than is apparent in conventional selected-area diffraction patterns. Local variations in the micro-orientation axis can be detected as the specimen is traversed. (8 refs.)

76301 Mean-field model for antiferroelectric smectic-A liquid crystals. L.Longa, W.H.de Jeu (Solid State Phys. Lab., Univ. of Groningen, Groningen, Netherlands). *Solid State Commun. (USA)*, vol.46, no.9, p.693-6 (June 1983). A theoretical description is proposed for recently observed antiferroelectric smectic-A phases. Order parameters are introduced that retain information on the head-tail asymmetry of the constituent molecules and minimum ingredients are given for an averaged model potential. The calculations show that for high orientational order the antiferroelectric smectic-A structure is the best compromise between dipole repulsion and dispersive attraction. The resulting phase diagrams compare favorably with the experimental situation. (9 refs.)

76302 'Nonclassical' temperature dependence of the order parameter of nematic liquid crystals. E.M.Aver'yanov, V.A.Zhukov, V.Ya.Zrnyanov, Yu.I.Ruolene, V.F.Shabanov (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1861-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3279-82 (Nov. 1982). [received: May 1983] Infrared polarization spectroscopy was used to determine the absolute values of the orientational order parameter s of four liquid crystals belonging to the homologous series of alkoxycyanobiphenyls. The Landau theory is used to justify the familiar empirical approximation $s=s_0(1-T/T_c)^{\beta}$ and a qualitative interpretation is given of the 'nonclassical' values of the parameters $s_0\neq 1$ and $\beta=0.18\pm 0.04$. (13 refs.)

76303 Induced cholesteric systems with negative temperature dependences of the helical pitch. N.L.Kramarenko, L.N.Lisetskii, L.G.Derkach (A.M. Gorki State Univ., Kharkov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1863-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3283-5 (Nov. 1982). [received: May 1983] It is shown that a negative temperature dependence of the helical pitch p may occur in the case of liquid-crystal systems formed by a nonsmectogenic nematic with small admixtures of cholesteryl esters. The sign and value of dp/dT are governed by the degree of anharmonicity of the rotational vibrations of molecules associated with the characteristic features of their geometric shape. (13 refs.)

76304 Translational order in smectic liquid crystals. Allowance for features of the intermolecular forces. L.N.Lisetskii. *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1909-12 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3361-5 (Nov. 1982). [received: May 1983] The mean molecular field approximation is used to discuss translational ordering in smectic mesophases. Qualitative features arising from the inclusion of successive terms in the Fourier expansion of the model potential are noted. The model developed can be used to describe not only the phase transition but also smectic, A-nematic transitions between different smectic mesophases, as well as translational melting of molecular crystals of mesogenic substances. (12 refs.)

76305 Second-sound soliton in a liquid crystal. I.V.Ioffe, B.I.Lembrikov. *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1958-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3446-8 (Nov. 1982). [received: May 1983] Influence of nonlinear effects during propagation of wave packets in dispersive media results in the appearance of solitons. The authors show that a second-sound soliton can be excited by a modulated electromagnetic wave propagating in a smectic A liquid crystal along a direction inclined to the layers. Such a soliton can be observed in the same way as second-sound waves. (8 refs.)

76306 Nature of the flexoelectric effect in MBBA. A.S.Vasilevskaya, A.V.Kaznacheev, A.S.Sonin. *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2118 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3714-15 (Dec. 1983). A comparison of the temperature dependences of the flexoelectric coefficient and of the order parameter should make it possible to determine the contribution of particular multiples to the flexoelectric polarization. The authors have investigated the temperature dependence of the flexoelectric coefficient e_2 in a nematic liquid crystal of MBBA with a negative dielectric anisotropy. (7 refs.)

76307 Orientational effects in the mesophase under short laser pulses; nonlinearity buildup. S.M.Arakelyan, O.V.Garibyan, A.S.Karayan, Yu.S.Chilligaryan (State Univ., Erevan, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.452-4 (Sept. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1051-6 (Sept. 1982). [received: May 1983] Strong orientational effects in the mesophase are believed to be extremely slow and are taken into account only for the case of CW (or quasi-CW) laser

beams. On the other hand, it was noted experimentally a long time ago that even nanosecond-pulse lasers of sufficiently high power ($p \geq 1$ MW) can cause light-induced (orientational) macroscopic structural distortions in nematic liquid crystals. The authors report the first theoretical and experimental study of this effect. (9 refs.)

61.40D Glasses

- 76310 Non-isothermal analysis of the crystallization of the amorphous germanium dioxide. A.Montenero, E.Baiocchi (Istituto di Chimica Fisica, Parma, Italy), M.Bettinelli, L.Di Sipio, A.Sotgiu. *Mater. Chem. & Phys. (Switzerland)*, vol.8, no.4, p.379-86 (April 1983).
 The amorphous germanium dioxide devitrification has been investigated, with particular regard to the kinetic aspects and to the crystallization mechanism. The amorphous material transforms into the hexagonal dioxide modification, which is metastable at the considered temperatures. This fact is in accordance with the presence of tetrahedrally coordinated Ge in both the glass and the devitrified material. The crystallization kinetics are investigated by means of the DTA technique; a rigorous method of analysis enables the determination of the activation energy E_{act} , the Arrhenius preexponential factor A and the morphological index n characteristic of the devitrification reaction. (17 refs.)
 76311 The structural analysis of $\text{Li}_2\text{O} \cdot 2\text{SiO}_2$ glass and melt by Raman spectroscopy. N.Iwamoto, N.Umesaki (Welding Res. Inst., Osaka Univ., Ibaraki, Japan), K.Dohi. *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.382-9 (1983). In Japanese.
 Raman spectra for $\text{Li}_2\text{O} \cdot 2\text{SiO}_2$ glass and melt at different temperatures were measured by using the high temperature Raman spectroscopic technique. Raman spectra observed in the frequency range from 800 to 1200 cm^{-1} consist of three Raman bands near 940-50, 1000-10 and $1050-80 \text{ cm}^{-1}$. These bands are attributed to the Si-O stretching vibrations of SiO_3^{2-} chain, SiO_2 three-dimensional network and $\text{Si}_2\text{O}_7^{2-}$ sheet silicate anions with two, zero and one non-bridging oxygens per silicon atom, respectively. The fractions of the three silicate anions in $\text{Li}_2\text{O} \cdot 2\text{SiO}_2$ glass and melt were calculated from the area intensities of the three bands. Above the glass transition temperature T_g increased. However, there is only little difference between the Raman spectra of glass and melt, so that it is suggested that the glass structure is roughly similar to the corresponding melt structure. Furthermore, the coordination numbers of the nearest neighbour correlations Si-Si, O-Si and O-O in $\text{Li}_2\text{O} \cdot 2\text{SiO}_2$ glass and melt were estimated from the fractions of the three silicate anions, and were in good agreement with the values in $\text{Li}_2\text{O} \cdot 2\text{SiO}_2$ crystal. (28 refs.)

76312 Glass formation in the system of $(\text{CaO}, \text{Na}_2\text{O})\text{-Fe}_2\text{O}_3\text{-(SiO}_2, \text{B}_2\text{O}_3, \text{GeO}_2)$ and some physical properties of $\text{CaO-Fe}_2\text{O}_3\text{-SiO}_2$ glasses. N.Soga, H.Nasu, R.Ota (Faculty of Engng., Kyoto Univ., Kyoto, Japan). *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.354, p.322-6 (March 1983). In Japanese.

The glass forming regions in the systems of $\text{Na}_2\text{O-Fe}_2\text{O}_3\text{-Fe}_2\text{O}_3\text{-(SiO}_2 \text{ or } \text{B}_2\text{O}_3)$ and $\text{CaO-Fe}_2\text{O}_3\text{-(SiO}_2, \text{B}_2\text{O}_3 \text{ or } \text{GeO}_2)$ were determined. (Na_2O or $\text{CaO-Fe}_2\text{O}_3\text{-SiO}_2$ glasses were found to be capable of containing up to 30 mole% Fe_2O_3 , while (Na_2O or $\text{CaO-Fe}_2\text{O}_3\text{-(B}_2\text{O}_3 \text{ or } \text{GeO}_2)$ glasses up to 20 mole% Fe_2O_3). The glass forming region in the system (Na_2O or $\text{CaO-Fe}_2\text{O}_3\text{-(SiO}_2 \text{ or } \text{B}_2\text{O}_3)$ was narrower than that in the system (Na_2O or $\text{CaO-Fe}_2\text{O}_3\text{-(SiO}_2 \text{ or } \text{B}_2\text{O}_3)$). Although the density of the $\text{CaO-Fe}_2\text{O}_3\text{-SiO}_2$ glasses increased linearly with Fe_2O_3 content when CaO/SiO_2 ratio was kept constant, the molar volume increased with Fe_2O_3 content. On the other hand at constant Fe_2O_3 content, the molar volume decreased with increasing CaO/SiO_2 ratio. This implies that Fe_2O_3 tends to loosen the glass structure and CaO to tighten the glass structure in the systems containing less than 40 mole% SiO_2 . (10 refs.)

76313 Influence of directed chemical bonding on the structure of metallic glasses. Two-dimensional model. H.Hermann (Zentralinst. für Festkörperphys. und Werkstofforschung, Akad. der Wissenschaften, Dresden, Germany). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.185-95 (1 May 1983).
 Non-central potentials are used to describe directed chemical bonding due to metalloids in amorphous metal-metalloid systems. Average atomic volume, partial pair distribution functions, local symmetries, and correlation functions of symmetry coefficients are calculated for two-dimensional model systems produced numerically by simultaneously carrying out density variation and energy relaxation. The model reproduces qualitatively essential experimental results. (13 refs.)

76314 Neutron diffraction study of 2 $\text{TeO}_2 \cdot \text{V}_2\text{O}_5$ glass. S.Neov, I.Gerassimova, B.Sydzhimov (Inst. of Nuclear Res. & Nuclear Energy, Bulgarian Acad. of Sci., Sofia, Bulgaria).

Phys. Status Solidi a (Germany), vol.76, no.1, p.297-301 (16 March 1983).
 The short-range atomic order is investigated in a glass composed of 66.7 mol% TeO_2 and 33.3 mol% V_2O_5 using the neutron diffraction method. It is established that the coordination state of the Te atom changes at the transition into the glassy state—in 65% of the cases the TeO_4 groups pass into TeO_3 pyramids with an averaged Te-O distance of 0.196 nm. On the basis of the structural data obtained, the results of X-ray diffraction and IR-spectroscopy, a plausible model of the glass structure is proposed. (14 refs.)

76315 Electron microscopy and electron diffraction study on crystallization of metastable phases in amorphous Fe-B alloys. P.Duhaj (Inst. of Phys., Electro-Phys. Res. Centre, Slovakian Acad. of Sci., Bratislava, Czechoslovakia), F.Hanic. *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.467-77 (16 April 1983).

Crystallization is investigated of amorphous $\text{Fe}_{100-x}\text{B}_x$ where $x=14, 16, 18, 20$ at.% alloys using electron microscopy and electron diffraction. Above the eutectical composition, the crystallization in the alloys begins with the tetragonal metastable Fe_3B and the ordered cubic Fe_2B phases. Below the eutectical composition besides the Fe_3B phase an orthorhombic supersaturated solid solution $\alpha\text{-Fe}_{23}$ with an order-disorder arrangement of B-atoms is formed. Both instable supersaturated solid solution ($\alpha\text{-Fe}_{23}$), Fe_3B , and tetragonal Fe_2B contain similar short range order arrangements of Fe-B atoms in the form of bridging groups. (20 refs.)

76316 On nucleation of crystallization in CoB_{30} glasses. U.Koster, H.Blank (Univ. Dortmund, Dortmund, Germany). *Scr. Metall. (USA)*, vol.17, no.4, p.495-9 (April 1983).

Presents results of an investigation on the nucleation behaviour in CoB_{30} glasses, which have been found to form spherical eutectic cells during crystallization. Such an isotropic shape is the prerequisite for deriving a relation between the diameter distribution of these cells embedded in the amorphous matrix and the distribution of their circular intersections revealed in an arbitrary plane through the partially crystallized ribbon. (9 refs.)

76317 Molecular dynamics studies of the structures and properties for halide glasses. K.Hirao, N.Soga (Dept. of Industrial Chem., Kyoto Univ., Kyoto, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.1, p.11-17 (1983).
 The molecular dynamics calculations on halide glasses assuming ionic potential functions were made in order to obtain the correlation between the structure and properties. The results of computations on the metastable liquid and glassy state of AgI and ZnCl₂ are presented. The statistical mechanics of the glasses and the glass transition were obtained. The volume and enthalpy as functions of temperature showed that sudden changes in the derivative of the volume-temperature and the enthalpy-temperature plot occurred in the region of 0.6 T_m . (16 refs.)

76318 Calculation of the crystallization behaviour of metallic glasses. H.W.Bergmann, H.U.Fritsch (Inst. für Werkstoffkunde und Werkstofftech., Univ. Clausthal, Clausthal, Germany).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.225-8
 A method is proposed to calculate the crystallization behaviour of multicomponent metallic glasses with several phases. Various geometric shapes of precipitate can be considered. The model also takes into account changes in concentration which arise during precipitation. (5 refs.)

76319 Influence of Cr, Mn, Co and Ni on the crystallization behaviour of $(\text{Fe}_{1-x}\text{M}_x)_2$ metalloids, metallic glasses. H.W.Bergmann, U.Brokmeyer (Inst. für Werkstoffkunde und Werkstofftech., Univ. of Clausthal, Clausthal, Germany).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.235-41

The influence of Cr, Mn, Co and Ni on the thermodynamic properties (molar heat of fusion, heat of crystallization and melting temperature), crystallization behaviour and hardness was studied in $(\text{Fe}_{1-x}\text{M}_x)_2\text{B}_{17}$ as a function of the x content. The crystallization behaviour can be described by three parameters which enables an extrapolation to longer times. (5 refs.)

76320 Crystallization behavior and properties of rapidly solidified Ni-Mo-B alloys. C.C.Wan (AiRes. Casting Co., Torrance, CA, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.441-7
 The crystallization phenomena of certain ternary glass Ni-Mo-B alloys and their consolidated bulk properties, including age hardening effects after proper heat treatment, are investigated. Within the composition range studied, the glassy alloys crystallize by a two-stage process—first by forming a metastable microcrystalline structure of Ni solid solution at temperature around 490-530°C followed by boride precipitation at temperatures around 700-770°C.

The boride, which is identified by X-ray diffraction as Mo_2NiB_3 , grows to submicron size after the alloys have been thermally treated at 1000°C and above for certain periods of time. Microstructural analysis shows borides isolated and well dispersed in Ni-Mo alloy matrix. Age hardening is achieved by precipitating the Ni/Mo intermetallic compound(s) in Ni-Mo matrix at an intermediate temperature of previously solutionized samples. Another characteristic is the high eutectic temperature. This allows the alloys to be hot consolidated to full density by certain commercially available processes, such as hot isostatic pressing, while still maintaining the unique microstructure inherited from rapid solidification process. Hardness, hot hardness and hot tensile properties of some consolidated alloys are discussed. (9 refs.)

76321 Micromechanisms of crystallization in (Fe,Co,Ni)-Zr metallic glasses. H.-G.Franke, U.Koster, H.-W.Schroeder (Abteilung Chemietechnik, Univ. Dortmund, Dortmund, Germany), J.Muller. Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.455-60. Depending on the Zr-concentration crystallization of (Fe,Co,Ni)-Zr glasses has been found by TEM studies to occur by primary and polymorphic crystallization but not by eutectic crystallization reactions. Nucleation and growth rates of these reactions have been analyzed systematically. Thermal stability as indicated by growth as well as nucleation rates decreases with increasing Zr-content and atomic number of the late transition metal. Using this knowledge on nucleation and growth rates, conditions for designing particular microstructures by crystallization reactions can be predicted. (10 refs.)

76322 On the problem of cross links in trans-polyacetylene: normal-coordinate calculations. G.Zannoni, G.Zerbi (Dipartimento di Chimica Industriale e Ingegneria Chimica, Politecnico di Milano, Milan, Italy).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.147-51 (13 May 1983).

Normal-coordinate calculations are carried out on a simple model of a cross link in trans-polyacetylene (PA). The results indicate the need for a reanalysis of the presently accepted vibrational assignment of trans-PA and suggest the need for a more thorough chemical study of purposely cross-linked PA. The authors consider vibrational spectra as a possible tool for the molecular characterisation of PA. The analysis of the infrared and Raman spectra of trans-PA indicates that some medium-weak lines were left unexplained by the various author who focused their attention on the contributions to the spectra of a perfect chain. (26 refs.)

76323 Modified two-phase model for the mechanical properties of the semicrystalline polymer—polyethylene. P.K.Biswas, S.Sengupta (Phys. Dept., Presidency Coll., Calcutta, India), A.N.Basu.

Indian J. Pure & Appl. Phys., vol.21, no.2, p.73-7 (Feb. 1983).

A phenomenological model for semicrystalline polymer is proposed which takes into account both variation of crystallinity and orientation of the molecular chains with the direction of draw. The elastic properties of the polymer are calculated in terms of those of the constituent phases as in Takayanagi's (1973) model. At the drawn state it has been shown that a partially oriented crystalline phase may be considered as a superposition of a perfectly aligned crystalline portion on a polycrystalline phase. The model contains only two adjustable parameters. The model is applied in the case of high density polyethylene and the agreement of the predicted values of the elastic moduli along the direction of draw and perpendicular to it and shear modulus are in close agreement with the experimental values. (16 refs.)

76324 Structure property relationship in unsaturated polyamides. A.Ray, M.M.Maiti, S.Maiti (Materials Sci. Centre, Indian Inst. of Technol., Kharagpur, India).

Int. J. Polym. Mater. (GB), vol.10, no.1, p.21-37 (1983).

Unsaturated polyamides from fumaric acid and ortho-, meta- and para-phenylene diamine were prepared by thionyl chloride activated low temperature polycondensation in polar solvents. The polymers were found to be soluble in highly polar solvents. The solubility parameter of the polymers was calculated from Small's group contribution, which agreed well with the experimental values. X-ray diffraction study revealed that the polymers were amor-

phous. The isomeric effect on the thermal and electrical properties of polymers was discussed. (24 refs.)

76325 Relaxation function of linear polymers. G.M.Bartenev, Z.P.Shul'man, B.M.Khusid (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).

J. Eng. Phys. (USA), vol.43, no.3, p.1002-6 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.425-30 (Sept. 1982).

The relaxation function of linear polymers possessing a discrete relaxation time spectrum is analysed. (11 refs.)

76326 Preoriented poly(ethylene terephthalate) yarns: influence of the gauche-trans transformation on crystallization. R.Galli, M.Canetti, P.Sadocco, A.Seves, L.Vicini (Stazione Sperimentale per la Cellulosa, Carta e Fibre Tessili, Vegetali ed Artificiali, Milano, Italy).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.717-23 (May 1983).

Effects of macromolecular orientation on the crystallization of preoriented poly(ethylene terephthalate) filaments were studied. Infrared spectrophotometry and differential scanning calorimetry analyses showed that macromolecular segments in the trans conformation begin to crystallize below the glass transition temperature. Since filaments prepared by stretching at room temperature have different degrees of orientation, it is possible to evidence correlations between crystallization from an anisotropic matrix and the resulting morphology. 76327 Crystal structures containing five atoms per primitive cell. M.Hosoya (Dept. of Phys., Univ. of the Ryukyus, Okinawa, Japan).

Bull. Coll. Sci. Univ. Ryukyus (Japan), no.35, p.9-52 (March 1983).

Enumeration of the species in genus ABCDE, ABCD₂, ABC₂, AB₂C₂, AB₄, A₂B₃, and A₅ is carried out. Their numbers are 52, 236, 356, 484, 520, 642, and 373 respectively. New notation of the species is proposed. (4 refs.)

76328 Line profiles for a collection of identical crystals: effect of a linear transformation of shape. G.Allegre (Istituto di Chimica, Politecnico di Milano, Milano, Italy), A.J.C.Wilson.

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.280-2 (1 May 1983).

A linear transformation is defined as a distortion of the unit lengths along three Cartesian axes and of their angles, preserving the same covariant coordinates of the corresponding points. The mathematical relationship between the line profiles of two mutually transformed crystals is proposed. It makes it possible, for example, to get the line profiles for ellipsoids, parallelepipeds, distorted tetrahedra and octahedra from the exact results reported by Langford & Wilson (1978) for spheres, cubes, regular tetrahedra and octahedra. (9 refs.)

76329 N-dimensional coincidence-site-lattice theory. M.A.Fortes (Dept. de Metalurgia, Univ. Tecnica de Lisboa, Lisboa, Portugal).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.351-7 (1 May 1983).

A matricial theory of coincidence-site and displacement-shift-complete (DSC) lattices of arbitrary dimension is developed. Vector bases for these lattices can easily be determined from particular factorizations of the matrix defining the relative orientation. Various properties of the two lattices are derived, including the reciprocity relations. The general conditions for coincidence and the problem of coincidence in sublattices of lower dimension are also discussed. (27 refs.)

76330 CO/N₂ solid solutions: head-tail reorientations. Shang-Bin Liu, M.S.Conradi (Dept. of Phys., Coll. of William and Mary, Williamsburg, VA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6901-5 (1 June 1983).

The rates of CO reorientation in α -phase solid solutions of CO/N₂ were determined with dielectric spectroscopy. The activation energy is found to be an increasing and approximately linear function of the CO concentration x , similar to the transition temperature T_{tr} . The extrapolated activation energy for CO reorientation in α -N₂ is compared to that in pure α -CO: the transition temperatures and libration frequencies of α -N₂ and α -CO are also compared. Evidently, the same interactions control T_{tr} , the librations, and the energy barriers to reorientation. The CO dipole moment magnitudes determined from the dielectric data are all about 30% below the free molecule value. Not all of this discrepancy is ascribable to incomplete filling of the cell to the solid sample and librational reduction of the effective moment. (28 refs.)

76331 Ice crystal morphology and growth rates at low supersaturations and high temperatures. S.C.Colbeck (US Army Cold Regions Res. & Engng. Lab., Hanover, NH, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2677-82 (May 1983).

At an excess vapor density (supersaturation of about 10^{-4}) adjacent to the ice crystal surface of 5.6×10^{-10} g/cc, there is a transition between the high faceted kinetic growth form and the rounded equilibrium form at temperatures above -6°C . At lower temperatures there is a transition in the equilibrium form to hexagonal prisms because of a reduction in the disordered

surface layer. The growth rate of ice crystals from the vapor is analyzed by a simple model which accounts for vapor flow and surface processes separately. The conditions for highly temperature sensitive growth are identified from the model. (17 refs.)

76332 The effect of Soret diffusion on the morphological stability of a binary alloy crystal. D.T.J.Hurle (Royal Signals & Radar Establ., Great Malvern, England).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.463-72 (April-May 1983).

The classic Mullins-Sekerka analysis (1964) of the morphological stability of the interface of a crystal growing from a dilute binary alloy melt is reworked with inclusion of Soret diffusion. As expected, for reasonable values of the Soret coefficient, the criterion for interface breakdown is not significantly altered. However, it is found that for solutes having small segregation coefficients ($k < 1$), the critical wavelength, at which the breakdown first occurs, is markedly altered both under conventional growth conditions and for the extreme conditions encountered with pulsed laser beam annealing. The physical reasons for the effect are elucidated. (10 refs.)

76333 Interface shape studies for silicon ribbon growth by the EFG technique. I. Transport phenomena modeling. J.P.Kalejs (Mobil Solar Energy Corp., Waltham, MA, USA), L.-Y.Chin, F.M.Carlsion.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.473-84 (April-May 1983).

The influence of process parameters on the interface shape of silicon ribbon grown by the edge-defined film-fed growth (EFG) technique has been studied with the help of finite element solutions of the heat and mass transport equations. The interface shape is calculated to be convex toward the melt for a wide range of growth parameters. Significant inhomogeneities of segregated impurities through the ribbon thickness are associated with this interface shape for impurities with segregation coefficients much less than unity. The influence of asymmetry in the geometry and temperature fields on interface configuration and solute segregation is examined. Interface tilt produced by this asymmetry is shown to lead to deviations from normal segregation behavior at large tilt angles. (11 refs.)

76334 Interface shape studies for silicon ribbon growth by the EFG technique. II. Effect of die asymmetry. J.P.Kalejs (Mobil Solar Energy Corp., Waltham, MA, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.485-93 (April-May 1983).

For p.t.I see *ibid.*, vol.61, no.3, p.473-84 (1983). Interface shapes in silicon ribbon EFG (edge-defined film-fed growth) have been investigated experimentally with the examination of ribbon grown with asymmetry in the interface environment created by modifying die geometry in the ribbon thickness dimension. Changes in ribbon properties are examined in view of the predictions for interface configuration and impurity segregation behavior obtained from finite element modeling of heat and mass transport processes. (8 refs.)

76335 Crystal growth and temperature variation of the lattice parameters in LaF_3 , CeF_3 , PrF_3 and NdF_3 . W.Korczak, P.Mikolajczak (Experimental Phys. Dept., Inst. of Phys., Marie Curie-Skłodowska Univ., Lublin, Poland).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.601-5 (April-May 1983).

The growth of REF_3 ($\text{RE} = \text{La, Ce, Pr, Nd}$) single crystals by the Bridgman-Stockbarger method is described. The temperature dependence of the lattice parameters a and c and the thermal expansion coefficients α of these materials in the range of 87-291K are reported. (7 refs.)

76336 Mathematical model for corundum single crystal growth by Verneuil method. R.Grzymkowski, B.Mochnacki, J.Suchy (Silesian Polytech. School, Gliwice, Poland).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.629-36 (April-May 1983).

A mathematical model which is an attempt to describe the complex process of monocrystallization by the Verneuil method is presented. The problem has been solved through the method of finite differences and at the same time making use of a certain modification of the mathematical description of Stefan's problem called the alternating phase truncation method. The elaborated algorithm and the examples of solutions given at the end of the present study point at the usefulness of the presented method of numerical simulation for modern designing and controlling the processes of crystal production. (10 refs.)

76337 Segregation during directional melting and its implications on seeded crystal growth: a theoretical analysis. E.D.Bourret, J.J.Favier, A.F.Witt (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.681-8 (April-May 1983).

Directional melting of binary systems in the absence of convection is analyzed for concurrent compositional changes at the crystal-melt interface. It is shown that steady-state conditions cannot normally be reached during seeding and that the growth interface temperature during the ensuing initial stages of growth is a function of backmelt conditions. The theoretical treatment is numerically applied to $\text{Hg}_{1-x}\text{Cd}_x\text{Te}$ and Ga-doped Ge. (10 refs.)

76338 Polarity identification of CdTe crystallites. H.Iwanaga, T.Yoshiie (Faculty of Liberal Arts, Nagasaki Univ., Nagasaki, Japan), S.Takeuchi, K.Mochizuki.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.691-4 (April-May 1983).

The crystal polarity of CdTe with the zincblende structure has been shown to be identifiable by triangular etch pits developed on the {110} plane which is easy to obtain as the cleavage plane or the growth habit plane. Examples are given of identifying the growth polarity of as-grown crystallites. (9 refs.)

76339 On the influence of natural convection on mass transfer process in gallium phosphide crystal growth from solution. L.L.Regel, Nguyen Thanh Nghi (Space Res. Inst., Acad. of Sci., Moscow, USSR).

Mater. Res. Bull. (USA), vol.18, no.4, p.499-506 (April 1983).

Mass transfer process under various (space and terrestrial) conditions of crystal growing from solution have been considered. Dimensionless criteria from the reduced mass transport equation for the boundary layer approximation have been used to estimate the conditions at which natural convection occurs and how large its effect is. The data of the on-ground and Salyut-6 orbital station experiments have helped to determine the phosphorus diffusion coefficients in the liquid gallium in the temperature range 1000-1100°C and to give possible reasons for deviation of some parameters from experimental data given by other authors. Comparison of crystal growth results on Earth and in space was used to reveal a quantitative relationship between the growth rate and convection intensity. (20 refs.)

76340 Theoretical and experimental study of growth sector boundaries in deuterated potassium dihydrogen phosphate single crystals. S.Grosswig, J.Hartwig, U.Schellenberger, W.-D.Zimmer (Friedrich-Schiller-Univ., Jena, Germany).

Phys. Status Solidi a (Germany), vol.76, no.1, p.241-7 (16 March 1983).

An analytical model is applied to describe the lattice deformation of a growth sector boundary. The theoretical results are compared with precision lattice parameter measurements and with contrast distributions in double crystal topographs. A good qualitative agreement can be stated. The width of the area where a strong lattice parameter change appears can be estimated. (18 refs.)

76341 LEC growth of InP(Mn) for p-type and semi-insulating materials. R.E.Nahory, A.A.Ballman, H.Brown, M.R.Wilson (Bell Labs, Holmdel, NJ, USA).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.7-14.

Both p-type and semi-insulating InP bulk crystals have been grown with the use of Mn impurities, which are found to be deep acceptors with ionization energy near 0.3 eV. Several 200-gram ingots were prepared with $p = 3 \times 10^{14}$ to $5 \times 10^{16} \text{ cm}^{-3}$ at 300K. Under the proper conditions, semi-insulating material was also grown, with resistivity of 10^7 ohm-cm at 300K. (6 refs.)

76342 Reproducibility and uniformity considerations in LEC growth of undoped, semi-insulating GaAs for large-area, direct implantation technology. L.B.Ta, R.N.Thomas, G.W.Eldridge, H.M.Hobgood (Westinghouse R&D Center, Pittsburgh, PA, USA).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.31-9.

Large diameter ($\leq 75 \text{ mm}$) undoped GaAs crystals grown by the LEC technique from As-rich melts exhibit reproducible high resistivity, thermal stability and predictable implantation characteristics in contrast to semi-insulating Ga-rich material which exhibits a p-type conversion after prolonged annealing at 860°C, resulting from the outdiffusion of EL2 deep donors revealing uncompensated residual carbon acceptors at the wafer surface. It has been found empirically that factors such as crystal-crucible rotation and pull speed in LEC growth affect the radial and slice-to-slice uniformity during implantation. Crystals grown under conditions of co-rotation of seed and crucible often exhibit significant radial variations in measured sheet resistance and mobility with characteristic p-type cores in the wafer centers after 860°C/15 minute annealing. Counter-rotation and slow pull rates are found to be beneficial in the growth of GaAs substrates with radially uniform semi-insulating behavior and thermal stability. (11 refs.)

61.50E Crystal symmetry; models and space groups, and crystalline systems and classes

76343 Space-group symmetry and the joint probability distribution of the magnitude and phase of a triple product: an unexpected result in the eleven pairs of chiral spacegroups. W.M.G.F.Pontenagel, H.Krabbandam (Lab. voor Struikturechem., Rijksuniv., Utrecht, Netherlands).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.333-40 (1 May 1983).

The main term of the probability distribution of a triple product in an arbitrary space group is derived via the central limit theorem. The results are in general identical to those obtained by Giacovazzo (1980) i.e. in any space group the well known distribution functions for P_1 and P_1 are valid for general triple products and triple products with restricted phase angles, respectively, provided a suitable weight is applied. However, in the eleven pairs of enantiomorphously related space groups it is found that there are triple products for which the most probable phase angle assumes a value different from zero. As an example, in P_4 , the most probable phase for the triple product $E_{221}E_{401}E_{223}$, given its magnitude, appears to be -45° . (11 refs.)

76344 Point-group determination by convergent-beam electron diffraction. M.Tanaka, R.Saito, H.Sekii (Dept. of Phys., Tohoku Univ., Sendai, Japan).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.357-68 (1 May 1983).

The method of point-group determination from convergent-beam electron diffraction patterns has been established by Buxton et al. (1976). However, Table 2 given by them is inconvenient for practical purposes, since many symmetries of the dark-field and $\pm G$ dark-field patterns are not given and are left for the reader's consideration. The table is improved and completed with the help of some new symmetry symbols and illustration of symmetries. The new table makes the point-group determination easy and quick. The symmetries of the symmetrical many-beam convergent-beam electron diffraction patterns have been studied by Tinnappel (1975) using group theory. It is shown that the graphical method used by Buxton et al. can reveal the symmetries of these patterns. A method of point-group determination which uses three types of symmetrical many-beam patterns, the hexagonal six-beam,

square four-beam and rectangular four-beam patterns, is described. This method requires only one photograph in determining most diffraction groups. This fact means that the method is more convenient and reliable than that of Buxton et al., since their method requires two or three photographs for most cases. Experimental results which verify the theoretical ones are given. The characteristic features of the symmetrical many-beam method are discussed. (12 refs.)

76345 Geometric units in tetragonal crystal structures. C.Chieh (Guelph-Waterloo Centre for Graduate Work in Chem., Univ. of Waterloo, Waterloo, Ontario, Canada).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.415-21 (1 May 1983). Tetragonal space groups are classified from the geometric-unit view point by considering crystal structures as a result of combinations and permutations of some basic polyhedral units. There are nine patterns among two categories represented by four units packed on the (110) and (100) planes. Category (I) consists of five types with four units packed on the (110) plane. The centers of these units are $0,0,0$; $0,0,1/2$; $1/2,1/2,0$ and $1/2,1/2,1/2$. In that order, the patterns can be represented by $ABCD$, $AA'BB'$, $ABA'B'$, $ABBA'$ and $AA'A'A'$. Each letter represents an independent unit; primes are used to indicate one of the following orientation relationships: identity, fourfold rotation, mirror plane parallel to (110), and mirror plane parallel to (100). These units have the shape of tetragonal prisms and they stack in the same way as the crystallographic unit cells. Category (II) has four types packed on the (100) plane and the centers of these units are at $0,0,0$; $0,1/2,1/4$; $0,0,1/2$ and $0,1/2,3/4$. In that order, the patterns can be represented by $ACBD$, $ABA'B'$, $AA'BB'$ and $AA'A'A'$. The ideal polyhedra for category (II) are truncated tetragonal prisms or flattened truncated octahedra depending on the axial ratio c/a . For simplicity, these polyhedra are transformed into tetragonal prisms so that all geometric units have the same shape. Units in category (II) stack in an interlocking fashion, like the work of a bricklayer. The overlap displacements for the interlocking are in the (001) direction. The symmetries of the geometric units in some space groups depend on the choice of origin, but a shift to equivalent origins changes neither the packing patterns nor the symmetries of the geometric units. (19 refs.)

76346 Application of an algebraic method to isolate a basic system from a vector system. V.A.Lebedev, E.A.Soldatov, E.A.Kuz'min, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevskii State Univ., Gorki, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.509-11 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.73-6 (July 1982). [received: April 1983]

The authors have developed an algorithm which is executed on a BESM-6 computer in the form of a program written in FORTRAN. The operation of the program can be arbitrarily divided into the following states: 1) Calculation of the coefficients $b_i(hkl)$ from individual experimental structure factors $|U(hkl)|^2$; 2) location of the interatomic function with storage of the coordinates of the points and their weights; 3) construction, from the modified coefficients $b_i(hkl)$, of superposition functions of rank M with the aid of the solution of the system of polynomials; 4) calculation of the weights of the points on the superposition function as the sum of the weights of the interatomic vectors from the given atom to the other atoms. (3 refs.)

76347 Criterion for a structure to belong to a homometric set. V.G.Rau, T.F.Rau, V.V.Ilyukhin, N.V.Belov (P.I. Lebedev-Polyanskii State Pedagogical Inst., Vladimir, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.513-15 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.80-3 (July 1982). [received: April 1983]

The authors find a broader criterion for belonging in those cases when the vector system is not a grid system. One should expect that in this case as well the criterion may prove to be based on the VS pseudosymmetry, which arises as the composition of local symmetry elements of the subsystem. (4 refs.)

76348 On some distinctive features of cyclotomic Patterson sets. V.G.Rau, L.G.Parkhomov, V.V.Ilyukhin, N.V.Belov (P.I. Lebedev-Polyanskii State Pedagogical Inst., Vladimir, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.521-3 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.336-9 (July 1982). [received: April 1983]

In previous publications, (see *ibid.*, vol.25, p.960, 1980) using combinatorial methods of number theory the authors have obtained formulas for calculating the number of cyclotomic Patterson sets. An investigation of the relation between the sets of coordinates of these sets discloses a number of distinctive features typical of linear basic systems. In the present paper they attempt an analysis of these features, within the framework of the general problem of seeking the conditions of existence of homometric sets and calculating and constructing them. (5 refs.)

76349 Special cases of symmetry of reciprocal phase space. E.V.Chuprunov, T.N.Tarkhova, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevskii State Univ., Gorki, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.585-6 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.874-7 (Aug. 1982). [received: May 1983]

In a number of cases associated with the solution of the phase problem, it is necessary to know and take account of the symmetry of the distribution of the phases of the structure amplitudes, independently of their absolute values. For a given crystal structure, the authors assign to each site of its reciprocal lattice a real number ϕ , $0 \leq \phi \leq \pi$, equal to the phase of the corresponding structure amplitude. The resulting space is called the reciprocal phase space (RPS). The group of motions which transform into themselves when the phase relations of the RPS are taken into account are called the symmetry group of the RPS. Symmetry groups of RPS are supergroups of the symmetry groups of the Fourier space. (5 refs.)

76350 On the characteristic equations of crystallographic matrices. E.A.Soldatov, A.E.Kuz'min, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevskii State Univ., Gorki, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.587-8 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1390-2 (Aug. 1982). [received: May 1983]

Symmetry transformations in N -dimensional space can be represented by a group of matrices. If the matrices of this group are integral, then such a group is crystallographic, i.e., for certain lattices in their primitive basis the group expresses rotations of these lattices into themselves. The integrality of a finite group of (unimodular) matrices is a sufficient condition for the existence of such lattices. It is shown that the 'crystallographic nature' of the matrices is associated with more general properties than their integrality and unimodularity; to be precise it consists in distinctive features of the spectrum of eigenvalues of these matrices. 76351 Packing analysis and calculation of sublimation energies of borane crystals. T.Beringhelli (Istituto di Chimica Generale ed Inorganica, Univ. di Milano, Milano, Italy), G.Filippini, A.Gavezotti, M.Simonetta. *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.51-61 (June 1983).

Using known X-ray crystal structures of boranes, some indices related to crystal stability and close-packing are obtained. An examination of possible non-bonded potential functions for boron atoms in crystals is carried out, and by using suitably rescaled hydrocarbon functions, the sublimation energies of boranes are calculated. Correlations with the number of boron atoms in the molecule and molecular volumes are found. Potential energy barriers for large-amplitude molecular reorientations are also calculated and are found to be of the same order of magnitude as lattice energies for many borane crystals. (9 refs.)

76352 A cusp-constrained scattering factor for bonded hydrogen atoms. R.Van Der Wal, R.F.Stewart (Dept. of Chem. Phys., Univ. of Groningen, Groningen, Netherlands).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.422-4 (1 May 1983). A simple one-parameter form factor that satisfies a cusp condition has been developed. A one-parameter form factor, based on a 1s-type density function, is more tractable in a least-squares analysis than the corresponding cusp-constrained form factor. Application of both form factors for bonded hydrogen atoms to X-ray diffraction data of sucrose revealed a more contracted density for H bonded to C compared to H bonded to O. (11 refs.)

76353 On the logarithmic potential potential form for the short-range interactions in alkali halide crystals. R.K.Gupta, P.S.Bakhshi, J.Shanker (Dept. of Phys., Agra Coll., Agra, India), A.J.Kaur.

Indian J. Pure & Appl. Phys., vol.21, no.3, p.180-1 (March 1983). The logarithmic potential for short-range repulsive interactions in alkali halides used by recent workers does not give good account of the cohesive energy. The suitability of this potential with and without including van der Waals interactions has been examined. The potential parameters and from them the cohesive energies are calculated and compared with the experimental values. The logarithmic potential form is inferior to the already known and frequently used exponential potential form. (11 refs.)

76354 A polynomial relationship for lattice energy in crystals. A.P.Kajwadkar, L.K.Sharma (Dept. of Appl. Phys., Government Engng. Coll., Jabalpur, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.193-4 (March 1983). The generalized form of Born-Mayer equation without compressibility term has been modified and a polynomial of the type

$U_L = U_{ELBC}[k - 0.3729x + 0.0695x^2 + \dots]$ has been suggested for rapid and easy calculation of lattice energy in crystals. The relation is applied to calculate lattice energy in more than 40 different crystals. The results obtained show marked improvement over those reported by earlier workers. (10 refs.)

76355 On the mechanical stability of BCC transition elements and alloys. E.S.Machlin, J.Shao (Henry Krumb School of Mines, Columbia Univ., New York, NY, USA).

J. Phys. & Chem. Solids (GB), vol.44, no.5, p.435-44 (1983). A volume independent and a volume dependent lattice energy function involving short-range interatomic potentials were able to be fitted to the elastic constants, cohesive energy, lattice parameter and for the latter function to the vacancy formation energy and BCC-FCC lattice stability energy, as well, for FCC metals and BCC alkali metals, but not to the cohesive energy and C elastic constant of BCC transition metals. The assumption that directional, but partial, covalent bonds exist between nearest-neighbours in the BCC transition elements provides an explanation for the latter results and in addition explains the identical dependence of C' and the BCC-FCC lattice stability upon N_d , where N_d is the average number of d electrons, for the BCC transition metals and alloys. Both the mechanical and thermodynamic stability of the BCC structure for transition metals and all transition metal alloys disappears for $5-N_d \geq 2$ and < -1 . (19 refs.)

76356 Expansion of electrostatic multipole interaction energies of tetragonal, hexagonal and trigonal crystals in terms of strain tensor components. P.Herzig (Inst. fur Phys. Chem., Univ. Wien, Wien, Austria).

Solid State Commun. (USA), vol.46, no.9, p.685-8 (June 1983). The electrostatic multipole interaction energy of a crystal formulated within the spherical tensor rotation in a previous paper is expanded in terms of strain components. The method by Nijboer and de Wette (1957) can be used to calculate the required lattice sums. Expansions of this type are particularly useful to evaluate lattice energies by a minimization procedure, but other possible applications are also suggested. As examples, the electrostatic energies of tetragonal $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$ and of compounds with the chalcopyrite structure are expanded as functions of the axial ratio c/a , and, in the second case, also in terms of the internal parameter u . (15 refs.)

76357 The calculation of the electrostatic lattice energy of polar crystals by slice-wise summation, with an application to BeO. P.Hartman (Inst. voor Aardwetenschappen, Rijksuniversiteit Utrecht, Utrecht, Netherlands). *Z. Kristallogr. (Germany)*, vol.161, no.3-4, p.259-63 (1982). In the calculation of the electrostatic part of the lattice energy of polar crystals by slice-wise summation, as occurs in the Madelung method, an extra energy term, E_{corr} , is needed. This term is due to a double limit to infinity, one parallel to the slices, the other perpendicular to them. It was found that $E_{\text{corr}} = -2\pi\mu^2/V$, where μ is the dipole moment of the slice and V the unit cell volume. The method is applied to BeO. (10 refs.)

76358 The measurement of inner potential for diamond, germanium and silicon. D.E.Ashenford, N.D.Lisgarten (Phys. Dept., Imperial Coll., London, England).

Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.311-14 (1 May 1983). Measurements of the inner potentials for diamond, germanium and silicon have been made using the Shinohara method and Kikuchi lines. In the case of germanium, a method has been derived which allows the use of crystals appreciably off-cut from nominal $\{hkl\}$ artificially prepared faces. The mean values obtained are 18.2 V for diamond, 13.4 V for germanium and 10.9 V for silicon. Comparisons are made with previous experimental results and theoretical calculations. (11 refs.)

76359 The recursion method and the electronic charge density in diamond and silicon. R.Jones, T.King (Dept. of Phys., Univ. of Exeter, Exeter, England).

Philos. Mag. B (GB), vol.47, no.5, p.491-3 (May 1983). A method for calculating the electronic charge density in a small region at the centre of a cluster of atoms by means of the recursion method is presented. The results of the application of this technique to diamond and silicon are discussed. (4 refs.)

76360 Compounds with the structural type of ThMn_{12} in rare earth metal-gallium-iron systems. I.A.Griniv, O.I.Godovanets, R.V.Lapunova, Yu.M.Grin, Ya.P.Yarmolyuk.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.74-7 (1983). In Ukrainian.

Crystal structure of $\text{SmGa}_{0.5}\text{Fe}_{1.5}$ has been studied by the X-ray powder method: structure type ThMn_{12} , space group $14/mmm$, $a=0.8671(6)$, $c=0.5090(3)$ nm; 2 Sm in $2(a) 000$, 8 Fe in $8(f) 1/4 1/4 1/4$; $8\text{Ga}_{0.86}\text{Fe}_{0.14}$ in $8(i) x 00$, $x=0.336$; $8\text{Ga}_{0.86}\text{Fe}_{0.14}$ in $8(j) x 1/20$, $x=0.285$; R_1 -value is 0.116 for 40 reflections. Coordination numbers of atoms are: 20 for Sm; 12 for Fe; 12, 14 for Ga. Homogeneity ranges of compounds with ThMn_{12} type structure have been studied at 600°C for systems of Ce, Pr, Nd, Gd, Tb, Dy, Ho, Er, Tm, Yb, Y and lattice parameters have been determined. (8 refs.)

76361 Intermediate phases of vanadium-rhenium system. V.N.Eremenko, A.M.Kharkova, T.Ya.Velikanova.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.77-80 (1983). In Ukrainian.

The structure of vanadium-rhenium alloys and intermediate phases are studied by X-ray (Debye, diffractometric), optical microscopy, microdurometry and determination of the superconducting transition temperatures in a range of 69-86 at.% Re. The σ -phase is formed at the AB_3 composition. Its lattice constants are: $a=0.944\pm0.001$ nm, $c=0.489\pm0.001$ nm in the alloy containing 76 at.% Re, space group D_{4h}^{14} , structural type D8_h . The lower temperature limit of the σ -phase existence ranges between 1723 and 1773K. At the composition 71 at.% Re A -phase is formed, its structural type is $A-15$ (Cr_3Si), space group $\text{Pm}\bar{3}\text{n}$, $a=0.48783\pm0.00007$ nm. It is formed in peritectoid reaction $\alpha+\epsilon=A$ at the temperature range of 2223 and 2473K and undergoes the eutectoid disintegration $A\rightleftharpoons\alpha+\epsilon_1$ at about 1373K. (8 refs.)

76362 Crystal structure and magnetic susceptibility of RCuSn system. L.P.Komarova, R.V.Skolozdra, I.V.Filatova.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.81-3 (1983). In Ukrainian.

Crystal structure of LaCuSn and YCuSn was determined and magnetic susceptibility of RCuSn compounds ($R=\text{Y, La, Ce, Pr, Nd, Sm, Gd, Tb, Dy, Ho, Er, Tm, Lu}$) in a temperature range of 78-293K was measured. The structure of LaCuSn is isotypic of AlB_2 -type, the structure of other compounds belongs to CaIn_2 -type. Compounds with Y, La, Lu are Pauli paramagnetics, magnetic susceptibility of the other compounds, except SmCuSn , is described by the Curie-Weiss law. Effective magnetic moments of these compounds are in good agreement with the theoretical values for free R^{2+} ions; the moment of SmCuSn is 0.78 μ_B . (4 refs.)

76363 Allowance for a three-body potential in a theory of short-range order of dilute binary alloys. L.A.Bol'shov (Polytech. Inst., Vologda, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.636-42 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

The pair and three-body potentials are used to obtain an expression for the pair correlation function of a binary alloy in an approximation which is linear in the solute concentration. (14 refs.) A.T.

76364 Parametrized functionals of the local electron density in transition metals. Yu.A.Khon (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.643-8 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

An expression is obtained for the total energy of transition metals in the form of a functional of the local electron density containing parameters. An analysis of the correctness of the functionals obtained in this way is verified by calculating the atomic properties of some 3d-metals. (17 refs.) A.T.

76365 Possible equilibrium states of the zirconium-hydrogen system in the low temperature limit. I.G.Ratishvili (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.665-75 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

The published experimental data are used to study the likely nature of ordering of hydrogen in the Zr-H system and the results are then used to identify the states of the system which should correspond to the lowest energy of the hydrogen atom subsystem at $T=0\text{K}$. (21 refs.) A.T.

76366 Structural changes in martensite observed in high-nickel steel as a result of low-temperature heating. L.I.Lysak, V.E.Danil'chenko, Ya.N.Vovk, V.A.Okhrimenko (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.717-23 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

The X-ray diffraction method was used to study structural changes in α -martensite during heating of high-nickel steel single crystals. The study was carried out between liquid nitrogen temperature and 100°C. Changes in the diffraction spots and diffuse fringes of α -martensite led to the conclusion of formation of twins in the $\{011\}\{011\}$ system and of precipitation of carbon in these twins and in the matrix martensite. (13 refs.) A.T.

76367 Short-range ordering in nickel-chromium thermocouple alloys. D.D.Pollock (Dept. of Mech. & Aerospace Engng., State Univ. of New York, Buffalo, NY, USA).

J. Test. & Eval. (USA), vol.11, no.3, p.225-6 (May 1983).

A short-range, lattice-ordering mechanism has been used extensively to explain the anomalous thermoelectric properties of such alloys as Chromel and Nicrosil. This concept appears to have had its origin in early crystallographic work that postulated this mechanism to explain experimentally observed changes in the relative electrical resistance of nickel-chromium alloys. Later crystallographic work, confirmed by several additional investigators, shows no evidence for the existence of short-range order in nickel-chromium alloys containing less than 25 at.% Cr. Since short-range ordering has not been established as being responsible for the thermoelectric properties of nickel-chromium alloys, this mechanism may not arbitrarily be considered as the sole rationale for their behaviors. (17 refs.)

76368 Electron microscopy study of two new long period structures in Pt_3Ti alloys ($3\leq x\leq 8$). D.Schryvers, J.van Landuyt, G.van Tendeloo, S.Amelinck (Rijksuniversiteit Antwerpen, Antwerp, Belgium).

Phys. Status Solidi a (Germany), vol.76, no.2, p.575-93 (16 April 1983).

Alloys with compositions varying between Pt_3Ti and Pt_3Ti are studied by means of electron diffraction and high resolution electron microscopy. The Pt_3Ti superstructure is confirmed and it is found that also in this case the light minority atoms can be revealed in high resolution images as bright dots under suitably chosen imaging conditions. Two new long period antiphase boundary structures based on the face centered cubic structure are determined: (a) an orthorhombic one-dimensional superstructure with composition $\text{Pt}_{13}\text{Ti}_2$ and (b) a tetragonal two-dimensional superstructure with composition $\text{Pt}_{21}\text{Ti}_4$. Descriptions of several faults in the microtexture of these superstructures are given. (9 refs.)

76369 Neutron diffraction study of the $\text{Ni}_2\text{Mn}_{1-x}\text{Cr}_x\text{Sn}$ system. W.Bazela-Wrobel, A.Szytula (Inst. of Phys., Tech. Univ. of Cracow, Cracow, Poland).

Phys. Status Solidi a (Germany), vol.76, no.2, p.K117-20 (16 April 1983).

Reports on structural and magnetic properties of cubic $\text{Ni}_2\text{Mn}_{1-x}\text{Cr}_x\text{Sn}$ obtained by means of X-ray and neutron diffraction as well as magnetometric methods. (8 refs.)

61.60 SPECIFIC STRUCTURE OF INORGANIC COMPOUNDS

76370 The crystal structure of $\text{K}_2\text{Si}^{\text{IV}}\text{Si}^{\text{IV}}\text{O}_6$. D.K.Swanson, C.T.Prewitt (Dept. of Earth & Space Sci., State Univ. of New York, Stony Brook, NY, USA).

Am. Mineral. (USA), vol.68, p.581-5 (May-June 1983).

The crystal structure of $\text{K}_2\text{Si}^{\text{IV}}\text{Si}^{\text{IV}}\text{O}_6$ has been refined in space group $\text{P6}_3/\text{m}$ to an $R=2.02\%$ and is confirmed to be isotypic with wadeite ($\text{K}_2\text{ZrSi}_2\text{O}_6$). The atomic charges of $\text{Si}^{\text{IV}}\text{O}_4$, $\text{O}(1)_{\text{br}}$ and $\text{O}(2)_{\text{br}}$ are +3.3, +2.5, -1.4 and -1.4, respectively, and suggest that an increase in the coordination number of a Si atom from 4 to 6 significantly increases the ionic character of that atom. The mean octahedral Si-O distance, 1.778 Å, compares well with that predicted by an empirical equation, 1.781 Å.

76371 Unusual cell volume behavior in the $\text{LaNb}_{1-x}\text{V}_x\text{O}_4$ system. A.T.Aldred (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).

Mater. Lett. (Netherlands), vol.1, no.5-6, p.197-9 (April 1983).

The crystal structures and lattice constants of the $\text{LaNb}_{1-x}\text{V}_x\text{O}_4$ system have been determined at room temperature. The system undergoes a monoclinic to tetragonal phase transformation with an increase in x analogous to the transition as a function of temperature in pure LaNbO_4 . The unit cell volume increases with an increase in x in the monoclinic phase despite the fact that

vanadium is a smaller ion than niobium. A more normal contraction of the cell volume is observed in the tetragonal phase. The origin of this unusual behavior is unclear at present. (12 refs.)

76372 On the crystal structure of some non-stoichiometric mixed lead oxide halides and their relation to the minerals 'Loretoite' and 'Sundiusite'. B. Aurivillius (Div. of Inorganic Chem., Lund Inst. of Technol., Lund, Sweden). *Chem. Scr. (Sweden)*, vol.22, no.1, p.5-11 (1983).

Synthetic lead oxychloride, $\alpha\text{-Pb}_2\text{O}_6\text{Cl}_2$, isotypic to the now discredited mineral loretoite, has previously been assigned a pseudo-tetragonal unit cell, ASTM Card 6-0393. It is shown here that a phase with this metrics can not be obtained on melting pure PbO and pure PbCl₂ in inert crucibles. Phases with the metrics of $\alpha\text{-Pb}_2\text{O}_6\text{Cl}_2$ have previously been obtained by the present author on contaminating compounds $7\text{PbO}\cdot\text{PbX}_2$, $\text{X}=\text{Cl}$, Br or I, with oxides of the elements R: Si, Ge, P, V, As, Mo and W. The general idealized formula of these compounds is $(7-n)\text{PbO}\cdot n\text{RO}_3\cdot\text{PbX}_2$. Their crystal structures are disordered but their subcells are found to consist of $(\text{Pb}, \text{R})_4\text{O}_4\pm\epsilon^+$ blocks and X^- layers. Ideally the unit cells contain $10(\text{Pb}+\text{R}+\text{X})$ layers. The present work deals with chlorides and bromides where $\text{R}=\text{Ti}$, Nb, Ta, S and Cr. Single crystal diffractometer data were collected for $6\text{PbO}\cdot\text{NbO}_3\cdot\text{PbBr}_2$, $6.5\text{PbO}\cdot0.5\text{SO}_3\cdot\text{PbCl}_2$ and $6.5\text{PbO}\cdot0.5\text{CrO}_3\cdot\text{PbCl}_2$. The data could be interpreted by means of the above structure. The R -factors and number of observed reflections are in turn: 0.1237, 192 independent; 0.0589, 195 independent and 0.0774, 495 ($hkl\pm hkl$). Synthetic $8\text{PbO}\cdot\text{PbSO}_4\cdot\text{PbCl}_2$ prepared on reacting the components in platinum crucibles at 640 or 780°C is poly-phasic with an observed density of 8.0 Mg m^{-3} . (6 refs.)

76373 X-ray diffraction study of basal (ab)-plane structure and diffuse scattering from silver atoms in disordered stage-2 $\text{Ag}_{0.18}\text{TiS}_2$. K.-I. Ohshima, S.C. Moss (Dept. of Phys., Univ. of Houston, Houston, TX, USA). *Acta Crystallogr. Sect. A (Denmark)*, vol.A39, pt.3, p.298-305 (1 May 1983). X-ray results are presented on the crystallographic parameters in the basal (ab) plane and the short-range order diffuse scattering from intercalated silver atoms in disordered stage-2 $\text{Ag}_{0.18}\text{TiS}_2$ at room temperature. The silver atoms in the intercalated plane occupy the octahedral sites and the in-plane temperature parameter of the silver atoms has a value of $B=3.0\pm0.1\text{ Å}^2$, suggesting both weak bonding and correspondingly rapid diffusion. Rodlike diffuse scattering parallel to c^* at $1/3, 2/3, 0$ and their equivalent positions is observed and reveals the three-dimensional (2D) feature of the disordered state. From analyzing this 2D diffuse intensity by the method of Borie & Sparks (1971), the planar short-range order parameters were determined. A comparison of this planar short-range order with the 2D Ornstein-Zernike correlation function demonstrates the long-range nature of the 2D short-range order with a correlation range κ^{-1} of $4.88\pm0.4\text{ Å}$. Using a linearized mean-field approximation for the correlation functions of a binary Ising system well above T_c developed by Clapp & Moss (1966), a set of oscillatory atomic-pair interaction potential ratios was obtained where the direct interactions were significant out to at least four to five neighbors. (21 refs.)

76374 Electron density in NaF and KCl crystals in the self-consistent local-density-functional approximation (LDA). G. Bobel, P. Cortona (Istituto di Sci. Fisiche, Univ. di Genova, Genova, Italy), C. Sommers, F.G. Fumi. *Acta Crystallogr. Sect. A (Denmark)*, vol.A39, pt.3, p.400-7 (1 May 1983). The electron density $\rho(r)$ in NaF and KCl crystals—composed of 'isoelectronic' alkali and halogen ions—has been computed self-consistently by the method of augmented spherical waves in the local-density-functional approximation (LDA). Calculations were also carried out of the heat of formation of the salts from the alkali metal and the halogen molecule from the pertinent total energies as well as the diamagnetic susceptibility of the solid. The structure factors were then calculated for the low-order 'difference' and 'sum' reflections, the former of which are particularly sensitive to ionic deformations. The computed structure factors are compared with the structure factors obtained from experiment. The latter are also compared with the structure factors calculated from the Hartree-Fock free-ion atomic factors. The conclusion is that in the NaF and KCl crystals the anion 'contracts' and the cation 'expands' in passing from the free-ion state to the state of the ion in the crystal. Independent evidence of this type of effect is provided by the Tessman et al. (1953) 'ionic polarizabilities' and by the Fumi & Tosi, Tosi & Fumi (1964) 'crystal ionic radii'. (77 refs.)

76375 X-ray, crystal data, magnetic susceptibility and electrical conductivity of hydrated trnickel pentasulphide. J.P. Mishra, Lakshmi (Dept. of Chem., Univ. of Gorakhpur, Gorakhpur, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.3, p.69-72 (Feb. 1983). The compound, hydrated trnickel pentasulphide, has been prepared in solid state condition. X-ray powder diffraction pattern of the compound shows cubic structures with $a=8.503\text{ Å}$ and $Z=3$. The magnetic susceptibility measurement shows that the compound is paramagnetic in the temperature range 305-715K with Curie constant $C=1.62\text{ K emu/mol}$ and effective magnetic moment $p=3.60\text{ } \mu_B$ (Bohr magnetron). The electrical conductivity measurement explains the impurity levels and intrinsic semiconducting behaviour in the temperature range 313-433K and 533-713K with activation energy 0.05 and 0.60 eV respectively. Above 713K, the compound becomes metallic. Thermogravimetric analysis and differential analysis data indicate the presence of nonstoichiometric compound and dehydration step. The density of the compound is found to be $3.20\pm0.10\text{ g/cc}$. (8 refs.)

76376 Cation distribution from Cu²⁺ temperatures in slow cooled and quenched copper ferrite samples. S.A. Patil (Phys. Dept., Shivaji Univ., Kolhapur, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.182-3 (March 1983). Curie temperatures for slow cooled and quenched copper ferrite samples are used to compute cation distribution using Gillet's formula. Cation distribution is discussed on the basis of oxygen nonstoichiometry and square bond formation of Cu^{2+} in copper ferrite. The deviation in theoretical and experimental magnetic moment values may be due to randomly distributed Cu^{2+} ions in oxygen interstices and formation of Fe^{3+} ions on B sites. (14 refs.)

76377 Fe_3PO_7 , a case of Fe^{3+} fivefold coordination. Structural and magnetic studies. A. Modaresi, A. Courtois (Lab. de Chimie du Solide Mineral, Univ. de Nancy, Nancy, France), R. Gerardin, B. Malman, C. Gleitzer. *J. Solid State Chem. (USA)*, vol.47, no.3, p.245-55 (May 1983). In French. The structure of Fe_3PO_7 is established from a single crystal. The cell is trigonal $R\bar{3}m$, with, in hexagonal reference $a=8.006(5)$, $c=6.863(5)\text{ Å}$, $Z=3$. The structure is determined with the direct method and refined to $R=0.027$. The PO_4 tetrahedra are isolated; the iron atoms are in a five coordinated site constituted of trigonal bipyramids sharing 2 edges and forming groups of 3 hexahedra; through these shared edges the iron atoms are at 3.13 Å a distance rather short which brings a repulsion causing the off centering of the cation along the pseudo axis of the bipyramid. The magnetic measurements and the Mossbauer spectroscopy show antiferromagnetic behaviour and, in the paramagnetic state, outstanding parameters ($\mu=6.45\text{ } \mu_B$, $\theta_p=-1707\text{ K}$) recalling however $\text{Ca}_2\text{Fe}_2\text{O}_5$ or LaFeO_3 . The Mossbauer spectroscopy gives, at room temperature, parameters classical for trivalent

iron; through cooling, it points to a magnetic transition temperature of $160\pm3\text{ K}$ below which the spectrum displays at least 2 hyperfine patterns. The magnetic interactions are discussed. (44 refs.)

76378 Crystal structure of $\text{Fe}_2\text{P}_2\text{O}_7$. J.T. Higgins (Ventures Res. Div., Ashland Chem. Co., Dublin, OH, USA), J.S. Swinnea, H. Steinfink. *J. Solid State Chem. (USA)*, vol.47, no.3, p.278-83 (May 1983). $\text{Fe}_2\text{P}_2\text{O}_7$ crystallizes in the $C1$ space group with lattice parameters $a=6.649(2)\text{ Å}$, $b=8.484(2)\text{ Å}$, $c=4.488(1)\text{ Å}$, $\alpha=90.04^\circ$, $\beta=103.89(3)^\circ$, $\gamma=92.82(3)^\circ$, and $\rho_{\text{calc}}=3.86\text{ g/cc}$. It is essentially isostructural with $\beta\text{-Zn}_2\text{P}_2\text{O}_7$. As in the Zn compound, the bridging oxygen atom in the P_2O_7 group shows a high anisotropic thermal motion. It appears that the P-O-P bond angle is linear as a result of extensive p bonding with the p orbitals on the bridging oxygen atom. The high thermal motion is vibration of the atom into cavities in the structure. (10 refs.)

76379 Preparation and properties of the systems $\text{Fe}_{2-x}\text{Cr}_x\text{WO}_6$, $\text{Fe}_{2-x}\text{Rh}_x\text{WO}_6$, and $\text{Cr}_{2-x}\text{Rh}_x\text{WO}_6$. H. Leiva, R. Kershaw, K. Dwight, A. Wold (Dept. of Chem., Brown Univ., Providence, RI, USA). *J. Solid State Chem. (USA)*, vol.47, no.3, p.293-300 (May 1983). Solid solutions of the end members Fe_2WO_6 , Cr_2WO_6 , and Rh_2WO_6 have been prepared and their crystallographic and magnetic properties studied. All solid solutions crystallize with the trirutile structure, and their magnetic behavior is characterized by the existence of antiferromagnetic interactions and effective molar Curie constants corresponding to those expected from contributions of the spin only moments of high-spin Fe^{3+} , Cr^{3+} , and diamagnetic low-spin Rh^{3+} ions. Fe_2WO_6 crystallizes with the tri- α - PbO_2 structure and is antiferromagnetic and conducting. The random rutile Rh_2WO_6 is conducting, and the difference between its magnetic and electric properties and those of the inverse trirutile Cr_2WO_6 are discussed in terms of possible interactions between $\text{Cr}^{3+}(3d)$ or $\text{Rh}^{3+}(4d)$ orbitals and $\text{W}^{6+}(5d)$ orbitals. (17 refs.)

76380 Preparation and crystal structure of $\text{Na}_2\text{Mn}_2\text{S}_3$. K. Klepp, P. Bottcher, W. Bronger (Inst. für Anorganische Chem., RWTH Aachen, Aachen, Germany). *J. Solid State Chem. (USA)*, vol.47, no.3, p.301-6 (May 1983). $\text{Na}_2\text{Mn}_2\text{S}_3$ was prepared by reacting manganese powder with an excess of anhydrous sodium carbonate and elemental sulfur at 870K. Extraction of the solidified melt with water and alcohol yielded well developed, bright red crystals. $\text{Na}_2\text{Mn}_2\text{S}_3$ crystallizes with a new monoclinic structure type, space group $C2/c$, $Z=8$, with $a=14.942(2)\text{ Å}$, $b=13.276(2)\text{ Å}$, $c=6.851(2)\text{ Å}$, and $\beta=116.50(1)^\circ$. The crystal structure was determined from single crystal diffractometer data and refined to a conventional R value of 0.026 for 1613 observed reflections. The atomic arrangement shows sulfur-manganese-sulfur slabs which are separated from each other by corrugated layers of sodium atoms. A prominent feature of the crystal structure is the formation of short, four-membered zigzag chains built up by MnS_4 tetrahedra sharing edges. These chains are further connected by the remaining apices to form an infinite sheet. Short Mn-Mn distances (3.02 and 3.05 Å, respectively) are found within the four membered chains. Susceptibility measurements show antiferromagnetic interactions between the Mn atoms. (11 refs.)

76381 Preparation and structure of fluorite-type $(\text{Sr}_x\text{Y}_{1-x})\text{Cl}_{2.05}$. E. Mason, H.A. Fick (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA). *J. Solid State Chem. (USA)*, vol.47, no.3, p.314-21 (May 1983). Anion excess colorless fluorite-type strontium-yttrium chloride has been prepared. Single crystals of the Sr-Y compound exhibit a primitive cubic lattice with $a=6.967(1)\text{ Å}$. Two mutually exclusive structural models for solutions, neither of which is exact, are discussed. The first is a vacancy model in which the extra charge which results from substitution of Y^{3+} for Sr^{2+} is balanced by the simultaneous removal of a $\text{Sr}^{2+}\text{-Cl}^-$ ion pair. This model requires individual ion sites to be partially occupied and nonequivalent and is strongly suggestive of vacancy ordering. Refinement in space group $P1$, with sites refined independently, led to $R=0.1096$. The second model describes the structure in terms of a Willis cluster of defects and includes both anion vacancies and interstitial anions. Full-matrix least squares refinement in space group $Fm\bar{3}m$, with positions analogous to those in UO_2 and $(\text{Ca}_x\text{Y}_{1-x})\text{F}_{2.10}$, converged at $R=0.0633$ for the 114 face-centered parent structure reflections whose $|F|^2 > \sigma(F^2)$. This second model is discussed in relation to a probable true solution which involves long range order. (37 refs.)

76382 The oxysulfide anion $[\text{NbS}_2\text{O}]^{3-}$: synthesis and crystal structure of $\text{Ba}_2(\text{NbS}_2\text{O})(\text{NbS}_2\text{O})_3$. L.E. Rendon-Diazmirion (Inst. de Investigaciones en Materiales, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), C.F. Campana, H. Steinfink. *J. Solid State Chem. (USA)*, vol.47, no.3, p.322-7 (May 1983). The authors report on the preparation and crystal structure of $\text{Ba}_2(\text{NbS}_2\text{O})(\text{NbS}_2\text{O})_3$ using X-ray diffraction techniques. The structure was solved using the direct method which provided Ba and Nb positions. Three-dimensional electron density maps calculated from amplitudes phased with the heavy atoms revealed the S positions. The conventional R remained around 7%, the temperature factors for two S atoms were anomalously high, and bond lengths to Nb were very short. Replacing these atoms with oxygen permitted refinement of the data to a conventional R of 4.02% and $\omega R=4.19\%$ for the observed 1599 independent reflections. (21 refs.)

76383 A structure refinement of the high pressure modification Ba_2II . H.P. Beck (Inst. für Anorganische Chem., Erlangen, Erlangen, Germany). *J. Solid State Chem. (USA)*, vol.47, no.3, p.328-32 (May 1983). A high pressure phase Ba_2II , which can be quenched and retained as a metastable form at ambient conditions, is reported. The structure has been determined by X-ray investigations using single crystals. Ba_2II crystallizes in an anti- Fe_2P -type arrangement, space group $P6_2m$, $a=9.142(6)\text{ Å}$, $c=5.173(3)\text{ Å}$, which is slightly denser than the PbCl_2 -type structure found at normal pressure. Structural features of the two phases are discussed in comparison. (11 refs.)

76384 Aluminum distribution in the boron framework of $\gamma\text{-AlB}_{12}$. I. Higashi (Inst. of Phys. & Chem. Res., Saitama, Japan). *J. Solid State Chem. (USA)*, vol.47, no.3, p.333-49 (May 1983). The crystal structure of $\gamma\text{-AlB}_{12}$ ($P2_12_1$), $a=16.573(4)\text{ Å}$, $b=17.510(3)\text{ Å}$, $c=10.144(1)\text{ Å}$ was reinvestigated by single-crystal X-ray diffractometry and the nature of the metal distribution in the boron framework examined. Starting from the structure data published by Hughes et al. (1977), 458 independent parameters, including the occupancies of 11 Al sites, were finally refined to a conventional R value of 2.9%. A total of 5282 observed unique reflections ($\text{MoK}\alpha$ radiation; $2\theta < 64^\circ$) were used. Although distributed in an apparently complicated manner, the aluminum atoms occur in the boron framework according to a simple rule as in the crystals of the $\alpha\text{-AlB}_{12}$ structure type. The numbers of the valence electrons of Al, allotted to the six boron subunits, $\text{B}_{12}(\text{i-iv})$, $\text{B}_{20}(\text{C}_2\text{C}_3)$, proportionately to the contact frequencies of Al with the units, are 2.2, 1.9, 2.2, 1.9, 5.3, and 5.2, respectively. The charge assignment is compatible with the ionic formula $20/3\text{ Al}^{+2.4}\text{B}_{12}^{2-}\cdot 2\text{B}_{20}^{2-}$, proposed from preliminary molecular orbital calculations. A negative charge balance among the six boron units at about 1:1:1:1:3:3

seems to be essential for making up the stable boron framework of $\gamma\text{-AlB}_{12}$. (17 refs.)

76385 Structural aspect of a $\text{Zn}_{0.25}\text{Mn}_{0.12}\text{Fe}_{0.13}\text{S}_{0.5}$ crystal. Zhen-Chuan Kang (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA). *J. Microsc. & Spectrosc. Electron. (France)*, vol.8, no.1, p.19-24 (Feb. 1983). The structure and composition of a crystal of $\text{Zn}_{0.25}\text{Mn}_{0.12}\text{Fe}_{0.13}\text{S}_{0.5}$, found in a sample of the mineral frankite, have been determined by electron microscopy and microanalysis. It is a polytype of the form ...ABABABACACA... with composition in weight per cent determined by X-ray spectroscopy as 34.9 ± 0.1 Zn, 15.5 ± 0.1 Fe, 14.8 ± 0.1 Mn, 34.7 ± 0.1 S. (4 refs.)

76386 The crystal and molecular structure of dihydroxy (malonato)-diammine platinum (II). Li Genpei, Tang Youqi (Inst. of Phys. Chem., Peking Univ., Peking, China), Guan Yintong, Tang Wenxia, Dai Anbang. *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.2, p.200-5 (Feb. 1983).

A few platinum complexes having antitumor properties have attracted much interest in recent years. The authors have synthesized and tested the Pt(IV) malonato complex, which appears to exhibit significant activity on W-256 cancer. For this reason and in order to obtain more interesting information on the Pt(IV) malonato complex, they have determined the crystal and molecular structure. (10 refs.)

76387 Plane $[\text{Te}_6]^{4-}$ ions connected in chains in K_2SnTe_6 . B.Eisenmann, H.Schwerer, H.E.Schafer (Abteilung II für Anorganische Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany).

The new compound K_2SnTe_6 crystallizes in the tetragonal system (space group: 14cm , Nr.108) with $a=848.1(3)$ pm, $c=1536.9(7)$ pm, $c/a=1.812$, $z=4$. In the structure there are plane $[\text{Te}_6]^{4-}$ anions, which are connected to chains by tetrahedrally coordinated Sn-atoms. (3 refs.)

76388 Synthesis and crystal structure of the inter-alkali-metal chloride RbLiCl_2 . H.-C.Gaebell, G.Meyer, R.Hoppe (Inst. für Anorganische und Analytische Chem., Univ. Giessen, Giessen, Germany).

The crystal structure of RbLiCl_2 [$a=1441.3(3)$, $b=412.57(8)$, $c=720.9(1)$ pm, Guinier-Simon data, orthorhombic, Ccmn, No.63, $Z=4$] was determined and refined from single crystal data, with $R=0.074$, $R_w=0.062$. The coordination polyhedron of Rb^+ is a bicapped trigonal prism, since Li^+ is tetrahedrally coordinated. $[\text{LiCl}_4]^-$ tetrahedra are connected via common corners to undulated layers $\text{O}_2^-[\text{LiCl}_4]^-$ parallel to (100). The structure is closely related to that of SrZnO_3 . (16 refs.)

76389 $\text{Ti}_x\text{Ti}_6\text{Se}_8$ and $\text{Ti}_x\text{Nb}_6\text{Se}_8$, two phases with filled up Nb_3Te_4 type of structure showing pronounced cation disorder. H.Boller (Inst. für Phys. Chem., Univ. Wien, Wien, Austria), K.Klepp.

The new ternary chalcogenides $\text{Ti}_x\text{Ti}_6\text{Se}_8$ ($x=0.76$) and $\text{Ti}_x\text{Nb}_6\text{Se}_8$ ($x=0.70$) crystallize with a partially filled up Nb_3Te_4 structure: space group $P6_3/m$, $Z=1$ with $a=9.882(1)$, $c=3.590(1)$ Å ($\text{Ti}_{0.76}\text{Ti}_6\text{Se}_8$); $a=10.033(2)$, $c=3.475(1)$ Å ($\text{Ti}_{0.70}\text{Nb}_6\text{Se}_8$). The crystal structures were determined from single crystal diffractometer data and refined to conventional R-values of 0.077 and 0.055 respectively. The Ti atoms in the octahedral channels cannot be localized. In $\text{Ti}_x\text{Ti}_6\text{Se}_8$ diffuse scattering indicates one-dimensional short range order. A model of the cation distribution in $\text{Ti}_{0.76}\text{Ti}_6\text{Se}_8$ is discussed. (8 refs.)

76390 Refinement of the crystal structure of CeO_2Si_2 (ThCr $_2\text{Si}_2$ -type).

C.Horvath, P.Rogl (Inst. für Phys. Chem., Univ. Wien, Wien, Austria). *Mater. Res. Bull. (USA)*, vol.18, no.4, p.443-8 (April 1983). The crystal structure of CeO_2Si_2 has been determined from single crystal X-ray counter data. CeO_2Si_2 is tetragonal, $14/mmm$, $Z=2$; the cell parameters are $a=0.41617(5)$ and $c=0.98481(28)$ nm. The final reliability factor $R=\Sigma|\Delta F|/\Sigma|F_0|$ is 0.027 for 129 observed reflections ($|F_0|>2\sigma$). CeO_2Si_2 is isotypic with the ordered structure type of ThCr_2Si_2 (BaAl $_4$ -derivative type). (15 refs.)

76391 Lithium insertion into manganese spinels. M.M.Thackeray, W.I.F.David, P.G.Bruce, J.B.Goodenough (Inorganic Chem. Lab., Univ. of Oxford, Oxford, England).

Lithium has been inserted chemically and electrochemically into Mn_2O_4 and $[\text{LiMn}_2]\text{O}_4$ at room temperature. From X-ray diffraction, it is shown that the $[\text{Mn}_2]\text{O}_4$ subarray of the $\text{A}[\text{B}_2]\text{X}_4$ spinels remains unperturbed and that the electrons compensating for the Li^+ -ion charge reduce Mn^{3+} to Mn^{2+} in Mn_2O_4 and Mn^{3+} to Mn^{2+} in $[\text{LiMn}_2]\text{O}_4$. In $\text{Li}_x\text{Mn}_2\text{O}_4$, the tetragonal distortion due to a cooperative Jahn-Teller distortion by octahedral-site Mn^{3+} ions decreases with x from $c/a=1.157$ for $x=0$ to $c/a=1.054$ for $x=1$. The system $\text{Li}_{1+x}[\text{Mn}_2]\text{O}_4$ is cubic at $x=0$ and tetragonal ($c/a=1.161$) at $x=1.2$. Electrochemical data reveal a two-phase region in the $\text{Li}_{1+x}\text{Mn}_2\text{O}_4$ system and a maximum $x_m=1.25$. X-ray diffraction confirms the coexistence of a cubic and a tetragonal phase in the compositional range $0.1 \leq x \leq 0.8$. The X-ray data also show that the inserted Li^+ ions occupy the interstitial octahedral positions of the spinel structure. However, in $\text{Li}_x\text{Mn}_2\text{O}_4$ the tetrahedral-site Mn^{2+} ions are displaced from the A positions to the interstitial octahedral positions, as in $\text{Li}_x\text{Fe}_2\text{O}_4$, whereas the tetrahedral-site Li^+ ions in $[\text{LiMn}_2]\text{O}_4$ remain on the A sites. (7 refs.)

76392 Study of the structure and the conditions of stability of a new arsenide of iron: $\text{Fe}_{12}\text{As}_5$. S.Maaref, R.Madar (ENIG, Gabes, Tunisia).

The crystal structure determination of the new phase $\text{Fe}_{12}\text{As}_5$, like the isostructural phase $(\text{RuFe})_{12}\text{As}_5$, gives a rhombohedral cell with space group $R\bar{3}$. The metallic atoms are for one part inserted in square pyramidal and triangular bipyramidal sites and for the other part gathered in a metallic bipyramidal cluster. This description makes clear the relation between the structures of M_2X and M_3X phases. This new structural type appears as an intermediate case resulting from the increase of metallic interactions leading to the formation of metallic clusters. (8 refs.)

76393 Crystalline structure and magnetic properties of the low temperature variation of $\beta\text{-TiFeBr}_3$. N.Jouini, L.Guen, M.Tournoux (Lab. de Chimie des Solides, UER de Chimie, Nantes, France).

DTA and X-ray studies of TiFeBr_3 show a transition at 384°C . The low temperature phase $\beta\text{-TiFeBr}_3$ is related to NH_4CdCl_3 and crystallizes in the orthorhombic system with $a=9.279(4)$ Å, $b=3.984(3)$ Å, $c=15.070(7)$ Å, $Z=4$. The crystal structure has been determined from 564 independent reflections. The structure contains FeBr_6 octahedra in which each Fe atom is coordinated to six Br atoms. The FeBr_6 octahedra share vertices to form infinite double chains along the b axis. This compound behaves paramagnetically above 40K , with a Curie-Weiss temperature of $\theta=12\text{K}$ and a magnetic moment of $\mu=5.59 \mu_B$, but becomes antiferromagnetic below 14K . (22 refs.)

76394 A series of rare earth silicates $\text{RE}_2^{3+}\text{M}^{3+}[\text{SiO}_4]_2(\text{OH})$ [synthesis and crystal structure]. P.Bettermann, J.Lexow, F.Liebau, F.Seifert (Mineralogisches Inst., Univ. Kiel, Kiel, Germany).

A series of isotypic silicates of composition $\text{RE}_2\text{M}[\text{SiO}_4]_2(\text{OH})$ with $\text{RE}=\text{La}^{3+}$, Ce^{3+} , Pr^{3+} , Nd^{3+} , Sm^{3+} , Eu^{3+} , and $\text{M}=\text{Al}^{3+}$, Fe^{3+} has been synthesized under hydrothermal conditions. Lattice constants of two members as determined from single crystal X-ray diffraction data are: $\text{La}_2\text{Al}[\text{SiO}_4]_2(\text{OH})$ ($\text{La}_2\text{Fe}[\text{SiO}_4]_2(\text{OH})$) $a_0=7.401$ (7.346) Å, $b_0=5.702$ (5.862) Å, $c_0=17.072$ (17.196) Å, $\beta=112.4^\circ$ (112.5°), $P2_1/c$, $Z=4$. (10 refs.)

76395 Fluorinated compounds $\text{A}^{\text{I}}\text{BaM}_2^{\text{III}}\text{F}_9$ ($\text{A}^{\text{I}}=\text{Na}, \text{K}$; $\text{M}^{\text{III}}=\text{Ga}, \text{Cr}, \text{V}, \text{Fe}$). A.de Kozak, M.Samouel (Univ. Pierre et Marie Curie, Paris, France), M.Lebland, G.Ferey.

Rev. Chim. Miner. (France), vol.19, no.6, p.668-72 (1982). In French. Solid state synthesis, crystallochemical and magnetic investigations are presented of a new fluoride series of formula $\text{A}^{\text{I}}\text{BaM}_2^{\text{III}}\text{F}_9$, isotypical with monocline $\text{Ba}_2\text{CoFeF}_9$. (5 refs.)

76396 Crystal structure of $\text{Nd}_2\text{AlO}_3\text{N}$. Determination of the oxygen-nitrogen order by neutron diffraction. R.Marchand, R.Pastuszak, Y.Laurent, G.Roult.

Rev. Chim. Miner. (France), vol.19, no.6, p.684-9 (1982). In French. Oxynitride $\text{Nd}_2\text{AlO}_3\text{N}$ crystallizes in the tetragonal system with $a=3.7046(2)$ and $c=12.5301(13)$ Å. It possesses a structure which is related to the K_2NiF_6 type which can be described as a two-dimensional perovskite. The ordered arrangement between oxygen and nitrogen has been determined by time-of-flight neutron diffraction and profile analysis. This order leads to a loss of symmetry and the space group is 14mm . The aluminum atoms are at the centre of octahedra built up by five oxygen and one nitrogen. The two independent neodymium atoms have a coordination number of 9 but their environment is quite different. (7 refs.)

76397 Study of sodium-nitrogen bonds in the oxynitrides NaSiO and NaGeON with normal tetrahedral structure. J.Guyader, J.-M.Malhaire, Y.Laurent (UER, 'Structure et Propriétés de la Matière', Rennes, France).

Rev. Chim. Miner. (France), vol.19, no.6, p.701-6 (1982). By heating Na_2SiO_3 at $900-950^\circ\text{C}$ and Na_2GeO_3 at 750°C under an ammonia flow, two new oxynitrides NaSiON and NaGeON have been prepared. They are isotypic with LiSiON and possess a normal tetrahedral structure related to the wurtzite-type. The unit cells are orthorhombic with parameters $a=5.346$ (2), $b=7.186$ (3), $c=4.823$ (2) Å for NaSiON and $a=5.584$ (3), $b=7.403$ (3), $c=5.037$ (2) Å for NaGeON . The space group is $P2_1$. They are the first compounds showing tetrahedra $\text{Na}(\text{O}_3\text{N})$ with Na-N stable bonds. (9 refs.)

76398 Refinement of the crystal structures of two manganese silicates $\text{Na}_2\text{Mn}_2\text{Si}_2\text{O}_7$ and $\text{Na}_5(\text{Mn}, \text{Na})_3\text{MnSi}_2\text{O}_{18}$. L.P.Otoshchenko, V.I.Simonov, N.V.Belov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.511-13 (July 1982). Translation of: Dokl. Akad. Nauk SSSR, vol.265, no.1-3, p.76-9 (July 1982). [received: April 1983] The structures of two manganese silicates, $\text{Na}_2\text{Mn}_2\text{Si}_2\text{O}_7$ and $\text{Na}_5(\text{Mn}, \text{Na})_3\text{MnSi}_2\text{O}_{18}$ have been refined, using diffractometric data in the anisotropic approximation for the amplitudes of the thermal vibrations of the atoms, to discrepancy factors $R=6.1$ and 5.9% respectively, from 1319 to 1675 independent structure amplitudes. In the diorthosilicate $\text{Na}_2\text{Mn}_2\text{Si}_2\text{O}_7$ one of the basal Mn^{2+} cations was located in a fairly regular MnO_4 tetrahedron while the other was located in a trigonal MnO_3 bipyramid with a substantial scatter of Mn-O distances (2.05-2.46 Å). The metasilicate $\text{Na}_5(\text{Mn}, \text{Na})_3\text{MnSi}_2\text{O}_{18}$ is characterized by the fact that, along with purely Na and Mn polyhedra, polyhedra which are randomly occupied by Na^+ and Mn^{2+} cations jointly are also present in its structure. (11 refs.)

76399 Crystal structure of a new Na, Fe^{3+} orthophosphate $(\text{Fe}_9\text{O}_{15}[\text{H}_{1.5}\text{O}_{0.5}]\text{Na}_5[\text{PO}_4]_2=\text{Fe}_9\text{O}_{15}^{3+}\text{Na}_5[\text{PO}_4]_2\text{F}_{0.5}\text{SHF}$. O.V.Yakubovich, E.N.Matvienko, M.A.Simonov, N.V.Belov (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.516-18 (July 1982). Translation of: Dokl. Akad. Nauk SSSR, vol.265, no.1-3, p.83-8 (July 1982). [received: April 1983]

The unit-cell parameters were determined by the oscillating-crystal method (X-ray powder camera, Mo radiation). The trigonal symmetry of the crystals was established from X-ray goniometric scans of $h0k$ and $hk1$. The parameters of the trigonal cell were refined on a PI Syntex four-circle automatic diffractometer: $a=10.463(7)$ and $c=6.596(4)$ Å. The intensities of 1136 independent nonzero reflections ($I \geq 1.96\sigma$) were recorded by the $2\theta\theta$ method at a variable scanning rate of $6-24^\circ/\text{min}$ on the same diffractometer (MoK α radiation, $\max \sin \theta/\lambda=1.0 \text{ Å}^{-1}$). The absence of regular extinctions among the reflections points to the possible symmetry groups $P3$ and $P3_1$. (2 refs.)

76400 The cation distribution of tin-doped magnetites. E.Yu.Aksenova, E.L.Arinkina, Yu.A.Mamalyu.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.704-7 (May 1983). In Russian. The cation distribution of tin-doped magnetite has been studied by two independent methods: magnetic and crystallochemical. The Sn^{4+} ions are localized both in the octahedral and tetrahedral sites. Discrepancy of magnetic and crystallographic data can be explained by participation of Sn^{4+} ions in formation of the magnetic moment of ferrite. (6 refs.)

76401 The crystal structure of simonite, $\text{TiHfAs}_2\text{S}_6$. P.Engel, W.Nowacki (Lab. für Kristallographie, Univ. Bern, Bern, Switzerland), T.Balic-Zunic, S.Scavnicar.

Z. Kristallogr. (Germany), vol.161, no.3-4, p.159-66 (1982). The crystal structure of a new sulfosalt, $\text{TiHfAs}_2\text{S}_6$, has been determined. The crystal is monoclinic with space group $P2_1/\text{m}$. Four formula units are contained in a unit cell of dimensions $a_0=5.948(2)$ Å, $b_0=11.404(6)$ Å, $c_0=15.979(5)$ Å, $\beta=90.15(1)^\circ$. The structure was determined by direct methods and refined to a final R-value of 0.05 for 2462 observed reflections. The AsS_3 pyramids form infinite AsS_2 -chains parallel [101]. The Hg atom has a deformed octahedral coordination by 3+3S atoms. The octahedra form a double chain parallel to [100]. The Ti atom is coordinated by 7+2S atoms. The coordination polyhedra form layers parallel to (001). The mean Ti-S, Hg-S and As-S distances are 3.43, 2.86, 2.27 Å, respectively. (11 refs.)

76402 The distribution of Fe^{3+} and Ga^{3+} between octahedral and tetrahedral sites in garnets, $\text{Y}_3(\text{Fe}, \text{Ga})_5\text{O}_{12}$, at different temperatures. G.Amthauer, V.Gunzler, S.S.Hafner, D.Reinen (Univ. Marburg, Marburg, Germany).

Z. Kristallogr. (Germany), vol.161, no.3-4, p.167-86 (1982). The distribution of Fe^{3+} and Ga^{3+} between the octahedral and tetrahedral sites in two garnets with the compositions $\text{Y}_3\text{Fe}_4\text{GaO}_{12}$ and $\text{Y}_3\text{Fe}_3\text{Ga}_2\text{O}_{12}$ was studied after heating at temperatures between 1000°C and 1500°C using

Mossbauer and electronic absorption spectroscopy. Fe^{3+} shows preference for the octahedral sites and Ga^{3+} for the tetrahedral sites. At elevated temperatures, a more disordered distribution is observed. The standard Gibbs free energy change ΔG° per exchange pair according to the reaction $\text{Fe}^{2+}(\text{oct}) + \text{Ga}^{3+}(\text{tet}) \rightleftharpoons \text{Ga}^{2+}(\text{oct}) + \text{Fe}^{3+}(\text{tet})$ is 4.7–5.3 kcal and the enthalpy change ΔH° is of the same magnitude. ΔH° may be correlated with the d -electron site preference for the tetrahedral coordination, which is considerably larger for d^{10} than for d^2 configured cations. The rather slow kinetics of the cation exchange between octahedral and tetrahedral sites at temperatures below 1200°C is probably due to the corner-sharing topology of the coordination polyhedra. (24 refs.)

76403 Cation distributions in $(\text{Fe}_{1-x}\text{Me}_x)(\text{PO}_4)_2$ graftonite-type solid solutions determined by Mossbauer spectroscopy. A.G.Nord (Swedish Museum of Natural History, Stockholm, Sweden), T.Ericsson.
Z. Kristallogr. (Germany), vol.161, no.3-4, p.209-24 (1982). Solid solutions of $\text{Me}_2(\text{PO}_4)_2$ in $\text{Fe}_2(\text{PO}_4)_2$, with the graftonite-type structure, have been prepared and equilibrated at 1070K ($\text{Me} = \text{Mg}, \text{Ca}, \text{Co}, \text{Ni}, \text{Zn}, \text{or Cd}$). The $(\text{Fe}_{1-x}\text{Me}_x)_2(\text{PO}_4)_2$ phases are isomorphous with $\text{Fe}_2(\text{PO}_4)_2$, as well as with the mineral graftonite. Accurate unit cell dimensions ($P2_1/c$) have been obtained from Guinier-Hagg photographic data. The unit cell volume is strongly correlated with the amount and size of the incorporated Me^{2+} cation. Mossbauer spectroscopy (^{57}Fe) has been used to determine the cation distribution of Fe^{2+} and Me^{2+} between the three distinct cationic environments in the structure: one octahedron and two five-coordinated polyhedra, all distorted. (29 refs.)

76404 The crystal structure of $\text{Tl}_6\text{Cd}_3(\text{N}_3)_{14}$. H.Krischner, C.Kratky, H.E.Maier (Univ. Graz, Graz, Austria).
Z. Kristallogr. (Germany), vol.161, no.3-4, p.225-9 (1982). In German. $\text{Tl}_6\text{Cd}_3(\text{N}_3)_{14}$ was prepared by the reaction of aqueous solutions of cadmium azide with thallium azide. The lattice parameters are at 298K (100K): $a = 8.603$ (8.552), $b = 10.532$ (10.487), $c = 11.767$ (11.614) Å, $\alpha = 99.92$ (100.31), $\beta = 107.68$ (107.50), $\gamma = 113.51$ (113.47)°, space group $P1$, $Z = 1$. The crystal structure was determined by the Patterson method using 6198 independent low temperature MoK α diffractometer data and refined to $R = 0.087$. The structure consists of $\text{Cd}(\text{N}_3)_6$ -octahedra which share two nitrogen corners. The thallium ions are surrounded by eight azide groups. The azide groups are linear with N-N distances of 1.17(5) Å. (6 refs.)

76405 Crystal structure of synthetic $\text{K}_2\text{Mg}(\text{CO}_3)_2$. K.-F.Hesse, B.Simons (Mineralogisches Inst., Univ. Kiel, Kiel, Germany).
Z. Kristallogr. (Germany), vol.161, no.3-4, p.289-92 (1982). The structure of synthetic $\text{K}_2\text{Mg}(\text{CO}_3)_2$ is trigonal with space group $R\bar{3}m$, $a_0 = 5.150(1)$, $c_0 = 17.290(3)$ Å, $Z = 3$ and $D_x = 2.79$ g cm $^{-3}$, and was refined to R (unweighted) = 0.057 and R (weighted) = 0.036 using 280 non-equivalent reflections. The compound is isostructural with buetschelite, $\text{K}_2\text{Ca}(\text{CO}_3)_2$. The structure consists of isolated $[\text{CO}_3]_2$ polyhedra (C-O distance 1.283 Å), $[\text{MgO}_6]$ octahedra (Mg-O distance 2.093 Å) and $[\text{KO}_6]$ polyhedra (K-O mean distance 2.801 Å). The $[\text{CO}_3]_2$ group is non-planar and the distance of the carbon atom from the plane of the three oxygen atoms is 0.014(3) Å. (19 refs.)

76406 The crystal structure of $\text{KCd}(\text{N}_3)_3 \cdot \text{H}_2\text{O}$ and $\text{K}_2\text{Cd}(\text{N}_3)_4$. W.Clegg (Inst. fur Anorganische Chem., Univ. Gottingen, Gottingen, Germany), H.Krischner, A.I.Saracoglu, G.M.Sheldrick.
Z. Kristallogr. (Germany), vol.161, no.3-4, p.307-13 (1982). $\text{KCd}(\text{N}_3)_3 \cdot \text{H}_2\text{O}$ crystallizes in space group $Pnma$ with $a = 11.991(2)$, $b = 3.712(1)$, $c = 17.292(2)$ Å and $Z = 4$. $\text{K}_2\text{Cd}(\text{N}_3)_4$ crystallizes in space group $C2/m$ with $a = 14.272(2)$, $b = 3.787(1)$, $c = 8.887(2)$, $\beta = 92.83(2)^\circ$ and $Z = 2$. The structures have been determined from single crystal X-ray data. The final R -values are 0.074 and 0.063 respectively. In both structures cadmium is surrounded octahedrally by six azide groups; the $\text{Cd}(\text{N}_3)_6$ -octahedra share edges. Potassium is coordinated by seven azide groups and two water molecules in $\text{KCd}(\text{N}_3)_3 \cdot \text{H}_2\text{O}$ and by eight azide groups in $\text{K}_2\text{Cd}(\text{N}_3)_4$. In both structures all azide groups are approximately parallel, with mean N-N = 1.17(5) Å. (9 refs.)

76407 Standard X-ray diffraction powder patterns. Section 19 - Data for 51 substances. M.C.Morris, H.F.McMurdie, E.H.Evans, B.Paretzkin, H.S.Parker, N.P.Pyrrors, C.R.Hubbard.
Report NBS-MN-25-19, Nat. Bur. Stand., Washington, DC, USA (Dec. 1982), iv + 114 pp.
The standard X-ray powder diffraction patterns, useful for identification, were obtained by manual or automated diffractometer methods, or were calculated from published crystal structure data. The lattice constants from the experimental work were refined by least-squares methods, and reflections were assigned Miller indices consistent with space group extinctions. Relative intensities, calculated densities, literature references, and other relevant data are included.

76408 Modeling the phase change in crystalline biphenyl by using a temperature-dependent potential. W.R.Busing (Chem. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.3, p.340-7 (1 May 1983).

The structures of two crystalline phases of biphenyl ($\text{C}_{12}\text{H}_{10}$) were modeled using an exp-6-1 nonbonded potential and $(1 - \cos^2 \phi)$ terms for the phenyl-phenyl conjugation energy. Preliminary calculations were made by minimizing the energy of a model starting from the 110K structure, space group $P2_1/a$, with planar molecules. Doubling the b axis and relaxing all symmetry caused the model to transform to a structure with twisted molecules, space group Pn , essentially the same as the approximate structure reported from neutron diffraction studies at 22K. Increasing the contribution of the conjugation energy reversed the transformation, and calculations show that the potential that produces planar molecules in the crystal predicts twisted molecules in the gas phase, in agreement with experiment. A new temperature-dependent potential is described in which the nonbonded terms are modified according to the thermal motions of the atoms involved. Ways of combining the motions of the two atoms involved are considered. This new potential was applied to biphenyl to calculate successfully the observed unit-cell volumes and thermal expansion. The model reproduces the torsion angles in the 22K structure, and increasing temperature produces the experimental phase change, although the predicted transition temperature is higher than that observed. (41 refs.)

76409 Preliminary X-ray study of heratomin and Hg-derivative of geraniol. D.Rauth, K.N.Goswami (Dept. of Phys., Univ. of Jammu, Jammu, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.184 (March 1983).

The unit cell and space group of heratomin and the Hg-derivative of geraniol have been determined by X-ray diffraction. The compounds are monoclinic with space groups $P2_1/m$ and $P2_1/c$ respectively. (2 refs.)

76410 The theoretical shape of sucrose crystals from energy calculations. M.Saska, A.S.Myrson (School of Chem. Engng., Georgia Inst. of Technol., Atlanta, GA, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.546-55 (April-May 1983).

The surface energies of individual crystallographic faces of crystalline sucrose were calculated using two forms of the 6-exp (Buckingham) potential. Hydrogen bond energies were calculated as a sum of O-H, O...H and O...O interactions where the Lippincott-Schroeder short-range potential was used for O-H and O...H pairs and the 6-exp potential for the non-bonded O...O interactions. Assuming that the surface energy equals half of the cohesive energy of the crystal, the attachment and surface energies of most of the faces found on as sucrose crystal were calculated. A computer program was written to draw the theoretical shape of crystals given the positions (central distances) of its faces. The resulting sucrose shapes are elongated along the c -axis. It is argued that the c -axis elongated habit is an intrinsic shape for vapor grown sucrose crystals (if realizable) and it is suggested that the usual shapes of solution growth sucrose crystals can be explained in terms of solvent (water) adsorption. (18 refs.)

76411 Crystal structure of N -m-tolyl phthalimide. K.Chandrasekhar, V.Pattabhi, S.Swaminathan (Dept. of Crystallography & Biophys., Univ. of Madras, Madras, India).

Pramana (India), vol.20, no.1, p.19-22 (Jan. 1983). [received: May 1983]
 N -m-tolyl phthalimide, $\text{C}_{15}\text{H}_9\text{NO}_2$, crystallizes in the space group Cc with unit cell dimensions, $a = 8.54(1)$, $b = 19.89(2)$, $c = 7.59(1)$ Å, $\beta = 114.53(1)^\circ$ and $Z = 4$. $V_c = 1173(2)$ Å 3 , $D_m = 1.35(1)$, $D_c = 1.344$ mg.m $^{-3}$, $M_r = 237$ Å CoK α = 1.7903 Å. The structure was solved by MULTAN and refined to an R -factor of 0.116 for 632 counter reflections. The molecules are held together by van der Waal's forces. The angle between the tolyl plane and the plane through the phthalimide group is $53.4(4)^\circ$. (11 refs.)

76412 Crystal structure of triphenylantimony dibenzoate, $\text{C}_{39}\text{H}_{27}\text{O}_4\text{Sb}$. V.A.Lbedev, R.I.Bochkova, L.F.Kuzubova, E.A.Kuz'min, V.V.Sharutin, N.V.Belov (Physicotech. Res. Inst., N.I. Lobachevskii State Univ., Gorki, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.519-21 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.332-5 (July 1982). [received: April 1983]

Crystals of triphenylantimony dibenzoate were subjected to a comprehensive X-ray structure analysis. The specimen chosen for the investigations was a transparent, slightly yellowish, rectangular plate measuring $0.46 \times 0.32 \times 0.28$ mm. The unit cell was rhombic with $a = 15.834(7)$, $b = 19.584(1)$, $c = 16.827(7)$ Å. (4 refs.)

76413 The onset temperature for void formation in extremely pure iron. L.de Schepper, G.Knuyt, L.M.Stals, P.Moser (Limburgs Univ. Centrum, Diepenbeek, Belgium).

Radiat. Eff. Lett. Sect. (GB), vol.76, no.1-2, p.43-54 (1983).

The onset temperature for void formation in extremely pure iron is measured in a simulation study by 1 MeV electron microscopy. It is found to be between 430 and 470K; this is substantially lower than reported earlier in the literature. It is shown that the observed onset temperature is consistent with vacancy migration in stage III (200-220K) in α -iron, provided that the interaction between interstitial carbon atoms and vacancies is taken into account. (29 refs.)

76414 A high-resolution electron microscopic study of defects in sodium β'' -alumina. R.Hull (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England), D.J.Smith, C.J.Humphreys. *J. Microsc. (GB)*, vol.130, pt.2, p.203-14 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). A high-resolution electron-microscopic study of sodium β'' -alumina, a polytype of the more-widely-studied sodium β - and β' -alumina, has been undertaken using the 600 kV instrument at Cambridge University. Images revealed the loss of sodium-containing planes, which had caused crystals to collapse and shear into defect layers. A model for the structure of these defects is proposed, based on the use of computed images and by comparison with high-resolution images of silver β'' -alumina. (18 refs.)

76415 A determination of vacancy properties in Au-Ni solid solutions, via analysis of stress-induced and short range ordering kinetics. E.Balanat, M.Halbwachs, J.Hillairet, C.Mairy (Dept. de Recherche Fondamentale, CENG, Grenoble, France), P.Guyot, J.P.Simon. *Acta Metall. (USA)*, vol.31, no.6, p.883-92 (June 1983).

Vacancy properties were studied in an α -Au-30 at.% Ni solid solution, with use of electrical resistivity and mechanical after-effect measurements, for the monitoring or short-range and stress-induced ordering kinetics, respectively. It is shown that, due to the inherent sensitivity of the methods used, valuable information about the vacancy parameters and related atomic mobility can be inferred from analysis of the ordering rate at low temperatures, that is in conditions of non-equilibrium for the α -phase. The respective activation energies for self-diffusion, and vacancy migration which were derived from the rate temperature dependence are 1.85 and 1.10 eV, respectively. These values yield a consistent fit to the ordering pattern observed during quench and isochronal anneal cycles. Information about vacancy sink densities and lifetimes were inferred also. The salient feature of the results is that, while the atom jump rate is not substantially modified by alloying, vacancy mobility is markedly slowed down; conversely the vacancy formation energy appears to be strongly decreased. A Au-5 at.% Ni alloy for which the α -phase is stable at all temperatures was studied also. (23 refs.)

76416 On the nature of point defects and the effect of oxidation on substitutional dopant diffusion in silicon. T.Y.Tan, U.Gosele, F.F.Morehead (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Appl. Phys. A (Germany), vol.A31, no.2, p.97-108 (June 1983). An extensive analysis of the substitutional dopant diffusion phenomena in silicon during oxidation is presented. The analysis covers qualitative as well as quantitative aspects of the oxidation-enhanced and -retarded diffusion (OED and ORD) phenomena, and examines three different possible assumptions that can be made on the nature of the silicon thermal equilibrium point defect species: silicon self-interstitials (I) only, vacancies (V) only, coexistence of I and V. The only consistent way to interpret all properly documented OED/ORD data is to assume that I and V coexist under oxidation as well as under thermal equilibrium conditions at high temperatures. (58 refs.)

76417 Boundary conditions in computer simulations of point defects. H.R.Schober (Inst. für Festkörperforschung KFA, Jülich, Jülich, Germany). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.1-2, p.19-24 (1983). In computer simulations of metals, volume dependent contributions to the energy are often introduced. It is shown how such volume terms affect calculations with different boundary conditions. (10 refs.)

76418 Theory of annealing of vacancy pores in thin metal foils. N.A.Demin, Yu.V.Konobeev.

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.701-6 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A theoretical analysis is made of the influence of free surfaces on the kinetics of isothermal annealing of vacancy pores in a thin metal foil. It is shown that in the case of pores located close to the surface the rate of dissolution may be considerably higher than for isolated pores in the bulk of a metal. (6 refs.) A.T.

76419 Some physical properties and point defects in $\text{Bi}_{2-x}\text{In}_x\text{Te}_3$ mixed crystals. P.Lostak, J.Horak, L.Koudelka (Univ. of Chem. Technol., Pardubice, Czechoslovakia).

Phys. Status Solidi A (Germany), vol.76, no.1, p.K71-5 (16 March 1983). The authors report for the first time the preparation of single crystals of $\text{Bi}_{2-x}\text{In}_x\text{Te}_3$ ($x=0$ to 0.04) and the results of a study of their optical parameters (transmission and the index of refraction) which they have correlated with some transport parameters of the crystals (electric conductivity and Hall coefficient). From the analysis of the physical parameters they have evaluated point defects formed in the mixed crystals due to the incorporation of indium atoms into the Bi_2Te_3 crystal lattice. (9 refs.)

76420 Point defects in II-VI compounds. T.Taguchi, B.Ray (Faculty of Engng., Osaka Univ., Osaka, Japan).

Prog. Cryst. Growth & Charact. (GB), vol.6, no.2, p.103-62 (1983). An extensive survey is made of recent developments in the study and characterisation of lattice defects in II-VI compounds, including both point defects and complex-defect centres. Point defect generation during crystal growth and by bombardment of crystals with high energy electrons or light ions is considered in detail and the different vacancy and interstitial atomic configurations are elucidated. The formation and character of complex-defect centres are examined and linked to the low temperature photoluminescent emission spectra observed in these materials. The stability at room temperature of both isolated and other centres associated with vacancies is discussed in relation to lattice distortions and energy levels in the forbidden energy gap. The application of Rutherford backscattering, deep-level-transient spectroscopic and photo-acoustic spectroscopic techniques is shown to have advanced the understanding of lattice defects in II-VI compounds. Some possible future developments in defect studies are identified and of them the use of particular lower temperature, crystal growth techniques is seen as an important early step in reducing intrinsic defect levels. (195 refs.)

76421 Mechanism of electron-excitation-induced defect creation in alkali halides. N.Itoh (Dept. of Crystalline Material Sci., Nagoya Univ., Nagoya, Japan).

Radiat. Eff. (GB), vol.64, no.1-4, p.161-9 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Mechanisms of the defect creation in alkali halides induced by electronic excitation, suggested within these three decades, are surveyed, emphasizing how they are related to the overall yield of defect creation in solids. The experimental and theoretical studies which are critical check points for proposed mechanisms are discussed in detail. It is pointed out that the processes of localization of the wave functions of the electrons and holes and the conversion of localized electronic energy to the motion of the lattice atoms should be understood. The mechanisms of the dynamic motion of atoms to which the electronic energy is imparted and of the stabilization of the primary products, the neutral interstitials and vacancies in the halogen sublattice, are also discussed. 61.70D Colour centres

76422 Neutron induced colour and luminescence centres in yttrium-aluminium garnet single crystals. A.F.Rakov (Inst. of Nuclear Phys., Acad. of Sci., Tashkent, Uzbek SSR).

Phys. Status Solidi A (Germany), vol.76, no.1, p.K57-60 (16 March 1983). The nature of colour (CC) and luminescence (LC) centres occurring in yttrium-aluminium garnet (YAG) crystals is discussed on the basis of optical absorption (OA) and photoluminescence (PL) spectra. YAG crystals, grown by Czochralski and horizontal directed crystallization methods, were examined. The samples have been irradiated by neutrons of energy $E>0.2$ MeV, creating defect structures in crystals. The neutron doses were 10^{16} to 10^{19} n/cm². (7 refs.)

76423 On production of Z_1 centres in NaCl:Sm^{2+} crystals. K.N.Reddy, M.D.Iqbal Ahmed (Dept. of Phys., Osmania Univ., Secunderabad, India), V.H.Babu.

Phys. Status Solidi a (Germany), vol.76, no.2, p.K167-70 (16 April 1983). The authors study the formation of Z_1 centres in NaCl:Sm^{2+} crystals and the effect of deformation on Z_1 centres with the help of optical absorption and thermoluminescence (TL) measurements. The results lead to the conclusion that a small concentration of Z_1 centres is formed during irradiation without optical bleaching, confirming the earlier optical absorption work of Marat-Mendes and Comins (1975). TL measurements suggest that the concentration of Z_1 centres is greatly increased by deformation as previously noted by Radhakrishna and Chowdary (1972) and Kamavisdar and Deshmukh (1981). (6 refs.)

76424 On the nature, characterisation and applications of point defects in insulators. B.Henderson (Phys. Lab., Trinity Coll., Dublin, Ireland). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.35-47 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Outlines some basic properties of defects in insulators and describes experimental techniques by which these defects may be characterized. The production of defects by various types of particle irradiation is discussed. Finally, some discussion is presented of the potential device application of defective crystals, including tunable colour centre lasers, miniaturised optical circuitry and neuron dosimetry. (25 refs.)

76425 Theory of strongly relaxed point defects in oxides. W.B.Fowler (Dept. of Phys., Lehigh Univ., Bethlehem, PA, USA). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.63-9 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Experimental and theoretical efforts during recent years have led to structural models for several of the fundamental point defects in oxide materials. In many of these cases it has become apparent that asymmetric relaxations of neighboring atoms play a key role in the detailed structure and properties of these defects. Such effects are not as common in prototype insulators such as alkali halides (a notable exception being the Type II F_A center). Strong relaxations in a number of oxides have been treated theoretically by Schirmer using a 'bound small polaron model'. Similar ideas had been incorporated into a treatment of the E'_1 center in SiO_2 by Yip and Fowler (1975), and more recently by Griscom and Fowler (1980). Extensive computations on the E'_1 , E'_2 , and peroxy-radical centers using MNDO and MINDO/3 quantum-chemistry approaches indicate that the defect geometries and properties are strongly related to atomic relaxations about them. It is likely that these effects are important in other insulating materials as well. (44 refs.)

61.70G Dislocations: theory

76426 The temperature dependence of the line tensions of dislocations in several b.c.c. metals. H.G.Schmid (Max-Planck-Inst. für Metall., Inst. für Werkstoffwissenschaften, Stuttgart, Germany).

Mater. Sci. & Eng. (Switzerland), vol.59, no.1, p.L7-9 (May 1983). The line tensions of dislocations in molybdenum, niobium, tantalum and $\alpha\text{-Fe}$ have been computed as a function of temperature over ranges of several hundred kelvins, using published data on the elastic constants and their dependence on temperature. (14 refs.)

76427 Low-temperature fluctuational motion of dislocations in crystals. I. Quantum and dissipative effects. A.I.Osetskii (Inst. for Problem of Cryobiology & Cryomedicine, Acad. of Sci., Kharkov, Ukrainian SSR).

Phys. Status Solidi b (Germany), vol.117, no.1, p.355-65 (1 May 1983). A mechanism underlying fluctuational bending of dislocation segments is considered which is based on periodical ordering in the thermal motion of atoms near the dislocation core. Basic principles of calculating the probability of dislocation unpinning from local obstacles due to the fluctuations are formulated. As found, the interaction of dislocation segments experiencing fluctuational bending with phonons and/or conduction electrons, described in the framework of the usual dissipation model, can result in a reduction of the energy of atoms near the dislocation core during the fluctuation. Consequently, the effective activation energy of the dislocation unpinning from local obstacles is increased, i.e. the mean velocity of the activated dislocation motion drops. Activated dislocation motion at low temperatures is analysed with an account of the possible quantum mechanical fluctuations which can arise in condensed structures owing to the correlation of atomic zero point vibrations. An expression is derived for the probability of low temperature fluctuational dislocation with allowance for quantum mechanical effects. (11 refs.)

76428 Analytical calculation of parameters of thermally activated dislocation motion through a random array of point obstacles. A.I.Landau (Phys. Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.207-16 (16 March 1983). A method is proposed which enables the calculation of the velocity of the thermally activated dislocation motion through a random array of similar-type point obstacles, based entirely on analytical relations, without recourse to computer simulation. The method enables also the calculation of the probability densities of attack angles and dislocation segment lengths which describe the probability-geometric characteristics of a dislocation in the physical system. (23 refs.)

76429 The effect of the crystal anisotropy on the energy of the dislocation-impurity atmosphere elastic interaction in silicon. G.N.Gaidukov, S.K.Maksimov, A.A.Podrezov (Inst. of Electronic Technol., Moscow, USSR). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.453-9 (16 April 1983). The energy of the system: straight dislocation-impurity atmosphere, is investigated within the framework of the linear anisotropic theory of elasticity. A

numerical calculation is performed for the edge dislocations oriented along the directions (110) and (112), with the Burgers vectors $1/2(110)$ and $1/3(111)$, and for impurity atoms presented as point spherical defects in Si. It is shown that for certain impurity concentrations separating the domains where the preferable orientation of the dislocation line is along the direction (112) L , from that where the preferable direction is (110). (13 refs.)

76430 Dynamic dislocation pile-ups. H.Ockendon (Somerville Coll., Oxford Univ., Oxford, England).

Philos. Mag. A (GB), vol.47, no.5, p.707-19 (May 1983). The motion of a continuous distribution of dislocations moving under a constant imposed stress towards a small locked dislocation is considered. This problem can be modelled as a non-linear partial differential equation for a complex stress function if a linear-stress-velocity law is assumed. If the initial density of the distribution is sufficiently small, the dynamic pile-up that occurs can be described using matched asymptotic expansions. In particular, the force on the locked dislocation is derived as a function of time. It is further shown that the solution remains valid when the velocity is proportional to any positive power of the stress. (5 refs.)

76431 Model of formation of lined-up-dipole slip bands with a predominant screw component. V.G.Kurdyumov (Inst. of High-Pressure Phys., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.650-2 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1382-5 (Aug. 1982). [received: May 1983]

Proposes a model of longitudinal development of a slip band of the lined-up-dipole type. The main idea of the model is the hypothesis that loops are nucleated successively under the action of stresses, at the end of a lined-up-dipole configuration of screw dislocations. (6 refs.)

76432 Computer simulation of an edge dislocation in a naphthalene crystal. N.N.Mokichev, L.G.Pakhomov (Sci.-Res. Inst. of Chem., Lobachevski State Univ., Gorki, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1925-7 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3389-93 (Nov. 1982). [received: May 1983]

The equilibrium configuration is found for the core of a [010] (001) edge dislocation in a naphthalene crystal. The change in the binding energy of molecules in the core is determined, relative to a perfect crystal; the radius and elastic energy of the core are estimated. The change in the polarization energy of the crystal due to a free carrier in the core is determined. The range of action of a dislocation as regards the electron and hole conduction levels is found. 61.70J Etch pits, decoration, transmission electron-microscopy and other direct observations of dislocations

76433 Generation of dislocations introduced by bending stress in a Si wafer. R.Sawada, T.Karaki, J.Watanabe (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Musashino, Tokyo, Japan).

Appl. Phys. A (Germany), vol.A31, no.2, p.109-14 (June 1983). Distribution and morphology for dislocations introduced in (001) Si wafers subjected to bending stress at 800°, 900°, and 1100°C were investigated. For wafers bent around a [110] axis at 900° and 1100°C, straight dislocations appeared along the [110] direction only near the neutral plane, and were absent at the surfaces where bending stress is greatest. However, for wafers bent at 800°C, such straight dislocations were not formed. Dependence of the dislocation distribution and morphology on heat treatment temperature is explained on the basis of interaction between bending stress and SiO_2 precipitates introduced in bulk. Also, it was found that the straight [110] dislocations remained still near the neutral plane, even when additional reverse bending stress was applied around an axis parallel to the dislocations, but were transferred toward the tensile surface by bending around an axis normal to the dislocation direction. (24 refs.)

76434 Evaluation of misfit dislocations in planar, zinc-diffused $\text{In}_{0.53}\text{Ga}_{0.47}\text{As}$ PIN photodiodes. A.K.Chin, B.V.Dutt, W.S.Trimmer, J.R.Zuber, T.Boone, K.D.Trapp (Bell Labs., Murray Hill, NJ, USA).

Mater. Lett. (Netherlands), vol.1, no.5-6, p.152-6 (April 1983). Misfit dislocations in planar, zinc-diffused $\text{In}_{0.53}\text{Ga}_{0.47}\text{As}$ PIN photodiodes were analyzed using defect etching, cathodoluminescence, and electron-beam-induced current (EBIC). It was found that the misfit dislocations in wafers grown by liquid-phase epitaxy are present only in the InP buffer layer and they act as nonradiative recombination centers. These dislocations also affect the p-n junction since the misfit stress locally increases the diffusion depth by 80-400 Å. EBIC examination of the photodiodes under reverse bias shows that the misfit dislocations do not cause localized breakdown of the p-n junction. (26 refs.)

76435 X-ray investigation of crystal defects in Czochralski grown InP single crystals. P.Franzosi (Istituto MASPEC, Parma, Italy), C.Ghezzi.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.591-600 (April-May 1983). X-ray diffraction topography was employed to study extended crystal defects in InP single crystals grown by the Czochralski liquid-encapsulation technique. Semi-insulating iron-doped, p-type and n-type crystals were investigated and two main defects, dislocation lines and large precipitate-like defects, were evidenced. The generation mechanism for the dislocations and the nature of the large defects were analyzed. (26 refs.)

76436 Characterization of defects in InP substrates. D.J.Stirland, D.G.Hart, S.Clark (Allen Clark Res. Centre, Plessey Res. (Caswell), Caswell Ltd., England), J.C.Regnaud, C.R.Elliott.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.645-57 (April-May 1983). Unusual inclusion-like defects (grappes) which occur in many LEC InP ingots have been studied in an [001] Ge-doped wafer by optical microscopy of the etched wafer surface, reflection and transmission X-ray topography, and transmission polarised infra-red microscopy. The defects produced a variety of different contrast features on reflection X-ray topographs. By using all the techniques in combination to examine individual defects it was deduced that the observed contrast effects were consistent with previous postulates regarding the structures of these defects. Essentially, all the defects are similar in structure but vary in diameter from 5-200 μm , and consist of central core

regions surrounded by prismatic dislocation loop arrays. It was also established that the majority of defects are situated on line dislocations, and they possess effective Burgers vectors which differ from those of the dislocations on which they are located. (17 refs.)

76437 Interstitial loop growth in HVEM-irradiated nickel foils. K.M.Miller (Berkeley Nuclear Labs., CEBG, Berkeley, England). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.216-22 (April 1983). A recently presented model (see *ibid.*, vol.110, p.265, 1982) for the development of a dislocation density in HVEM-irradiated thin foils has been applied to nickel. From matching the results to previously reported experimental measurements of loop radius growth as a function of position in the foil, the dislocation bias and vacancy migration energy in nickel have been determined. A comparison has been carried out of the effect on the results of using two distinct sink strengths to model the flow of defects to the dislocation loops. Equally good fits to the experimental data have been obtained with either sink strength and consequently it has not proved possible to select a preferable representation for the loops. (8 refs.)

76438 First observations of defects in α -gallium at room temperature. N.Durbec, B.Pichaud, F.Minari (Lab. de Phys. Cristalline, Univ. Aix-Marseille III, Marseille, France). *J. Microsc. & Spectrosc. Electron. (France)*, vol.8, no.1, p.47-52 (Feb. 1983). The authors have been able to examine some crystals of gallium near the melting point by TEM. They show that good images can be obtained but indexing the diffraction patterns offers some difficulties, because several sections of the reciprocal lattice are almost identical. This study allows some previous results (obtained by X-ray transmission topography) about dislocations in Ga to be checked and reveals the existence of stacking faults. Furthermore, at such temperatures, one can observe the climbing of these defects. (6 refs.)

76439 The effect of annealing on the dislocation dissociation in plastically deformed silicon. V.V.Aristov, M.N.Zolotukhin, V.V.Kveder, Yu.A.Osipyan, I.I.Snighireva, I.I.Khodov (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.485-91 (16 April 1983). The dissociation of dislocations in deformed and annealed silicon samples is studied using the weak beam method of electron microscopy. It is shown that the annealing of samples may result in a significant decrease of the dissociation widths of dislocations with a predominant screw component. In samples deformed without annealing a major portion of such dislocations is split anomalously widely as compared to those with a predominant edge component, whereas after annealing the dissociation widths of dislocations of all orientations agree with the theoretical dependence. A possible relationship between the change in the dislocation dissociation after annealing and the behaviour of the EPR signal from dislocations is discussed. (25 refs.)

76440 Transmission electron microscopy of dislocation structures in V_3Si single crystals after deformation at high temperatures. U.Kramer (Sektion Phys., Tech. Univ. Dresden, Dresden, Germany). *Philos. Mag. A (GB)*, vol.47, no.5, p.721-40 (May 1983). The plastic deformation of the intermetallic compound V_3Si at 1280 to 1500°C takes place by gliding and climbing of dislocations. The Burgers vector of single dislocations is (100). Occasionally a dislocation with Burgers vector (110) is observed in nodes. The slip plane of indirectly heated samples is {001}. Straight dislocations preferentially run along (100) and (110) directions. The absence of screw dislocations is explained by their higher mobility compared with edge and 45° dislocations and the presence of two slip planes for each screw dislocation. Sub-grain boundaries in deformed crystals are mostly formed by two sets of dislocations with different Burgers vectors of type (100). During dynamic recovery, elongated prismatic dislocation loops are generated in (100) directions. (26 refs.)

76441 Optical damping of dislocations in KCl crystals. M.A.Golosovskii, Ya.M.Soifer (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1890-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3327-32 (Nov. 1982). [received: May 1983] A study was made of the influence of the F light on the dislocation damping of ultrasound (optical damping of dislocations) and on the dislocation charge of additively colored and γ -irradiated KCl crystals of different purity. It was found that optical damping of dislocations occurred in all the investigated crystals and this was due to the appearance of new pinning points under the influence of light. The conditions of formation of such pinning points depended on the dislocation charge, purity of a crystal, and the method of introduction of the F centers. An analysis was made of binary systems in which the phenomenon of optical damping of dislocations could be observed. (5 refs.)

76442 Temperature dependence of the resistance to motion of edge dislocations in Fe-Co solid solutions. E.F.Dudarev, V.V.Rudchenko, V.A.Brovkov (V.D. Kuznetsov Siberian Physicotech. Sci.-Res. Inst., State Univ., Tomsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.811-13 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* An investigation was made of the composition and temperature dependences of the stress at which dislocations began to overcome the drag caused by substitutional and interstitial atoms. This was done for Fe-Co solid solutions with different amounts of interstitial impurities in order to determine the influence of cobalt and of these impurities on the resistance to motion of edge dislocations. The stress in question was deduced from the amplitude dependences of the internal friction of the investigated solid solutions. The results indicated that atoms of the alloying element and the interstitial impurity atoms contributed to the resistance to the motion of edge dislocations. (8 refs.) A.T.

76443 Stress relaxation experiments for proving the existence of an obstacle spectrum for thermally activated dislocation motion. F.Appel, U.Messerschmidt (Inst. of Solid State Phys. & Electron Microscopy, Acad. of Sci., Halle/Saale, Germany), Yu.Z.Estrin. *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.41-7 (May 1983). The decrease in the activation volume of thermally activated dislocation motion observed in a constant-strain-rate test is often attributed to the generation of additional short-range obstacles in the deformation process. The alternative explanation is that the dislocation velocity increases with increase in strain if the structure of the short-range obstacles is constant. The activation volume is then decreased by a related decrease in the activation distance. By means of the stress relaxation tests at attempt was made to decide between these two possibilities by comparing the interaction potential of the short-range defects present at small strains with that at large strains. The investigations were performed on calcium-doped NaCl crystals. The results suggest that new short-range obstacles are produced during the deformation in addition to the impurity defects present in the undeformed material. (25 refs.)

76444 Low-temperature dislocation pinning and breakaway observed in Ta containing H. H.Mizubayashi, T.Arai, S.Okuda (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.165-77 (16 March 1983). Internal friction (IF) and modulus below 100K in high purity Ta polycrystalline specimens containing very low concentration of H (RRR=2600 to 5000, $C_H \approx 8$ to 20 at. ppm) are studied after various treatments, i.e. quenching into liquid He, high amplitude vibration ($\epsilon_s \approx 2$ to 5×10^{-5}) at 5K (HAV(5K)) and the slow cool-down with or without vibration at low amplitude ($\epsilon_s \approx 2 \times 10^{-6}$) (the ON- or OFF-cool-down). During warm-up after the OFF-cool-down from $\approx 60K$, an anomalous softening is observed to occur below 60K, but during the ON-cool-down from $\approx 60K$, this decreased modulus is almost remained but not recovered. This observation is reproducible repeatedly. Detailed observations suggest that there are at least two types of H pinners in this temperature range; the one is responsible for an appearance of the anomalous softening through the breakaway of dislocations from them, the weak H pinners and the other, responsible for the remaining part of the pinning, the strong H pinners. (12 refs.)

76445 X-ray topographic in-situ observation of slip band propagation in MgO single crystals. U.Messerschmidt, Y.Nishino, T.Imura, H.Saka (Dept. of Metall., Nagoya Univ., Nagoya, Japan). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.277-84 (16 March 1983). Magnesium oxide single crystals are deformed in a Lang camera attached to a high intensity X-ray source. The development of the slip band structure is monitored by a video recording system. The specimens deform by localized slip bands. The slip band structures can partly be related to peculiarities in the stress-strain curves. A small size effects is observed in the macroscopic yield stress as well as in the stress for the initiation of the first slip band. The size effect may explain the discrepancy between the yield stresses measured macroscopically and by in-situ deformation experiments in the high-voltage electron microscope. In some specimens which deform by screw dislocation slip bands, plastic instabilities occur due to the sudden generation and spreading of edge type slip bands. (22 refs.)

76446 The investigation of heat release in slip bands in alkali halide crystals. N.L.Sizova (Inst. of Crystallography, Acad. of Sci., Moscow, USSR), V.D.Natsik, I.I.Gorina, V.R.Regel. *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.447-51 (16 April 1983). An evaluation is made of the temperature rise in slip bands consisting of edge and screw dislocations during deformation of LiF single crystals by compression and the experimental data are compared with those calculated. It is shown using thermosensitive CLC layers that a local temperature rise from 0.1 to 1K is observed in slip bands during the deformation of LiF single crystal specimen. The measured and calculated temperature rises in slip bands are in reasonable agreement. (11 refs.)

76447 Pinning of dislocations on the departure side of strengthening dispersoids. V.C.Nardone, J.K.Tien (Henry Krumb School of Mines, Columbia Univ., New York, NY, USA). *Scr. Metall. (USA)*, vol.17, no.4, p.467-70 (April 1983). Two alternative explanations for the phenomenon observed during creep of oxide dispersion strengthened alloys involving the dislocation/particle configuration. It appears that the dislocations are being pinned even though they are already on the departure side of the oxide dispersoids. It can be proposed that dislocation/particle association leads to a lower energy configuration relative to the case when the dislocation and dispersoid are not in contact. On the other hand, the dislocation/particle configuration may be explained by the local climb of dislocations over particles as proposed by Ham and Brown (1975). (7 refs.)

76448 Dislocation internal friction in crystalline silicon whiskers. S.A.Antipov, V.I.Belyavskii, A.I.Drozhdin (Polytech. Inst., Voronezh, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1854-6 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3268-72 (Nov. 1982). [received: May 1983]

An investigation was made of the relaxation spectrum of the internal friction in plastically deformed silicon whisker crystals. A study was made of the influence of doping with electrically active B, P, and As impurities on the activation energy of the Bordoni relaxation mechanism. The dependence of the activation energy on the degree of doping was attributed to changes in the electron spectrum resulting from the formation and motion of kinks in 60° and screw dislocations. (19 refs.)

76449 Nature of dislocation hysteresis losses and nonlinear effect in lead at high vibration amplitudes. V.V.Lomakin, L.N.Pal'-Val', V.Ya.Platkov, A.M.Roshchupkin (Physicotech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1915-18 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3370-6 (Nov. 1982). [received: May 1983]

The nature of the dislocation hysteresis was established and changes in this hysteresis were determined by investigating the dependence of the dislocation-induced absorption of ultrasound (coefficient α) on the amplitude of ultrasound ϵ_0 in single crystals of pure lead and of lead containing Ti and Sn impurities. The investigation was carried out in a wide range of ϵ_0 under superconducting transition conditions. In the superconducting (*s*) state both pure Pb and that doped with Ti exhibited a maximum in the dependence $\alpha(\epsilon_0)$ at high values of ϵ_0 on transition to the normal (*n*) state this maximum changed to a plateau. This provided a direct proof of a change in the static nature of the dislocation hysteresis to the dynamic process because of an increase in the coefficient of the electron drag of dislocations. Estimates were obtained of the range of lengths of dislocation loops: 2.4×10^{-4} cm $< L_N < 10.4 \times 10^{-4}$ cm. In the case of lead containing Sn the dynamic hysteresis occurred in both the normal and superconducting states. In the range of amplitudes above that of the maximum and at the beginning of the plateau all single crystals exhibited a rise of α on increase of ϵ_0 in the superconducting and normal states; this rise was due to nonlinear effects observed in the case of strong bending of L_N loops. An analysis was made of the amplitude dependence of the losses associated with this effect. The results were in good agreement with the experimental data. (24 refs.)

76450 Investigation of the distributions of distances traveled by short dislocation segments in Ge. V.A.Makara, B.V.Petukhov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.6170L1 a6170Yp (Nov. 1982). [received: May 1983]

The authors report the results of an experimental investigation of the distribution of distances traveled by short dislocation segments in Ge crystals and propose a simple model which makes it possible to explain satisfactorily the results obtained and to derive from them some parameters of the interaction between dislocations and defects. 61.70N Grain and twin boundaries

76451 Effects of triaxial stressing on creep cavitation of grain boundaries. T.-L.Sham, A.Needleman (Div. of Engng., Brown Univ., Providence, RI, USA).

Acta Metall. (USA), vol.31, no.6, p.919-26 (June 1983). Investigates the influence of triaxial stressing on the growth of cavities on grain boundaries by the combined processes of plastic creep flow and grain boundary diffusion. The coupling arises from local accommodation of matter on the grain boundary near the cavity tip due to plastic creep deformability of the grains. This has the effect of shortening the diffusion path length on the grain boundary and increasing the cavity volumetric growth rate. An increase in triaxiality is found to accelerate the matter flux flowing from the cavity surfaces onto the grain boundaries and thus increase the cavity volume-

tric growth rate. This occurs at attainable levels of triaxiality. However, the enhancement in the triaxial stress state does not affect the effective diffusion path length very significantly. A simple formula for the volumetric growth rate of the cavity is suggested and it is found to give a good approximation to the numerically computed results. (13 refs.)

76452 Modified Wulff constructions for twinned particles. L.D.Marks (Dept. of Phys., Univ. of Cambridge, Cambridge, England).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.556-66 (April-May 1983). Reports the application of a modified form of the Wulff construction to derive theoretical shapes and total surface energies for twinned particles. It is proposed that the incorporation of twin boundaries in faceted particles leads to a number of constrained local minimum in the total surface energy (at constant volume), in addition to the minimum of a single crystal Wulff polyhedron. A procedure for generating these constrained local minima is described. The model is then applied to determine the structures of twinned particles in face-centred materials. Two possible configurations are examined, an arrangement where the crystals are symmetric about the twin boundaries, and an asymmetric configuration. Shapes and total surface energies for a large number of twinned structures are given using a simple model which includes only (111) and (100) surface facets. Excellent agreement is obtained between the theoretical model and experimental results. (22 refs.)

76453 Lattice fringe imaging studies of the twin structures in electrocrystallized nickel coatings. N.Atanassov, M.Pasemann (Inst. of Phys. Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria).

J. Microsc. & Spectrosc. Electron. (France), vol.8, no.1, p.25-30 (Feb. 1983). The twin structure of electrocrystallized nickel layers has been examined by means of the lattice fringe imaging method with a tilted incident beam. The results show different kinds of inhomogeneities, as e.g. an intermediate layer of about 1 nm thickness or an agglomeration of impurities inside the twin boundary. (9 refs.)

76454 Investigation of asymmetrical grain boundaries and their coincidence site lattices. An.Nguyen, R.Herrmann, G.Worm (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).

Phys. Status Solidi b (Germany), vol.116, no.2, p.501-10 (1 April 1983). A method for the examination of asymmetrical grain boundaries with randomly directed axes of rotation is presented. In so far as the axis of rotation lies in a plane of symmetry of the crystal the geometrical relation between symmetrical and asymmetrical grain boundaries is shown. The CSL Bravais cells corresponding to asymmetrical grain boundaries and the facet angles for the considered grain boundaries are calculated. (7 refs.)

76455 Determination of the atomic configuration of twin boundaries in tungsten by field-ion microscopy. I.M.Mikhailovskii (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1822-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3210-15 (Nov. 1982). [received: May 1983]

Field-ion microscopy was used to study the structure of twin boundaries in deformed and recrystallized tungsten. An analysis of the atomic topography of the surface near twin boundaries showed that twins in tungsten are of the reflection type without rigid translation of lattices. It was established that those dislocations at twin boundaries which compensate the lattice misorientation from the special case are perfect lattice dislocations with the Burgers vector $1/2 [111]$. The core radius of such dislocations is 0.3-0.7 nm in deformed tungsten and 0.3-0.5 nm in recrystallized samples. Lattice and twinning dislocations at twin boundaries do not split into partial and zonal dislocations. (17 refs.)

61.70P Stacking faults, stacking fault tetrahedra and other planar or extended defects

76456 HREM and STEM of defects in multiply-twinned particles. L.D.Marks (Cavendish Lab., Univ. of Cambridge, Cambridge, England), D.J.Smith. *J. Microsc. (GB)*, vol.130, pt.2, p.249-61 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). The structure of defects in multiply-twinned particles has been studied in detail using high-resolution lattice imaging, dark field and microdiffraction techniques. Icosahedral particles with sizes greater than about 15 nm were found to contain defects, in the form of stacking fault loops parallel with the external surface, which were extremely difficult to detect by conventional amplitude contrast techniques. Microdiffraction mappings correlated with these results showing large rotations of the face-centred cubic segments. Results for decahedral particles indicated the presence of stacking faults running adjacent to, and parallel with, the twin boundaries. Microdiffraction maps confirmed that the particle structure was face-centred cubic, and also verified that the apparent epitaxy of these particles was highly variable. Models for the defects are proposed and discussed, and the relative merits of HREM and STEM for elucidating structural details in small particles is briefly considered. Finally, the potential for direct imaging at surfaces, as demonstrated by some recent images, is discussed. (29 refs.)

76457 Orientation dependence of oxidation stacking fault density in silicon. A.I.Pekarev, G.F.Krasnova, G.Z.Nemtsev (Moscow Inst. of Electronic Tech., Moscow, USSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.327-30 (16 March 1983). Cylindrical silicon samples are oxidized in wet atmosphere at 1150°C. The dependences of the oxidation-induced stacking fault (OSF) density on the cylindrical surface orientation are obtained for the zones {001} and {111}. The 'shallow' minima are located on the planes {100} and {110} and the 'deep' minima on high-index atomic-rough planes. A model is proposed, according to which OSF are formed on surface mechanical damages and on point defect clusters and precipitates. The calculated and experimental curves behave identically. (7 refs.)

76458 The correct rules for determining the sign of fault vectors in X-ray topography. A.R.Lang (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.595-9 (16 April 1983). The sign conventions employed in electron and X-ray diffraction contrast theories of stacking faults are discussed with reference to their predictions concerning the dependence of first-fringe contrast upon the sign of the fault vector under diffraction conditions when anomalous transmission is significant. It is pointed out that since 1975 error has appeared in papers dealing with the X-ray case. Guidance for the correct interpretation of X-ray topographs is given. (20 refs.)

76459 Investigation of radiation induced aggregates by phonon techniques. J.M.Grimshaw, M.Locatell (CENG-SBT/LCP, Grenoble, France). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.119-23 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). The authors discuss the determination of the size of extended defects in solids using phonon scattering, a method which has the advantage that it does not create further damage in the crystal during the investigation. They describe the principle of the method as it has been developed using thermal conductivity, then discuss the operation and applicability of the superconducting tunnel junction phonon spectrometer, and finally consider the phonon microscope. 61.70T Doping and implantation of impurities

76461 Modulation doping structures in silicon by molecular beam epitaxy and off-line ion implantation. T.De Jong, W.A.S.Douma, S.Doorn, F.W.Saris (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands). *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.157-62 (April 1983).

The authors have made buried layers and modulation doping profiles in Si by combining ultrahigh vacuum Si molecular beam epitaxy with off-line ion implantation. Abrupt doping profiles were obtained by using low implantation energy and a low temperature substrate preparation step prior to growth. (16 refs.)

76462 Exact solutions to a model for the growth of radiation damage during progressive ion implantation. C.H.J.Johnson (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.3, p.73-8 (1983).

A kinetic model for the growth of radiation damage based on different types of scattering center is discussed and the exact (implicit) solution is given for the concentrations of trapped interstitials as functions of the fluence. (2 refs.)

76463 Ion implantation damage and annealing in germanium. O.W.Holland, B.R.Appleton, J.Narayan (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2295-301 (May 1983). The authors have observed a unique damage structure, which forms within the amorphous phase, in ion-implanted Ge above a certain ion dose. This structure, which represents a drastic alteration of the near-surface morphology, is responsible for the adsorption of large quantities of C and O onto the surface of the implanted area. Results are presented of a systematic study of this effect and possible mechanisms for its information are discussed. Ion implantation conditions desirable for device applications are established and deleterious effects due to the presence of this damage upon both solid- and liquid-phase epitaxial growth of the implanted layers are discussed. (19 refs.)

76464 Pulsed thermal annealing of ion-implanted silicon. P.D.Scovell, E.J.Spurgin (Standard Telecommunication Labs. Ltd., Harlow, England). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2413-18 (May 1983).

The use of a graphite strip heater to anneal implanted silicon has been investigated. The good electrical activity of an arsenic implanted layer obtained after annealing in this way is shown to degrade after simulated low temperature processing and lead to highly resistive layers. The annealing system has been used to reactivate such layers by employing high temperature thermal pulses of short duration which avoids excessive inter-diffusion. The same annealing schedule has been used successfully to activate highly doped antimony, boron, and phosphorous layers. The importance of controlling the ambient has also been studied and it is concluded that annealing in nitrogen avoids out-diffusion of dopant from the surface. (7 refs.)

76465 Radiation damage in ion-implanted quartz crystals. II. Annealing behaviour. H.Fischer, G.Gotz, H.Karge (Sektion Phys., Friedrich-Schiller-Universität, Jena, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.493-8 (16 April 1983).

For pt.1 see ibid., vol.76, p.249 (1983). Quartz crystals (Z-cuts) are implanted with Ar⁺ (150 keV) and He⁺ (35 keV) ions at room temperature. The annealing behaviour of the radiation damage between 300 and 1370K is investigated by Rutherford backscattering spectrometry (RBS). Three stages with different thermal stability of the defects are found: 1. Simple defects produced at nuclear deposited energy densities $G_n \approx 1 \times 10^{20}$ keV cm⁻³ can be completely annealed at 770K. 2. Amorphized microregions generated between $G_n = 1 \times 10^{20}$ keV cm⁻³ and 2.5×10^{20} keV cm⁻³ fully recrystallize at 1270K. 3. RBS-amorphous layers formed at $G_n \geq 2.5 \times 10^{20}$ keV cm⁻³ cannot be annealed. (12 refs.)

76466 Recoil implantation yields and depth profiles. Analytical expressions for primary and cascade contributions. A.Gras-Marti (Dept. de Física, Univ. de Alicante, Alicante, Spain).

Phys. Status Solidi a (Germany), vol.76, no.2, p.621-7 (16 April 1983). Recoil implantation of thin layers into the underlying substrate material is described within multiple scattering theory. Simple analytical expressions are derived for both primary and cascade recoil implantation yields and depth profiles. Predictions are compared with those of other models. (20 refs.)

76467 Ion implantation in group II-VI compounds. F.J.Bryant (Dept. of Phys., Univ. of Hull, Hull, England). *Prog. Cryst. Growth & Charact. (GB)*, vol.6, no.2, p.191-263 (1983).

A brief survey of possible experimental arrangements for ion implantation, with particular reference to those in the author's laboratory, is followed by a discussion of implantation parameters which have been shown to be important in the implantation doping of group II-VI compounds. There follows an illustration of the value of implantation in providing samples suitable for monitoring electron radiation damage and determining atomic displacement threshold energies in II-VI lattices. The potentialities of laser annealing and electron beam annealing are considered briefly. Optically-detected magnetic resonance is shown to be an important new technique in the study of radiation damage and the identification of defects in ion-implanted layers. Experimentally-observed changes in the energy splittings of implanted rare earth ions have been observed after various post-implantation isochronal annealing treatments and they have been compared with theoretical calculations based on simple crystal field models to give lattice site locations of the implanted ions. A review of published implantation work on II-VI compounds is followed by some thoughts on the future of ion implantation studies in II-VI compounds. (100 refs.)

76468 Isolation of Fe charge states by ion implantation and their study by Mossbauer spectroscopy. M.van Rossum, E.Verbiest, H.Pattyn, R.Coussement (Inst. voor Kern- en Stralingsfysika, Leuven, Belgium), S.Bukhsan. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.77 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Summary form only given, as follows. Matrix isolation of impurity atoms in a frozen rare-gas lattice is a well-known technique for the study of atoms in quasi-free states. The usual procedure consists of co-evaporating these atoms together with the matrix atoms and depositing them simultaneously on a cold substrate. Subsequently, the frozen samples can be studied by optical spectroscopy or, as has been proved more recently, by Mossbauer spectroscopy. The technical limitations of the co-evaporation procedure narrow the application range of this method. The authors have therefore tried to develop the ion implantation technique as a suitable alternative to the co-evaporation. Ion implantation does not put any limitation on the species and the concentration of the isolated atoms; moreover, it is particularly suited for the isolation of radioactive impurities, which may be investigated by Mossbauer spectroscopy. In a first series of experiments, ⁵⁷Co has been implanted into a frozen Xe matrix, thereby producing isolated Fe²⁺ and Fe⁰ states by the electron capture decay of the implanted nuclei. A second experiment was devoted to the study of ⁵⁷Fe implanted in solid O₂. Due to the high reactivity of oxygen, it would

have been impossible to produce this sample by co-evaporation. Mossbauer data show some evidence that in this case Fe^{2+} states have been produced. The results of these experiments will be discussed and further perspectives will be sketched. (2 refs.)

76469 Ion implantation in insulators. P.Thevenard (Dept. de Phys. des Matériaux, Univ. Claude Bernard Lyon I, Villeurbanne, France). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.117 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). The modifications of insulating materials by ion implantation can be of considerable interest for many applications. The main parameters which determine the charge state and site location of the implanted atoms in insulating targets are: ionicity of the chemical bond of the lattice, electronegativity, thermal or radiation enhanced diffusion processes, and intrinsic defects. For heavily implanted insulators, phase changes of compositional type can occur which can lead to strong modifications of the physical properties of the implanted layer. In order to obtain information of the relative extent of the critical parameters of chemical implantation in insulators it is necessary to combine analysis with different techniques such as, nuclear techniques, TEM, ESR, optical spectroscopy, X-ray diffraction at glancing analogue, etc. To illustrate the effects of these parameters, typical experimental results obtained in implanted binary or ternary compounds are reported (alkali halides, silver halides, alkaline earth oxides or fluorides, transition metal oxides, natural minerals, etc.). (no refs.)

76470 Chemical effects of carbon ion implantation into alkali halides. K.Rossler, A.Wolthuis, R.K.Bera (Inst. für Chemie I, KFA Jülich GmbH, Jülich, Germany). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.181 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). The implantation of 230 keV carbon ions into alkali halide single crystals AX (A=Na, K, Rb, Cs; X=F, Cl, Br, I) at temperatures $T \leq 77\text{K}$ gives rise to intensive, highly resolved, optical absorption bands in the visible regions (2.3-2.8 eV, peak half width ~ 0.004 eV). They resemble very much the Swan band system of matrix isolated C_2 . The influence of the matrix on the fine structure of the absorption bands is discussed. These carbon-centres are formed to a lesser extent or not at all when implanting at 200K and 300K, respectively. They bleach out at room temperature. Radiochemical experiments at room temperature with carbon atoms stemming from the $^{14}\text{C}(\text{p},\alpha)^{11}\text{C}$ -nuclear reaction in BN/AX mixtures show the formation of carbon compounds such as CX_4 , CX_3H , CX_2H_2 , CXH_3 and CH_4 . Thus, the primarily formed C_2 -aggregate or C-X intermediates which are stable at $T \leq 77\text{K}$, at higher temperature are gradually transformed to stable carbon-halogen compounds. The reactions of matrix isolated carbon upon dissolving the ionic crystals are of interest for the labelling of organic compounds with ^{11}C . (no refs.)

76471 Compound synthesis in TiO_2 implanted with rubidium. M.Guer-mazi, P.Thevenard, C.Dupuy (Dept. de Phys. des Matériaux, Univ. Claude Bernard Lyon I, Villeurbanne, France). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.197 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Rubidium ions, with energy in the range 0.1 MeV, 2.0 MeV have been implanted in TiO_2 single crystals at RT and LNT. Defects induced by implantation have been studied by optical spectroscopy, X-ray diffraction, RBS, TEM and electrical conductivity. During implantation, the implanted samples are blue colored after irradiation. This coloration is due to an optical absorption band localized at 900 nm which corresponds to optical transition of intrinsic defects identified at Ti^{3+} . These defects are induced by a chemical reaction between the implanted ions and the oxygen of the lattice. The synthesis of a new phase in heavily implanted rutile is exhibited by using a thermal treatment and by combining techniques such as RBS, TEM and X-ray diffraction at glancing angle in the temperature range 300°C-700°C. Planar defects have been observed in the implanted area. A correlation is exhibited between these defects and the precipitates of the new phase. From X-ray diffraction measurements and TEM observations, the composition of the synthesized compound is likely Rb_2TiO_3 . (3 refs.)

76472 Study of ytterbium implanted calcia stabilized zirconia thin films and yttria stabilized zirconia single crystals. C.Cohen, J.Siejka (Univ. Paris VII, Paris, France), M.Berti, A.V.Drigo, M.Croset, M.M.Tosic. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.221-31 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Calcia stabilized zirconia thin films and yttria stabilized zirconia single crystals were Yb implanted at 150 and 210 keV, and at various doses up to 1.3×10^{17} ions/cm² in order to modify locally the oxygen transport properties. Rutherford backscattering and nuclear microanalysis on the implanted thin films give information about the implantation profiles and sputtering yields. The results show that the ratio of the sputtering rates of two elements of the film is equal to their concentration ratio. At high implantation doses the Yb profile is nearly flat in the surface region with $[\text{Yb}]/[\text{Zr}] = 1.1$. ^{18}O tracing experiments demonstrate that a significant oxidation of the implanted samples occurs in air at room temperature. Further oxidation takes place during a 500°C annealing in air which does not modify the Yb profile and leads to a final mean composition. For the YSZ single crystals, channelling measurements demonstrated that the implanted region is highly damaged. As YSZ and Yb stabilized zirconia have the same lattice parameters, after high temperature annealing (1000 to 1300°C), a good crystalline quality and a full epitaxy with the YSZ substrate is achieved in this region even for the highest implantation dose. The annealings do not modify markedly the Yb profiles. (14 refs.)

76473 Furnace annealing of ion implanted polycrystalline silicon. J.L.Tandon, H.B.Harrison, C.L.Neoh, K.T.Short, J.S.Williams (Dept. of Communication & Electronic Engng., RMIT, Melbourne, Australia). Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.317-23. Rutherford backscattering, Van der Pauw and TEM measurements were used to characterise the annealing behaviour of antimony implanted LPCVD polysilicon. High electrical activity without dopant redistribution was obtained for 600°C annealing of 1×10^{15} cm⁻² and 3×10^{15} cm⁻² antimony implanted samples. Subsequent annealing at temperatures $\geq 900^\circ\text{C}$ resulted in considerable grain-boundary-assisted redistribution of antimony within the polycrystalline layers and associated changes in sheet resistance. The authors' results suggest that the sheet resistance of the films is controlled by dopant segregation at grain boundaries and the fraction of antimony distributed on active sites within individual grains. (20 refs.)

76474 Double doped low dislocation density InP with low optical absorption. A.A.Ballman, A.M.Glass, R.E.Nahory, H.Brown (Bell Labs., Holmdel, NJ, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.15-21. Liquid encapsulated Czochralski growth of low dislocation density, low optical absorption InP single crystals has been achieved by double doping with sulfur (donor) and zinc (acceptor) impurities. The dislocation density is controlled by the total impurity content $N_A + N_D$ while the free carrier concentration, which determines the optical absorption, is controlled by the difference $N_D - N_A$ of the active sulfur and zinc concentrations. The authors demonstrate that the technique gives the degree of freedom to grow crystals with low dislocation densities and with independent control of free carrier concentrations. Optical absorption coefficients as low as 1 cm^{-1} at $1.3 \mu\text{m}$ have been measured on crystals with dislocation densities from 10^2 to 10^3 cm^{-2} . (9 refs.)

76475 Incorporation of amphoteric impurities in high purity GaAs. T.S.Low, B.J.Skromme, G.E.Stillman (Electrical Engng. Res. Lab., Univ. of Illinois, Urbana, IL, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.515-22. The incorporation of Group IV impurities as donors and as acceptors in high purity epitaxial GaAs has been investigated using photothermal ionization spectroscopy and variable temperature photoluminescence to detect donors and acceptors respectively. Samples from several sources of high purity LPE, AsCl_3 -VPE, AsH_3 -VPE, MOCVD, and MBE, grown GaAs were measured to establish the typical residual impurities present and their relative concentrations. For AsH_3 -VPE, MOCVD and MBE GaAs, impurity incorporation data are presented as a function of III/V ratio. The relative incorporation of amphoteric impurities as donors and acceptors is compared with the model of Teramoto (1972) for LPE and its extension to AsCl_3 -VPE by Ashen et al. (1975). (16 refs.)

76476 Effects of relative damage, Fermi energy and annealing technique in ion implanted GaAs. H.Kanber, M.Feng (Torrance Res. Center, Hughes Aircraft Co., Torrance, CA, USA), J.M.Wheeler. Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.605-12. Be and Cd were implanted into Cr-O doped horizontal Bridgman, undoped LEC and undoped VPE GaAs substrates and capless annealed in an As_4/H_2 atmosphere. Low dose Be implants upon annealing had concentration depth profiles which strongly depended on the GaAs origin. Cr and Mn redistribute quite differently for acceptor and donor implants. A model is proposed to describe the observations which incorporates the effects of relative damage due to the implant, the effect of Fermi energy on impurity migration and the effect of the arsine overpressure and anneal temperature on the diffusion profiles. (11 refs.)

76477 Implantation annealing in GaAs by incoherent light. D.E.Davies (Rome Air Dev. Center, Hanscom AFB, MA, USA), P.J.McNally, T.G.Ryan, K.J.Soda, J.J.Comer. Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.619-25. Implanted GaAs has been successfully activated through concentrating the output of quartz halogen lamps to anneal in times ~ 1 sec. The resulting layers are not restricted by the reduced mobilities and thermal instabilities of laser annealed GaAs. Better activation can be obtained than with furnace annealing but this generally requires maximum temperatures $\geq 1050^\circ\text{C}$. (12 refs.)

61.70W Impurity concentration, distribution, and gradients

(see also 66.30J Diffusion, migration and displacement of impurities)

- 76478 A new profiling technique applicable to the measurements sensitive to the free-carrier concentration rather than the depletion-layer thickness. B.Davari, P.Das (Electrical, Computer & Systems Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA). *IEEE Electron Device Lett. (USA)*, vol.EDL-4, no.6, p.169-72 (June 1983). A novel profiling procedure, where the free-carrier concentration is the primary measured quantity, is demonstrated. This method allows the depth profiling of the dopant concentration and other properties such as trap energy levels and generation lifetime by measurements monitoring such parameters as surface conductivity, surface photovoltage, reflectance, transverse acoustoelectric voltage (TAV), and Hall voltage. Nondestructive profiling is also possible by contactless methods, e.g. TAV measurements. The distinct difference between the pulsed capacitance-voltage (C-V) measurement and the proposed procedure is that in the former the measurable physical quantity is the depletion-layer width which is modulated by an external field. In the technique proposed here, the carrier concentration as a function of bias field is monitored and the depletion-layer width is then calculated. The theoretical analysis leading to the evaluation of the depletion width as a function of bias field is presented along with an experimental example, utilizing the nondestructive TAV measurement. (14 refs.)
- 76479 Matrix effect and surface oxidation in depth profiling of $\text{AlGa}_{1-x}\text{As}$ by secondary ion mass spectrometry using O_2^+ primary ions. C.Meyer, M.Maier (Inst. für Halbleitertechnik, RWTH Aachen, Aachen, Germany), D.Bimberg. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2672-6 (May 1983). The dependence of the ionization probability in secondary ion mass spectrometry experiments of the dopants Be, Ge, and Sn and the matrix atoms Ga and As in $\text{AlGa}_{1-x}\text{As}$ with $0 \leq x \leq 0.83$ on the matrix composition is determined using O_2^+ primary ions. The composition of the surface is analyzed for the first time by Auger electron spectrometry during O_2^+ bombardment. The ionization probability shows an approximately linear increase with increasing Al content ranging from a factor of 2.5 (for Ga^+) to 7.5 (for Ge^+). The variation of the ionization probability is a function of the degree of oxidation which depends on the metal-oxygen bond energy and on the availability of oxygen. The availability of oxygen is controlled by the implantation sputtering process during O_2^+ bombardment. (17 refs.)
- 76480 Measuring the density distribution of a charged impurity in thin silicon films by electron reflection. G.V.Galiev, V.V.Kapaev, V.G.Mokrov. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1400-1 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2281-2 (Nov. 1982). [received: May 1983]
- The trend toward thinner active regions in micro- and optoelectronic devices requires the development of precise methods for controlling the spatial density distribution N of charged impurity in thin (submicron) semiconductor layers. The authors promising method for monitoring the density of activated impurities in semiconductors involves electron reflection. The authors report for the first time data obtained by electron reflection combined with successive etching of semiconductor layers. The authors recorded the charged impurity density distribution as a function of depth in silicon wafers. The low-field electron reflection spectra were recorded using standard electrolytic methods for photon energies in the range $h\nu = 3.1\text{--}3.8$ eV. The thin surface regions of the wafer samples were doped with ions to form regions with widely differing impurity densities as a function of depth. The authors studied $\text{n}^+\text{-n}$ and $\text{p}^+\text{-p}$ structures. (6 refs.)
- 76481 Coulomb potential fluctuations in high-purity n-type III-V semiconductors. P.A.Fedders (Dept. of Phys., Washington Univ., St. Louis, MO, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.545-52. Investigates the effects of fluctuations in the Coulomb potential due to charged impurities in high-purity n-type III-V semiconductors at low temperatures. Assuming that charged donors and acceptors are randomly distributed at high temperatures, the author concludes that the donors are selectively filled at low temperatures leaving nonrandom distributions of charged and filled donors. The potential fluctuations from these distributions can approximately account for a number of experimental observations on low-temperature high-purity GaAs. (10 refs.)

61.70Y Interaction between different crystal structure defects

- 76482 Photo-chemical reaction and photo-induced polarization studies in sulphur-doped potassium bromide. J.Prakash (Dept. of Phys., Univ. of Gorakhpur, Gorakhpur, India). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.161-9 (1 May 1983). The absorption bands of Sn^{2+} -anion vacancy dipoles in KBr lie in the ultraviolet range. Irradiation in the short-wavelength absorption bands results in a photochemical reaction. It is observed that the irradiation in the presence of an electric field in the long-wavelength absorption band creates a situation in which more dipoles are aligned along the electric field direction. Irradiation in the absence of the electric field in the long-wavelength absorption band is found to destroy the frozen-in alignment of polarized dipoles. (27 refs.)

The authors investigate the inhomogeneity effect between a vacancy and a dislocation line in α -iron. They consider the physical consequences of this interaction in creep, void swelling, positron annihilation and pre-vacancy effects. (8 refs.)
- 76484 Interaction of dislocations with impurities in silicon crystals studied by in situ X-ray topography. K.Sumino, M.Imai (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Philos. Mag. A (GB)*, vol.47, no.5, p.753-66 (May 1983). The characteristics of dislocation locking due to the development of an impurity atmosphere have been investigated by the in situ X-ray topographic technique for silicon crystals doped with various types of impurities. Oxygen, nitrogen and phosphorus atoms are found to be effective in locking dislocations while carbon atoms are not. The dependence of the locking behaviour on the impurity concentration is investigated in detail for oxygen-doped crystals. It is known that the magnitude of the locking force is determined uniquely by the number of impurity atoms congregated on a unit length of dislocations if the species and concentration of the impurity atoms in the crystal are specified. Individual nitrogen atoms exhibit the strongest locking effect among the impurity atoms investigated. However, locking proceeds most pronouncedly in oxygen-doped crystals owing to a high diffusion rate and a higher solubility of oxygen atoms in silicon. The origins of the strong locking effects at various impurity atoms are discussed. (21 refs.)

61.80 RADIATION DAMAGE AND OTHER IRRADIATION EFFECTS

[for techniques of structure determination, see 61.10 to 61.16; for electron and ion impact phenomena, see 79.20]

76486 Annealing of arsenic- and antimony-implanted silicon single crystals using a CW xenon arc lamp. A.Nylandsted Larsen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark), L.Correra. *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.3, p.67-72 (1983). Continuous, incoherent light from a xenon arc lamp has been used to anneal radiation damage in (100) silicon single crystals produced by implantation of 30-keV arsenic or antimony ions to doses between 1×10^{15} cm⁻² and 1×10^{16} cm⁻². The recrystallized layers have been characterized by Rutherford-backscattering spectroscopy, ion-channeling, transmission electron microscopy, and sheet-resistivity measurements. (16 refs.)

76487 Calculation of temperature fields in a silicon film during an optical anneal. N.I.Sterzhanov, V.I.Pilipenko, V.N.Topchii, L.S.Slobodkin, G.N.Pshenichnaya, P.A.Vakul'chik (A.V. Lykov Inst. of Heat & Mass Transfer, Acad. of Sci., Minsk, Belorussian SSR). *J. Eng. Phys. (USA)*, vol.43, no.3, p.1032-5 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.463-7 (Sept. 1982). The authors consider a theoretical method for the calculation of temperature fields in silicon films during a pulsed optical anneal. (9 refs.)

76488 Radiation damage in crystalline insulators, oxides and ceramic nuclear fuels. Hj.Matzke (Commission of the European Communities, Joint Res. Centre, Karlsruhe Establ., Karlsruhe, Germany). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.3-33 (1982). [received: May 1983]. (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Studies of radiation damage in crystalline insulators usually originate from problems connected with heavy ion impact during ion bombardment, from neutron irradiation with and without fission in nuclear reactors, or from α -decay with the resulting damage due to recoil daughter atoms of the decaying nuclei of actinide compounds. The materials involved cover a broad range of compounds, e.g. from BeO to CmO₂ for oxides, for which most work has been done. The damage studied ranges from production of isolated Frenkel pairs to complete amorphization of the crystalline compound (metamictization). The available knowledge is discussed. Emphasis is put on simple binary oxides and on ceramic nuclear fuel materials, i.e. oxides carbides and nitrides of U and Pu. Recent work on irradiated glasses is also briefly discussed since these glasses are considered as promising media for safe storage of radioactive waste for long periods of time. (181 refs.)

61.80B Laser beams

76489 Optical transmission at 3.39 μ m during pulsed laser annealing of silicon. S.A.Lyon, Y.H.Chen, J.F.Lin (Dept. of Electrical Engng. & Computer Sci., Princeton Univ., Princeton, NJ, USA). *Appl. Phys. Lett. (USA)*, vol.42, no.11, p.978-80 (1 June 1983). The authors have measured the infrared transmission at 3.39 μ m, for bulk Si and Si:Al and for silicon on sapphire during pulsed laser annealing. The transmission drops sharply and remains near zero for approximately 100 ns in all samples. The infrared transmission in bulk Si requires milliseconds to completely recover. They attribute this effect to a thermally induced change in the index of refraction of the silicon and associated tuning of the Fabry-Perot cavity formed by the faces of the Si wafers. Their experiments yield no evidence for an optical gap as expected for a Bose condensed exciton phase, and thus are supportive of the thermal melting model of laser annealing. (21 refs.)

76490 Incorporation of oxygen atoms into As⁺ implanted silicon during CW CO₂ laser annealing in O₂. I.W.Boyd (Phys. Dept., Heriot-Watt Univ., Edinburgh, Scotland). *Appl. Phys. A (Germany)*, vol.A31, no.2, p.71-4 (June 1983). By annealing Si layers amorphised by ion-implantation with a CW CO₂ laser beam in oxygen rich environments, it has been possible to incorporate O atoms into the recrystallized lattice. Absorption measurements on such regrown layers by infrared spectrometry have shown that the impurities are preferentially bonded into substitutional lattice sites, rather than existing interstitially. Supplementary RHEED studies have indicated that β -cristobalite, a crystalline form of SiO₂, has been formed. These investigations highlight the importance of the ambient during CW laser annealing. (15 refs.)

76491 Bubble growth in laser irradiated glass. D.E.Hastings (Phys. Sci. Inc., Woburn, MA, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2223-9 (May 1983). The authors have considered the problem of the growth of a bubble from a preexisting nucleation site in laser irradiated glass. They show that thermal expansion of gases inside the bubble will not give significant growth. For glass temperatures below the vaporization temperature they show that a bubble can grow by CO₂ diffusion for glasses with a soda content. For glass temperatures above the vaporization temperature they examine the growth of vapor bubbles. They conclude that bubbles of several microns in size can be obtained in laser irradiated glass. (19 refs.)

76492 Temperature evolutions in silicon induced by a scanned CW laser, pulsed laser, or an electron beam. F.Ferrieu, G.Auvert (CNET-CNS, Meylan, France). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2646-9 (May 1983). A self-consistent time procedure for solving a nonlinear heat diffusion equation is proposed. This paper addresses three-dimensional time dependent heat equations with nonlinear sources and diffusivity. The semianalytical model of the static regime is thereby extended to transient treatment. The advantage of this method is that it allows handling of nonlinearity in the heat diffusion equation, while keeping calculations simple. The method may be applied to either a CW laser beam or a pulsed beam. In the latter case, the method applies for any spot size, since the problem remains three-dimensional. Different deposited energy penetrations are reviewed, among them the Gaussian-shaped deposited energy corresponding to the case of the scanned electron beam. Using this method, temperatures are calculated and compared with the high speed melting isotherm for silicon under CW laser irradiation. (12 refs.)

76493 Laser-stimulated mass transfer in metals. M.E.Gurevich, L.N.J.arikov, V.G.Novitskii, A.E.Pogorelov, A.F.Zhuravlev (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.479-84 (16 April 1983). Mass transfer in iron and nickel stimulated by pulsed laser radiation is studied by the radioactive isotope method. New experimental results are obtained and an analysis in terms of kinetic equations is given. It is shown: (a) exposure of the metal surface to high intensity pulsed laser radiation leads to an accelerated atomic migration into the sample; (b) an effective retardation, the value of which depends upon the presence of crystalline defects in metals has an essential influence on the atomic migration rate stimulated by the laser; (c) multiple laser loading results in a concentration maximum formed inside the sample, the depth displacement of which depends upon the energy of light flux and the number of pulsed loadings. (14 refs.)

76494 Nanosecond optical transmission studies of laser annealing in ion-implanted silicon-on-sapphire. M.C.Lee, H.W.Lo, A.Aydinli, G.J.Trott, A.Compaan (Dept. of Phys., Kansas State Univ., Manhattan, KS, USA), E.B.Hale. *Solid State Commun. (USA)*, vol.46, no.9, p.677-80 (June 1983). Time-resolved optical transmission has been studied using 633 and 514 nm CW probes on ion-implantation-amorphized silicon-on-sapphire during annealing by a 10 nsec, ~ 1 J/cm² pulse at either 532 nm or 485 nm. As recrystallization sets in the transmitted signal at 514 nm rises by $\sim 10^3$ in ~ 60 nsec and provides a measure of regrowth velocity. Beyond 200 nsec the much slower transmission rise is used to provide an estimate of the Si cooling rate. The difference in transmission observed between initially crystalline and initially amorphous Si provide an estimate of the latent heat of recrystallization of the amorphous phase. (17 refs.)

76495 Periodic structure formed during the action of high-power coherent radiation on a semiconductor surface. V.P.Aksenov, B.G.Zhurkin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.630-1 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1365-6 (Aug. 1982). [received: May 1983]. Reports the results of a study of the parameters of the diffraction gratings which are formed on the surface of germanium and silicon under intense optical radiation. Unpolarized Nd:YAG-laser radiation was focused on the surface of the germanium. The Q-switched Nd:YAG laser ($\lambda=1.06 \mu$ m) had a power of 100 kW at a pulse length of around 100 nsec and a pulse-repetition frequency of 400 Hz. The formation of structure on the surface of the sample was monitored by observing the intensity of the diffracted rays of the second harmonic of the Nd:YAG laser ($\lambda=0.53 \mu$ m). (6 refs.)

76496 Critical factors in laser and electron beam glazing of materials. P.R.Strutt, B.G.Lewis (Univ. of Connecticut, Storrs, CT, USA), B.H.Kear. Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.485-95. The major effects of laser and electron beam glazing on solidification microstructure and melt zone geometry are described. It is shown that under comparable processing conditions, i.e. absorbed power density and interaction time, the glazed microstructures are similar. Some variations in microstructure of laser and electron beam glazed M2 steel have been noted, which seem to be related to fluid flow effects in the melt zone and possible interactions with the environment. (8 refs.)

76497 Characterization and properties of laser quenched aluminum bronzes. C.W.Draper (Western Electric, Princeton, NJ, USA), J.M.Vandenberg, C.M.Preece, C.R.Clayton. Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.529-33. Commercial aluminum bronze (Cu-Al-Fe) alloys have been laser quenched with both continuous and pulsed CO₂ laser sources. Metastable near surface regions of approximately 10 μ m thickness have been produced. The quenched surfaces have been characterized by optical microscopy, SEM, EDX, AES and glancing angle XRD. The behavior of both laser quenched and 'as received' conventional surfaces have been tested in both cavitation erosion and corrosion environments. In some cases significant differences are observed and can be rationalized from the microstructural changes accompanying the self quenching. (19 refs.)

76498 Radiation effects in CaWO_4 crystals. E.Ekpo Eno, R.Grasser, A.Schermann (I. Phys. Inst., Justus-Liebig-Universität, Giessen, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.113-16 (16 April 1983). The authors report results on CaWO_4 single crystals under irradiation with X-rays or 1 MeV protons that include luminescence and optical transmission measurements at temperatures ranging from LNT (liquid nitrogen temperature) to RT (room temperature). The X-rays were produced in a 150 kV, 20 mA tube. The 1 MeV protons came from a high voltage 1.3 MeV Van-de-Graaff accelerator. (9 refs.)

76499 Radiation damage in polyacrylonitrile. M.R.Murthy (Dept. of Phys., Kakatiya Univ., Warangal, India), S.Radhakrishna. *Pramana (India)*, vol.20, no.1, p.85-90 (Jan. 1983). [received: May 1983] Radiation damage in polyacrylonitrile (PAN) has been studied in the temperature range 273 to 420 K using thermoluminescence, electron spin resonance and optical absorption techniques. A TL glow peak has been observed with maximum at 362 K. The species responsible for the TL glow peak has been identified to be due to the free radical $-\text{CH}_2\cdot\text{CH}(\text{CN})\text{CH}_2\cdot\text{CH}(\text{CN})\text{CH}_2\cdot$ by correlation with the data obtained by the temperature variation of ESR and optical absorption spectra of the x-irradiated, pre- and post-x-irradiated and thermally-treated samples. A mechanism of formation of network structures accelerated by the free radicals formed on irradiation has been investigated to explain the optical absorption spectra. The TL glow peak is analysed by various methods and corresponds to an activation energy of 1 eV, following second order kinetics. (14 refs.)

76500 Annealing of defects in X-ray and electron irradiated $\text{Cd}_x\text{Hg}_{1-x}\text{Te}$ single crystals. O.A.Kramchenko, M.V.Pashkovskii, N.A.Chutskii. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.717-20 (May 1983). In Russian. X-ray irradiation at 77 K induces formation of defects in $\text{Cd}_x\text{Hg}_{1-x}\text{Te}$ single crystals. These defects cause changes in the conductivity and Hall constant. Annealing of the formed defects occurs at one state in a 130-220 K range. The value is obtained for the annealing activation energy $-E = 0.05 \pm 0.02$ eV. Annealing data are in good agreement with those for the temperature dependence of conductivity before and after irradiation. On the basis of the results obtained Te vacancies are supposed to form due to X-ray irradiation in $\text{Cd}_x\text{Hg}_{1-x}\text{Te}$. (7 refs.)

61.80E Gamma rays

76501 Effects of gamma-ray irradiation on OH^- doped KBr crystals. A.Scacco, F.Somma (Istituto di Fisica, Univ. di Roma, Roma, Italy). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.1-2, p.7-12 (1983). Crystals of undoped and OH^- doped KBr have been γ -ray irradiated at room temperature. Colouring curves of doped samples show bleaching effects with highly absorbed energy doses. This result is interpreted in terms of a reaction between the OH^- impurities and the formed F-centres which predominate on the enhancement of the colouration due to the excess of anion vacancies induced by the OH^- defects. (15 refs.)

76502 Gamma radiation effects on the strength of a borosilicate glass. W.A.Zdaniewski, T.E.Easler, R.C.Bratt (Dept. of Materials Sci. & Engng., Pennsylvania State Univ., University Park, PA, USA). *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.311-13 (May 1983). The effects of ^{60}Co gamma radiation on the strength-related mechanical properties of a borosilicate glass were examined. Although the glass darkened considerably, only a very slight densification was observed after irradiation to levels of 10^6 rads. The strength distributions were not appreciably changed by the irradiation, nor was the calculated slow crack growth parameter, or N value. Neither did radiation affect the elastic modulus or the fracture toughness of the glass. Gamma radiation does not affect the strength below 10^6 rads. (27 refs.)

76503 A study on radiation-resistance of PIC (polymer-impregnated concrete) for container of conditioning and disposal of low and intermediate level radioactive wastes. K.Ishizaki (Central Lab., Chichibu Cement Co. Ltd., Kumagaya, Japan), K.Araki, Y.Kasahara, G.Sudoh. *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.354, p.327-33 (March 1983). In Japanese.

The application of PIC (polymer-impregnated concrete) to the container for conditioning and disposal of low and intermediate level radioactive wastes have been investigated, because the PIC has excellent characteristics such as high mechanical strength, high water impermeability, good corrosion resistance and good durability. It is necessary to evaluate the resistance to gamma-rays when considering the PIC-container for radioactive wastes. The radiation-resistance of PIC with test piece was evaluated by irradiation with gamma-rays. The specimens impregnated by MMA (methylmethacrylate) monomer and a solution of 10% of PS (polystyrene) in MMA monomer (MMA:PS) were polymerized by irradiating for 5 hr at the dose rate of 1 MR (1×10^6 Roentgen)/hr. PIC specimens were exposed up to maximum 1000 MR to ^{60}Co gamma-rays in air and under water. This simulates shallow land disposal and deep sea dumping conditions, respectively. (14 refs.)

76504 Irradiation induced order-disorder in Ni_3Al and NiAl . H.C.Liu, T.E.Mitchell (Dept. of Metall. & Materials Sci., Case Western Reserve Univ., Cleveland, OH, USA).

Acta Metall. (USA), vol.31, no.6, p.863-72 (June 1983). Irradiation induced order-disorder phenomena in $\gamma\text{-Ni}_3\text{Al}$ and $\beta\text{-NiAl}$ have been investigated by high voltage electron irradiation at temperatures from 10 to 470 K. In Ni_3Al , at $T \leq 190$ K irradiation creates a completely disordered structure by 1 dpa. At $T \approx 200$ -240 K, a residual state of order with $S \approx 0.1$ -0.15 is created by about 2 dpa, and disordering rates are found to be temperature dependent. Irradiation-enhanced re-ordering through an interstitial mechanism is a likely explanation in this temperature regime. At $T \geq 250$ K, intermediate degrees of order with $S \geq 0.2$ are produced by irradiation. The degree of order in Ni_3Al increases with increasing irradiation temperature and re-ordering through the migration of vacancies is apparently more effective than the migration of interstitials. NiAl , CoAl and NiGa still maintain partially-ordered states even after irradiation at 10 K (150 K for NiGa) to 3 dpa. The effect of crystallographic orientation on disordering rates suggests that 'wrong' recombination of point defects is the more likely disordering mechanism at lower voltage irradiations and the replacement collision sequence mechanism becomes important at higher voltage irradiations. (38 refs.)

76505 Helium bubble growth during 1 MeV electron irradiation at 300 K in 5 keV- He^+ pre-implanted nickel and an amorphous Fe-Ni-Mo-B alloy. H.van Swygenhoven, L.M.Stals, G.Knuyt (Limburgs Univ. Centrum, Diepenbeek, Belgium).

Radiat. Eff. Lett. Sect. (GB), vol.76, no.1-2, p.29-41 (1983). The influence of 1 MeV electron irradiation at 300 K on the diameter distribution of helium bubbles after 5 keV He^+ implantation in nickel and in Metglas 2826 MB ($\text{Fe}_{40}\text{Ni}_{30}\text{Mo}_4\text{B}_{26}$) is investigated. Electron irradiation induces additional bubble growth in both materials. Helium bubble growth in nickel as a function of damage dose (2-18 dpa) is as effective during e^- irradiation of a He^+ pre-implanted specimen as it is during further He^+ implantation. This indicates that a significant proportion of the implanted helium resides outside the bubbles after He^+ implantation and that this helium precipitates into the bubbles during electron irradiation. In the amorphous alloy, the helium bubbles grow less during electron irradiation than during further He^+ implantation. (14 refs.)

76506 Radiation effects on MOS devices: dosimetry, annealing, irradiation sequence, and sources. E.G.Stassinopoulos, G.J.Brucker (NASA/Goddard Space Flight Center, Greenbelt, MD, USA), O.Van Gunten, A.R.Knudson, T.M.Jordan.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.3, p.1880-4 (June 1983). The authors report investigations of dosimetry, annealing, irradiation sequences, and radioactive sources, involved in the determination of radiation effects on MOS devices. Results show that agreement in the experimental and theoretical surface to average doses support the use of thermo-luminescent dosimeters (manganese activated calcium fluoride) in specifying the surface dose delivered to thin gate insulators of MOS devices. Annealing measurements indicate the existence of at least two energy levels, or activation energies, for recovery of soft oxide MOS devices after irradiation by electrons, protons, and gammas. (12 refs.)

76507 Megavolt electron irradiation induced regrowth of amorphous zones in silicon. J.Washburn, D.K.Sadana (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2380-2 (May 1983). Deep buried amorphous layers were created in (100)Si by 11-MeV As^+ implantation. The effect of 1.2-MeV electron irradiation at the upper and lower surfaces of the buried layer was investigated in thin cross-section specimens prepared for transmission electron microscopy. It was found that in partially amorphous silicon amorphous zones (≤ 100 Å) imbedded in crystalline matrix shrank during the irradiation. On the basis of these results and earlier published data, the mechanism of the crystal to amorphous transformation has been discussed. (10 refs.)

76508 Microstructural transitions in Pt-C alloys during high-voltage-electron-microscope irradiation. P.G.Regnier, N.Q.Lam (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA), K.H.Westmacott. *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.286-96 (April 1983).

Radiation-induced microstructural changes in Pt-C alloys under irradiation inside a high-voltage electron microscope were investigated as a function of energy and temperature. Electrons of energy > 380 keV can displace C atoms from the monolayer carbon platelets previously created by co-precipitation of C and vacancies on {100} planes. The collapsed vacant sites left behind in the platelets by this direct displacement process amalgamate after a certain incubation dose. At higher energies, > 560 keV, the electrons can impart a considerable energy to the C atoms, which, in turn, become sufficiently energetic to displace the Pt atoms via secondary C-Pt collisions. Consequently, in these energy regimes, significant changes in the alloy microstructure, such as stimulated precipitate coarsening and formation of interstitial loops in the matrix, take place, even though the incident electrons have energies far below the displacement threshold of the matrix element (~ 1.3 MeV). The incubation doses for the formation of visible defect clusters inside the C precipitates and in the matrix were measured and fitted to simple analytical formalisms. The present work indicates the importance of accounting for secondary-collision processes in the assessment of radiation damage in alloys in which the alloying elements are drastically different in atomic mass. (26 refs.)

76509 Electron damage in zirconium. I. Defect structure and loop character. M.Griffiths, M.H.Loretto, R.E.Smallman (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.313-22 (April 1983). Zirconium ($\geq 99.95\%$ Zr) has been irradiated using 1 MeV electrons at temperatures between 273 and 773 K in a high-voltage electron microscope and the nature of the clustered damage assessed. It has been shown that both interstitial and vacancy loops of $b = \frac{1}{2}(1120)$ nucleate and grow during electron irradiation within this temperature range. Some loops of $b = \frac{1}{2}(1123)$ and $\frac{1}{6}(2023)$ are also observed. The significance of the observation of vacancy loops is discussed in terms of current theories of defect clustering during irradiation and it is concluded that the presence of imposed stress influences the clustering. (21 refs.)

76510 Electron damage in zirconium. II. Nucleation and growth of c-component loops. M.Griffiths, M.H.Loretto, R.E.Smallman (Dept. of Metall. & Materials, Univ. of Birmingham, Birmingham, England).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.323-30 (April 1983). For Pt-I see *ibid.*, vol.115, p.313-22 (1983). Interstitial loops of $b = \frac{1}{2}(1123)$ have been observed to nucleate and grow during HVEM electron irradiation of Zr at temperatures ~ 650 K. Observations suggest that nucleation and early growth of these loops takes place on a combination of {1011} and {1010}

planes. Subsequent glide of the glissile $\frac{1}{3}(11\bar{2}3)$ dislocations produces irregular loops which lie on irrational planes and are frequently chair-shaped. Of the six possible $\{1011\}$ planes there are only two for which nucleation of these loops is observed in foils having normals close to (1210) . These observations and observations of perfect (a) type vacancy and interstitial loops have been interpreted in terms of the stress imposed in the Zr foil by the oxide formed during in situ irradiation at high temperature. The observations are discussed in terms of radiation-induced growth. (18 refs.)

76511 Temperature dependence of the threshold energy for atom displacement in irradiated molybdenum. W.Zag, K.Urban (Inst. fur Phys., Max-Planck-Inst. fur Metall., Stuttgart, Germany). *Phys. Status Solidi A (Germany)*, vol.76, no.1, p.285-95 (16 March 1983). The effective threshold energy for atom displacement is measured in molybdenum single crystals in a high-voltage electron microscope. Displacement is monitored at $70\text{K} \leq T \leq 300\text{K}$ by observing the nucleation of interstitial dislocation loops and at $500\text{K} \leq T \leq 800\text{K}$ by measuring the growth rate of previously induced loops. By use of reference irradiations the results of both methods may be calibrated to allow comparison over the whole temperature range covered. At $70\text{K} \leq T \leq 150\text{K}$ the effective threshold energy for irradiation along a $\langle 100 \rangle$ -direction is found to have a constant value of (34.5 ± 0.5) eV. Above this range the threshold energy decreases continuously with temperature to (26.5 ± 0.5) eV at 800K . The role of subthreshold processes is discussed. It is found that such processes contribute little to the displacement cross section. The observed temperature dependence of the displacement threshold energy is explained in terms of the effect of thermal vibrations on the production of stable Frenkel pairs. (32 refs.)

76512 The temperature dependence of the threshold displacement energy in MgO. G.P.Pells (Metall. Div., AERE Harwell, Didcot, England). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.71-5 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). The threshold voltage at which visible defects could be produced in MgO by electron irradiation in a HVEM has been determined over a wide range of temperature for the $\langle 001 \rangle$ and $\langle 111 \rangle$ directions. In a separate experiment, the growth of oxygen vacancy centres produced by electron irradiation along $\langle 001 \rangle$ at 90K was followed by optical absorption measurements for several energies between 325 kV and 500 kV . The oxygen vacancy growth measurements gave an upper limit to the threshold voltage of 300 kV which is equivalent to a value of the threshold displacement energy E_d for oxygen of 53 eV . The HVEM measurements over the temperature range $125\text{--}1070\text{K}$ gave an effective threshold voltage which varied considerably with temperature. The effective threshold at room temperature and below occurred at 460 kV which is considerably higher than the optically determined oxygen threshold and must therefore correspond to the magnesium threshold. This gives a value of E_d for magnesium of $60 \pm 3\text{ eV}$ for all three directions. At higher temperatures the effective threshold voltage fell to give minima at $\sim 700\text{K}$ for each of the three orientations. Comparison with the optical measurements suggests that the minima are the thresholds for oxygen displacement. It is proposed that the decrease in the effective threshold is a defect mobility effect which allows dislocation loops to be formed from the displaced oxygen ions only. The minima at 700K would therefore correspond to values of E_d for oxygen of $44 \pm 3\text{ eV}$ for $\langle 001 \rangle$, $64 \pm 3\text{ eV}$ for $\langle 011 \rangle$ and $46 \pm 3\text{ eV}$ for $\langle 111 \rangle$. At higher temperatures for $\langle 001 \rangle$ and $\langle 011 \rangle$ the effective thresholds rose to a peak at $\sim 900\text{K}$ of 340 kV and 410 kV respectively. (12 refs.)

76513 Modifications of sodium concentration profiles after electron and proton irradiation of glasses. G.Battaglin, G.Della Mea, G.de Marchi, P.Mazzoldi (Istituto di Fisica, GNSM-CNR, Padova, Italy), O.Puglisi. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.99-102 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). The authors studied the effect of electron and proton irradiation on the depth distribution of sodium in commercial soda-lime glasses. Samples have been irradiated at different energies and fluences. The ^{23}Na (p, α) ^{20}Ne nuclear reaction has been used to determine the sodium profiles. No detectable changes in the sodium concentration profiles have been introduced during the measurements, the proton fluences and doses needed in this type of analysis being very low. The obtained results support the hypothesis that the driving force for Na diffusion is mainly connected to the build-up of an electric field whose direction is determined by the projectile charge, while Na mobility changes because of the local temperature increase due to the beam power dissipation. (17 refs.)

76514 Electron and ion beam effects in Auger electron spectroscopy. G.Pignatelli, G.Queirolo (SGS/ATES Componenti Elettronici SpA, Milan, Italy). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.109 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Summary form only given. Reports some observations on the electron and ion beam interactions on some of the insulating and conducting films used in silicon device technology. Among the materials considered, silicon nitride and P-doped silicon dioxide are of primary interest, and will be treated in some detail; results on other films, both insulating (Al_2O_3 , B-doped SiO_2 , etc.) and conducting (Al-Si alloys) will also be reported. The results show that much care has to be taken when performing or interpreting the AES data, and how to use, in some cases, the electron beam irradiation effects to increase the sensitivity of the method. (no refs.)

76515 Electric field effects on radiation defects annealing in p-InP. A.Sibille (CNET, Bagnex, France). *Solid State Commun. (USA)*, vol.46, no.9, p.673-5 (June 1983). The author has performed annealing experiments on electron irradiated Schottky diodes on p-InP. They show a strong influence of the applied reverse bias during annealing on the recovery of the free hole concentration, as well as on the disappearance of the dominant radiation induced hole traps detected by deep level transient spectroscopy (DLTS). Compensating defects are observed to drift under the action of the electric field and accumulate at the edge of the depleted zone, while the main hole traps created by the irradiation anneal faster when empty of holes or subjected to an electric field. (10 refs.)

76516 Effect of 5.5-MeV electron bombardment on the high-temperature mechanical properties of nickel. V.L.Arbuzov, S.N.Votinov, A.A.Grigor'yan, S.E.Danilov, S.M.Klotsman (Inst. of Metall. Phys., Acad. of Sci., Sverdlovsk, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.641-2 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1120-1 (Aug. 1982). [received: May 1983] Reports a study of the high-temperature radiation embrittlement of nickel-based alloys under conditions such that the production of helium due to nuclear reactions is eliminated, and the redistribution of impurities under

bombardment results from macroscopic flows of point defects (inclusions and vacancies) into sinks of the dislocation and grain-boundary type. (4 refs.)

76517 Swelling in cold-deformed OKh16N15M3B steel on irradiation in a high-voltage electron microscope. M.M.Kantor, V.N.Kolotinskii, I.I.Novikov, A.G.Ioltukhovskii, V.K.Vasil'ev, N.Yu.Zav'yalova. *Sov. At. Energy (USA)*, vol.53, no.3, p.633-7 (Sept. 1982). Translation of: *At. Energy. (USSR)*, vol.53, no.3, p.167-71 (Sept. 1982). [received: May 1983] Previous cold deformation greatly reduces the swelling of austenitic steel on neutron irradiation at $400\text{--}650^\circ\text{C}$. It has been found that the reduced swelling in cold-deformed steels of types 316 and OKh16N15M3B is due to reduction in the growth rates of the pores, whose mean size decreases as the degree of deformation rises. The authors study the effects of cold deformation in OKh16N15M3B and outline experimental methods used. (13 refs.)

61.80H Neutrons

76518 A new calculation of thermal neutron damage and helium production in nickel. L.R.Greenwood (Chem. Engng. Div., Argonne Nat. Lab., Argonne, IL, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.137-42 (April 1983). It has long been recognized that thermal neutron irradiations of nickel-bearing materials generate high levels of helium from the sequential $^{58}\text{Ni}(n, \gamma)^{59}\text{Ni}(n, \alpha)^{56}\text{Fe}$ nuclear reactions. This process is used to simulate fusion reactor helium-to-displacement damage rates in stainless steel during fission reactor irradiations. However, it has not previously been recognized that the ^{56}Fe recoils will also cause significant displacement damage. At thermal neutron energies the $340\text{ keV } ^{56}\text{Fe}$ recoil event will displace 1762 atoms in nickel. The helium (appm)-to-displacement ratio from this process will be 567, a value that can be used to correct previous displacement calculations in nickel-bearing materials. This effect can nearly double the displacement damage in nickel in HFIR at high neutron fluences. (7 refs.)

76519 Effect of neutron irradiation on the deformation of copper and internally oxidized copper-aluminium alloy. H.R.Higgy (Hot Lab., Atomic Energy Establ., Cairo, Egypt).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.307-12 (April 1983). The effect of neutron irradiation on the deformation of pure copper and of internally oxidized Cu-0.09 wt.% Al alloy was studied. Single crystals of different orientation were grown from pure copper and Cu-0.09 wt.% Al rods, and the alloy crystals were internally oxidized. Tensile specimens were prepared from the crystals, and were irradiated to a neutron fluence of $5.5 \times 10^{19}\text{ n/cm}^2$ ($E > 1\text{ MeV}$) at a temperature below 70°C . All control and irradiated specimens were tensile-tested. The addition of second-phase particles was found to have considerable effect on the deformation of irradiated copper. The increase in critical resolved shear stress was less in internally oxidized Cu-0.09 wt.% Al (Cu- Al_2O_3) than in pure copper, while the change in ultimate shear stress and shear strain was much less. Yield point phenomena appeared in all crystals, but the drop in shear stress at the yield point was less in Cu- Al_2O_3 . Two values of work-hardening coefficient (n) appeared in all unirradiated crystals, the first, a slightly larger one, was substantially decreased by irradiation, while the second was nearly unchanged. The decrease in n by irradiation was considerably larger in Cu- Al_2O_3 . (18 refs.)

- 76520** Investigations of two-level tunneling systems in n-irradiated quartz by diffuse X-ray scattering. D.Grasse, O.Kocar, J.Piesl (Sektion Phys., Univ. der Munchen, Munchen, Germany), S.C.Moss. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.233 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Recent observation of the acoustic saturation and of phonon echoes in crystalline quartz after light irradiation with fast neutrons indicates that there are the same low-energy atomic tunnelling systems as in SiO₂ glass. The authors report measurements of the diffuse X-ray scattering and of the lattice parameter change from neutron irradiated quartz single crystals studying the strength and symmetry of strain defects and their local correlations. For dose 3×10^{18} n/cm² the diffuse scattering close to the Bragg peaks together with the lattice parameters change shows that the neutrons create defective regions with a volume change of 29 mean atomic volumes. The distortion field of these regions shows no high symmetry. The radius of the heavily strained region is ~ 10 Å. For higher doses the regions grow a little bit but mainly new defective regions are built. According to the various volume fractions of defective regions at various doses the first strong amorphous halo at about $K \approx 1.5 \text{ Å}^{-1}$ was detected. Since this amorphous scattering is isotropic and during annealing the regions disappear mainly without changing their size they are led to the conclusion that the defective regions are glass-like in nature. So the size of the tunnelling system has to be smaller than 20 Å. (no refs.)

61.80J Ions

(for ion implantation, see 61.70T)

- 76521** The effect of implanted helium on the high temperature mechanical properties of a model austenitic Fe-17% Cr-17% Ni alloy. H.Schroeder (Inst. fur Festkörperforschung, KFA Jülich, Jülich, Germany), D.N.Braski. *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.297-306 (April 1983). Foils of the ternary alloy Fe-17 wt% Cr-17 wt% Ni were cyclotron-implanted with 160 appm helium and then creep rupture tested at 1023K together with unimplanted controls. The range of the applied stress was 9.8 MPa till 39.2 MPa. In addition, a few tensile tests ($\dot{\epsilon} = 1.5 \times 10^{-3}$ /s) were performed with implanted and unimplanted specimens at the same temperature. The mechanical properties of the material are changed by the presence of helium—characteristically for high temperature helium embrittlement: reduced ductility, reduced creep rupture time, increased yield stress (matrix hardening) and intergranular fracture. The changes in the mechanical properties are accompanied by a change in the deformation mode from 'climb and glide' (mixed with some grain boundary sliding) in the unimplanted samples to predominantly grain boundary sliding in the helium implanted ones. This can be correlated with high densities of helium bubbles in grain boundaries. Initiation of grain boundary cracks seems to be strongly influenced by very large helium bubbles at grain boundary triple point junctions. (14 refs.)
- 76522** The effect of He-irradiation on the fracture toughness of ThO₂. H.Matzke, J.L.Routbort (Joint Res. Centre, Karlsruhe Establ., Karlsruhe, Germany). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.334-6 (April 1983). The effect of irradiation with doubly charged He²⁺ ions (α -particles) is reported. The results show that the irradiation of ThO₂ with high energy He-ions does not cause premature fracture, as reported by Clinard and Rohr (1981) for self-irradiated PuO₂, but rather causes radiation hardening. The fracture toughness increases by up to 25%. (19 refs.)
- 76523** Radiation damage in ion-implanted quartz crystals. Part I: Nuclear and electronic energy deposition. H.Fischer, G.Gotz, H.Karge (Sektion Phys., Friedrich-Schiller-Univ., Jena, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.249-56 (16 March 1983). The disorder formation in quartz crystals by implantation of He⁺, B⁺, and Ar⁺ ions at room temperature is investigated by Rutherford-backscattering spectrometry (RBS). The efficiency of the process of damage production is strongly dependent on the energy deposition mechanism and the degree of disorder. Three characteristic stages of defect formation are found in dependence on nuclear deposited energy density G_n : (I) Point defects are produced at $G_n \leq 1 \times 10^{20}$ keV/cm³. (II) Amorphous microregions are generated up to the formation of a quasi amorphous layer (termed 'RBS-amorphous') at $G_n \approx 2.5 \times 10^{20}$ keV/cm³. (III) Further structural changes occur in RBS-amorphous layers at larger G_n values. Disorder formation due to electronic processes is possible, but only in predamaged quartz, and at a very low efficiency. (16 refs.)
- 76524** Anomalous defect interaction and amorphization during self-irradiation of Si crystals at 450K. J.Belz, K.F.Heidemann, H.F.Kappert, E.Te Kaat (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K81-4 (16 March 1983). 2 MeV Si²⁺ irradiation of silicon crystals with sufficiently high doses leads to amorphization at temperatures up to 400K. The authors report the results of optical and electron microscopical investigations which show that the dose dependence of the defect production at irradiation temperatures above 400K is determined by extreme defect interaction processes resulting in recombina-

tion and cluster formation of point defects (5×10^{13} to 5×10^{15} cm⁻²) and formation of stacking faults and dislocations (5×10^{15} to 3×10^{17} cm⁻²). The final amorphization represents a new mechanism originating from a dense dislocation network. (7 refs.)

- 76525** Repulsive potentials and nuclear stopping in ionic insulators. J.P.Biersack (Hahn-Meitner-Inst. fur Kernforschung Berlin GmbH, Berlin, Germany), M.Stadele. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.51-60 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). In ionic crystals or other insulators with partial ionic binding, the ion-target interaction differs from that of neutral atoms due to different electronic distributions and overall electrical charges. Consequently, the nuclear stopping power and defect production by recoiling atoms will deviate from standard values, obtained from e.g. Moliere potentials. Realistic potentials between the projectile ion and target ion are determined by the free electron gas model of overlapping Hartree-Fock-Slater or Lenz-Jensen ions (and neutral atoms for comparison). With the new potentials, the transferred energies T and the range of interaction are determined for either damage production ($T > E_d$) and for nuclear stopping ($T > h\nu$ for bound ions). In addition the excitation of optical phonons is taken into account which are excited by the transient electrical field of the charged projectile. (12 refs.)
- 76526** Assessment of damage ranges by measurements of the refractive index in ion implanted LiNbO₃ and LiTaO₃. A.Faik, P.G.Dawber, D.J.O'Connor, P.D.Townsend (School of Math. & Phys. Sci., Univ. of Sussex, Falmer, Brighton, England). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.235-40 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Ion implantation in LiNbO₃ and LiTaO₃ produces radiation damage by nuclear collisions. The amorphisation of the lattice reduces the refractive index of the material. In the case of fast ion bombardment with helium this damage layer is buried below the surface. The refractive index profile which then exists a suitable for an optical waveguide on the surface which supports several modes. Analysis of the refractive index profile yields the damage distribution in the crystal and this in turn can be compared with theoretical estimates of the damage production and ion ranges. The analyses show that in the high energy range from 0.5 to 2.0 MeV the depth of the damage is predominantly controlled by the electronic stopping. (16 refs.)

61.80L Atoms and molecules

- 76527** Computer simulation of collision cascades in monazite. M.T.Robinson (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5347-59 (1 May 1983). Collision cascades in the monoclinic mineral monazite have been studied with a modified version of the computer-simulation program MARLOWE. Most of the calculations were made for the irradiation of polycrystalline CePO₄ by normally incident 50-eV to 100-keV Ar atoms. A few calculations were made for 1-keV Cu atoms recoiling from lattice sites in a hypothetical form of Cu with the monazite structure. Although there are many fewer replacements and substantially more channeling in the mineral, collision cascades in monazite are generally similar to those in metals in size and shape. The dimensions of the calculated cascades suggest that the amorphization of monazite by Ar-ion irradiation probably commences when collision cascades begin to overlap. The calculations give a detailed view of the structure of the cascades in monazite that should be useful in interpreting radiation effects in proposed nuclear-waste isolation media. (41 refs.)

61.80M Channelling, blocking and energy loss of particles

(see also 29.70 Energy loss and range relations)

76528 On anomalies in the ionization probability of the fast atomic particles in crystals. V.A.Bazylev, A.V.Demura (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.1-2, p.13-17 (1983). The anomalous dependence of the ionization probability of fast atomic particles during channelling in crystals on the angle between the direction of the particle momentum and crystallographic axes is predicted. (3 refs.)

76529 The influence of the planar potential form on the channelling radiation spectrum. Yu.I.Dudchik, F.F.Komarov (Inst. of Appl. Phys. Problems, Belorussian Univ., Minsk, Belorussian SSR). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.3, p.61-5 (1983). Energies for transitions between bound states for planar-channeled electrons are calculated. The continuum planar potential constructed from atomic ones in the Molier and Hartree-Fock-Slater approximation are used. It is shown that the H-F-S line energies calculations are in a good agreement with the experimental data for diamond. (14 refs.)

76530 Electromagnetic radiation of quasicchannelling positrons. V.V.Beloshitsky, Yu.A.Bykovsky, M.H.Kumekhov (Moscow Engng. Phys. Inst., Moscow, USSR). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.3, p.93-100 (1983). The contribution of quasicchannelling positrons to the channelling radiation spectrum is studied in the general case with the account of the dechannelling and nondipole character of the radiation at high energies. Limits of the dipole approximation are studied depending on the positron energy and the tilt angle of the crystal. Theoretical results show good agreement with experiments on diamond and silicon for 10-GeV positrons at different tilt angles. (10 refs.)

76531 Undulator radiation of relativistic electrons in a polydomain ferro-magnetic. G.M.Genkin, V.V.Zil'berberg (Inst. of Appl. Phys., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol.36, no.9, p.408-11 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.334-6 (5 Nov. 1982). [received: June 1983] The radiation emitted by a relativistic electron moving in a ferromagnet perpendicular to the magnetization axis is studied. Some possibilities for controlling the radiation frequency are examined. Under certain conditions this radiation has both a higher power and a higher photon energy than the radiation of a channeled particle. (6 refs.)

76532 Experimental observation of volume capture by a curved single crystal in the channelling regime. V.A.Andreev, V.V.Baublis, E.A.Damaskinski, A.G.Krivishch, L.G.Kudin, V.V.Marchenkov, V.F.Morozov, V.V.Nelyubin, E.M.Orishchin, G.E.Petrov, G.A.Ryabov, V.M.Samsonov, L.E.Samsonov, E.M.Spiridenkov, V.V.Sulimov, O.I.Sumbayev, V.A.Shechel'skii (B.P. Konstantinov Inst. of Nuclear Phys., Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.9, p.415-19 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.340-3 (5 Nov. 1982). [received: June 1983] It is shown for the first time that a curved single crystal can capture particles in the channelling regime for angles exceeding the Lindhard angle. 1-GeV protons were captured during channelling by (111) and (110) planes and by (110) axis along the entire length of a 1-cm silicon single-crystal curved along a radius of 46 cm in the entire angular range up to 20 mrad. (4 refs.)

76533 Computer simulations of slowing down of heavy ions in polycrystalline materials. M.Hautala (Dept. of Phys., Univ. of Helsinki, Helsinki, Finland). *Phys. Lett. A (Netherlands)*, vol.95A, no.8, p.436-8 (23 May 1983). A fast computer code is constructed to simulate the slowing down of ions in crystalline materials. The programme is used to study the range distributions of 120 keV Pb in polycrystalline Al and 60 keV Al in polycrystalline Ta. Good agreement with experiment is found, when partial preferred orientation of the microcrystals is assumed. (9 refs.)

76534 Energy losses in crystalline and amorphous solids in the intermediate energy region. E.Kuhrt, R.Wedell (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.585-95 (1 April 1983). Using the classical theory for two moving charged particles the electronic stopping power of amorphous and random oriented crystalline solids is calculated. It is shown that in the intermediate energy region, where the stopping is maximized, motion of the target electrons must be considered. The specific problems of energy losses in crystals are discussed and directional effects are taken into account. Calculated values of the stopping power agree well with experimental results for protons in the random as well as in the channelling regime. (38 refs.)

76535 Molecular-type channelling of relativistic electrons in crystals. E.G.Vyatkin, Yu.M.Filimonov, A.M.Taratin, S.A.Vorobiev (Inst. of Nuclear Phys., Tomsk Polytech. Inst., Tomsk, USSR). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.41-50 (1 May 1983). Channelling of relativistic electrons in (110) direction in a diamond crystal and the channelling radiation spectra are investigated using computer simulation by the binary collision model and using the model of a continuum potential of the atomic rows. In a computer experiment the atomic- and molecular-type states of channeled electrons are revealed, and the orientational dependence of the electron trapping probability in these states is obtained. The peculiarities revealed of the angular distributions and radiation spectra of electrons in the molecular-type states should make it possible to discover these states experimentally. (9 refs.)

76536 Study of various approximations for the continuum planar potentials at channelling. I. Monoatomic crystals. G.V.Dedkov (Phys. Dept., Karbadio-Balkarian State Univ., Nalchik, USSR). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.57-66 (1 May 1983). A detailed analysis of different approximations for the continuum planar potentials under channelling conditions is given. The continuum potentials for positrons (electrons) channeled in (110) and (100) planes in crystals of diamond silicon, and tungsten are calculated in different approximations to the screening function. The model of an atom with a piecewise exponentially decaying electron density is discussed. The influence of the thermal vibrations and the atomic shell structure on the potentials is investigated. Some estimates of the photon energy radiated at channelling of 56 MeV electrons in (110) planes of C are given. (14 refs.)

76537 Experimental energy-loss function, $\text{Im}[-1/\epsilon(q,\omega)]$, for aluminium. P.E.Batson, J.Silcox (School of Appl. & Engng. Phys., Cornell Univ., Ithaca, NY, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5224-39 (1 May 1983). The authors describe highly accurate (0.2-1%) intensity measurements for the inelastic scattering of 75-keV electrons in $\sim 1000\text{-\AA}$ -thick polycrystalline aluminum films in the region of $(0.0\text{-}3.1)\text{-\AA}^{-1}$ transferred wave vector and (0-100)-eV energy loss. The work was performed on the Cornell University electron spectrometer-microscope-computer system. These measurements clarify some experimental problem associated with multiple scattering which obscure the single scattering distribution. They present a new method for eliminating the distribution of intensity attributable to multiple scattering involving quasielastic events. This subtraction method is accurate to $\sim 0.01\%$ of the single-bulk-plasmon intensity. Next, they extend an earlier correction method to obtain the single scattering energy-loss function $\text{Im}[-1/\epsilon]$ from the residue to the first process, which consists of multiple plasmons and quasiparticle transitions. Details of the specific procedures are included. They point out several features in the result—the bulk-plasmon intensity, dispersion, and width, the quasi-particle continuum, and a simultaneous two-plasmon scattering. The latter is, for the first time, characterized completely as to intensity, dispersion, and energy width. Finally, they present a comparison of the measured bulk-plasmon dispersion with some recent model calculations. (50 refs.)

76538 Range calculations for high-energy heavy atoms in complex media. W.Westmeier, K.Rossler (Inst. für Kernchemie, Lahnberge, Marburg, Germany). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.61 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Summary form only given, as follows. The computer code MARLOWE was used to evaluate energy vs. range curves in the binary collision approximation. The program was extended to the high-energy regime taking into account the stripping of electrons from the projectile and the concomitant changes in the interaction potentials especially for the inelastic part of the collisions. A complementary computer code LATTIC was developed for the parameterization of the lattice description. This code enables the application of MARLOWE to target materials with complicated crystallographic structure, such as, e.g. ThF_4 , KClO_4 and NH_4Cl . Test calculations for a series of projectile/target combinations showed a reasonable agreement with experimental recoil ranges of Pd, Ag, Os, and Ir isotopes from proton induced spallation in different targets. These calculations also indicate that density effects, i.e. the reduction in the ionization loss of fast charged particles due to the dielectric polarization of the medium, seem to be of minor importance for particle velocities below $\beta=0.01$. (no refs.)

76539 Interaction of charged particles and local modes. J.Janszky (Res. Lab. for Crystal Phys., Budapest, Hungary), Yu.Ya.Yushin. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.171-3 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). By means of the coherent states technique the interaction of local modes of imperfections in alkali halide crystals with charged particles emerging from an ion avalanche is investigated. The energy obtained by an imperfection and that lost by a particle on unit way due to the interaction are evaluated. Part of the excess energy of the mode relaxes through phonon processes, a smaller part of the energy is emitted by the crystal on the local mode frequency. This way during the interaction the local mode emits infrared radiation; an estimate is given concerning the intensity of this radiation. This intensity has a well-defined peak at the velocity of particles being in resonance with the local mode frequency. Using different local centres some information can be obtained about the velocity distribution of particles inside the crystal during irradiation. (4 refs.)

76540 The importance of ionization and displacement damage to the crystalline-amorphous transformation observed in quartz. D.G.Howitz, J.F.DeNatale (Dept. of Mech. Engng., Univ. of California, Davis, CA, USA). *Radiat. Phys. & Chem. (GB)*, vol.21, no.5, p.445-9 (1983). A radiolytic yield and an average displacement damage cross section are calculated for quartz based upon recent ion, neutron and electron irradiation studies. (27 refs.)

76541 Stimulated emission by charged particles in natural hollow crystalline channels. V.I.Vysotskii, R.N.Kuz'min (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2120-1 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3718-20 (Dec. 1983). It has been conjectured that stimulated emission of X-rays and gamma rays can occur due to resonance transitions of relativistic electrons between levels of the transverse motion of electrons during their channelling in crystals. The authors propose a qualitatively new model of coherent amplification in the interval $\lambda \approx 1\text{-}10\text{ \AA}$ based on the quantum motion of relativistic positrons in natural hollow rectilinear cylindrical channels of radius $R \approx 4\text{-}40\text{ \AA}$. The required system of such channels can be found in aluminosilicate crystals (zeolites such as mordenite, gmelinite, offretite, etc.) with $R \approx 4\text{ \AA}$ and asbestochrysotile packets with $R \approx 40\text{ \AA}$. (5 refs.)

76542 Scaling of the band structure of channelized particles. I.D.Feranchuk, B.A.Chevganov (V.I. Lenin State Univ., Minsk, Belorussian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1397-8 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2276-8 (Nov. 1982). [received: May 1983] The authors show that the dependence of the energy band spectrum of relativistic channeling particles on the longitudinal energy and on the amplitude and period of the interplane potential is of a universal character. It is therefore possible to find the particle energy levels for different potential parameters and longitudinal energies using a single 'standard' band spectrum. The authors describe an effective method for calculating energy bands for particles channelling in a plane and construct some 'standard' spectra. (5 refs.)

62.20D Elastic constants

(see also 03.40D *Mathematical theory of elasticity*, 81.40J *Elasticity and anelasticity*)

- 76543 Temperature dependence of elastic stiffness C_{11} in LiNbO_3 . I.Tomeno, S.Matsumura (Toshiba Res. & Dev. Center, Toshiba Corp., Kawasaki, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1515-17 (May 1983). The elastic stiffness C_{11} of a single domain LiNbO_3 crystal (C_{11}^E) and that of a multidomain crystal (C_{11}^D) were measured by the ultrasonic phase comparison method in the temperature range between 300 and 1223K. The stiffness C_{11}^D was about 2% larger than C_{11}^E at room temperature and both decreased linearly with increasing temperature. The results indicated that the spontaneous polarization P_3 was approximately constant in the temperature range described. (19 refs.)
- 76544 The variation of elastic constants of nickel-iron single crystal alloys from 78.76 to 300K. A.Kanrar, U.S.Ghosh (Dept. of Magnetism, Indian Assoc. for the Cultivation of Sci., Calcutta, India). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.457-62 (1983). The temperature dependences of three independent adiabatic elastic stiffness coefficients C_{11} , C_{12} and C_{44} of four Ni-Fe single crystal alloys with compositions from 50 to 90 wt.% of Ni have been studied by the ultrasonic pulse superposition technique from 78.76 to 300K. The elastic constants of the alloys exhibit normal temperature dependencies in the range of temperature investigated. A good fit of the experimental data to Lakkad's phenomenological model (1971) for the temperature dependence of elastic constants was obtained. (14 refs.)
- 76545 Dependence of the Poisson ratio on the electron-phonon interaction constant. A.S.Balankin (Engng.-Phys. Inst., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2102-3 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3689-90 (Dec. 1983). The interaction of electrons with lattice vibrations via the deformation potential leads to a renormalization of the elastic moduli which must clearly give rise to a dependence of the Poisson ratio on the electron-phonon interaction constant. The author studies this dependence by solving the elasticity equations, including the deformation interaction of electrons with lattice vibrations, in conjunction with the Maxwell equations and the transport equation for conduction electrons for the case of an isotropic metal and using the Frohlich model of the electron-phonon interaction. (9 refs.)
- 76546 Temperature dependence of the elastic modulus of polymer glasses. A.B.Sinani, V.A.Stepanov, I.I.Timoshenko (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.441-2 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1025-9 (Sept. 1982). [received: May 1983] The authors show that the temperature dependence of the elastic moduli of polymer glasses has a twofold nature: On the one hand, a relaxation of the modulus associated with a change in the mobility of the various molecular groupings. On the other hand, the modulus is affected by anharmonic effects, characteristic of any condensed system and particularly strong in the case of a weak intermolecular interaction. The contribution of the second mechanism is extremely important in polymer glasses, indicating that the forces determining the elastic behavior are of an intermolecular nature. (6 refs.)

- 76547 Measurement of elastic moduli of small specimen by means of rectangular parallel piped resonance method. T.Goto (Dental Material & Technol., Gifu Coll. of Dentistry, Gifu, Japan), N.Soga. *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.1, p.24-31 (1983). The rectangular parallelepiped resonance method was used for measurements of the elastic constants and their temperature dependences for SiO_2 glass and MgO single crystals with about 2 mm in edge length. It was found that (1) even a small specimen of 2 mm size could be used, (2) sample preparation was quite easy as compared with the ultrasonic technique, (3) the resonant frequency necessary for the measurement was low, and (4) the temperature dependences of elastic constants on both isotropic and nonisotropic solid could be obtained accurately by measuring the relative changes of resonant frequencies from the room temperature values, if the force imparted to the specimens was kept constant during the measurement of temperature variation. 62.20F Deformation and plasticity

(inc. yield, ductility and superplasticity; see also 81.40L *Deformation, plasticity and creep*)

- 76548 Analysis on plasticity in materials with strain hardening and strain-rate sensitivity under uniaxial tension. Lian Jianshe. *Chin. J. Mech. Eng. (China)*, vol.18, no.4, p.21-30 (Dec. 1982). In Chinese. [received: May 1983] For the analysis of plastic flow and necking development of materials with both work hardening and strain-rate sensitivity under uniaxial tension, it is proved that the basis of Hart's analysis (1967) is the same as Hutchinson et al.'s analysis (1977) based on the constitutive law ($\sigma = K\dot{\epsilon}^m$). Based on Hart's analysis, the flow-stability and the criterion of stability of Hart and Jonas et al. (1976, 1977) are discussed. Also, considering the initial geometric imperfection ($\alpha(0)$), the incremental and the integral analysis are given for necking development respectively. From the incremental analysis, both relations between the total elongation δ and m as well as n are given as: $\delta = (1/\alpha(0))^{m-1}$; $\delta = (1/\alpha(0))^{m+n-1}$. The result of the integral analysis is the same as the integral expressions (when $n=0$) derived by Hutchinson et al. Comparing these theoretical results with experimental results, the coincidence is good. In addition, a load analysis is made and two load expressions are given. (11 refs.)
- 76549 Cross-slip in the high-temperature deformation of germanium, silicon and indium antimonide. H.Siethoff (Phys. Inst., Univ. Wurzburg, Wurzburg, Germany). *Philos. Mag. A (GB)*, vol.47, no.5, p.657-69 (May 1983). In most materials, steady-state creep at high temperatures is governed by diffusion-controlled recovery processes. Exceptions to this rule are silicon and germanium, where the measured activation energies are distinctly higher than those of self-diffusion, an effect which has not been understood until now. It is shown that a cross-slip mechanism is most probably working in the steady-state regime of these semiconductor elements, and that Escaig's model (1968) can describe fairly well the published data. In the light of these results, the recently discovered second recovery stage (stage V) in the stress-strain curves of germanium, silicon and indium antimonide may be caused by cross-slip rather than by a diffusion-controlled recovery process, as proposed earlier. (38 refs.)
- 76550 Identification of slip systems in cubic boron nitride. C.A.Brookes, R.M.Hooper, W.A.Lambert (Dept. of Engng. Sci., Univ. of Exeter, Exeter, England). *Philos. Mag. A (GB)*, vol.47, no.5, p.19-12 (May 1983). Knoop indentation hardness measurements have been made at room temperature, on (001) and (111) surfaces of cubic boron nitride crystals. Subsequent

heat treatment of the crystals, in air at temperatures of 900°C and above, caused a rapid expansion of the dislocated volume beneath the indentation and the formation of etched slip traces. Observations on the nature of anisotropy in hardness and the geometry of the slip traces have been used to identify {111}{110} as the active slip system in cubic boron nitride. (11 refs.)

76551 Localized shear deformation of amorphous metals. J.C.M.Li (Dept. of Mech. Engng., Univ. of Rochester, Rochester, NY, USA). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.267-76

The characteristics of localized deformation in amorphous metals are reviewed. All the available evidence seems to suggest that dislocations are responsible for shear localization. These dislocations seem to require a stress concentration for their nucleation. Once nucleated, they are capable of producing both forward and reverse shear in a narrow band, much like the dislocations in crystalline materials. (27 refs.)

76552 Dependence of the rate of intrareactor creep on the stress. Yu.S.Patiletyov, O.G.Tyupkina (Inst. of Nuclear Phys., Acad. of Sci., Alma-Ata, Kazakh SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.792-7 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The mechanism of radiation creep, based on the combined motion of dislocations including glide and climb, is used to calculate the rate of deformation $\dot{\epsilon}_{rad}$ on the stress σ . It is shown that at low stresses the rate of rise of $\dot{\epsilon}_{rad}$ on increase in σ follows a nearly linear law, whereas at high values of σ there is a considerable deviation from linearity. These theoretical predictions are in agreement with the experimentally observed nonlinear dependence of the rate of intrareactor creep on the applied stress. (22 refs.) A.T.

62.20M Fatigue, brittleness, fracture, and cracks
(inc. hardness; see also 81.40N Fatigue, embrittlement and fracture)

76553 Microhardness of glassy chalcogenides in the (As₂Se₃)_x(Bi₂Se₃)_{1-x} system. A.O.Matkov's'kii, O.I.Shpotyuk, I.V.Savits'kii, V.A.Kayushkii, L.V.Kraev's'ka. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.1, p.83-6 (1983). In Ukrainian.

It is established that reduction of Bi₂Se₃ content in the (As₂Se₃)_x(Bi₂Se₃)_{1-x} (0.88 $\leq x \leq 1.00$) system increases microhardness values of glass. The character of chemical bonds varies essentially under γ -irradiation. However, heat treatment at 80 and 120°C does not restore the initial values of microhardness. (6 refs.)

76554 A theoretical study of acoustic emission from a crack extension event. I.M.Boswarva (Joint Inst. for Advancement of Flight Sci., George Washington Univ., Hampton, VA, USA). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.379-88 (1983).

The acoustic emission signals resulting from a small extension of an existing crack in a body under tensile stress are calculated using a particular model of

the crack extension event. The dependence of the signal on the duration of the event is evaluated; and it is shown that the signal strength depends markedly on the position and characteristics of the transducer and on the crack orientation. Simultaneous measurements with an array of transducers on the surface of the specimen could therefore provide additional information about the nature of the crack extension event. (11 refs.)

76555 Theory of fatigue for brittle flaws originating from residual stress concentrations. E.R.Fuller, B.R.Lawn (Fracture & Deformation Div., NBS, Washington, DC, USA), R.F.Cook. *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.314-21 (May 1983).

A theory is formulated for the general fatigue response of brittle flaws which experience residual stress concentrations. The indentation crack is taken as a model flaw system for the purpose of setting up the basic fracture mechanics equations, but the essential results are expected to have a wider range of applicability in the strength characterization of ceramics. A starting fatigue differential equation is first set up by combining an appropriate stress intensity factor for point- or line-contact flaws with a power-law crack velocity function. Analytical solutions are then obtained for the case of static fatigue. The resulting relation between lifetime and failure stress is shown to have exactly the same power-law form as the conventional solution for Griffith (residual-stress-free) flaws. This 'equivalence' is used as a basis for extending the results to dynamic fatigue. A comparison of these analytical solutions with numerical counterparts defines the limits of accuracy of the theoretical procedure. However, while the form of the life-time relation remains invariant, the values of the exponent and coefficient differ significantly for flaws with and without residual stress. (20 refs.)

76556 Microhardness of β -alumina single crystals. J.Thery, A.M.Lejus (Lab. de Chimie Appliquée de l'Etat Solide, ENSCP, Paris, France).

Mater. Res. Bull. (USA), vol.18, no.4, p.481-90 (April 1983). In French. Knoop microhardness is investigated as a function of indenter orientation on the $\{1120\}$ and $\{0001\}$ planes of β_{M+} alumina single crystals ($M^+ = Na^+$, Ag^+ , K^+ , Tl^+ , NH_4^+). For the prismatic planes, maximum hardness values are always obtained along the $[0001]$ direction. For the basal plane the direction corresponding to the maximum hardness depends upon the nature of the M^+ ion. For β_{Na} alumina the maximum hardness value is found along the $\{1120\}$ directions; in this case microhardness anisotropy analysis suggests that the active slip systems are $\{0001\}$ $\{1120\}$. For β_{Ag} , β_K , β_{Tl} the maximum hardness value is along the $\{1010\}$ directions. This difference of mechanical behaviour might be in relation with the structural differences in these β -aluminas (variations in the local structure of the conduction planes). The temperature dependence of the microhardness for β_{Na} and β_{Ag} single crystals is reported between 20° and $700^\circ C$. (27 refs.)

76557 A quantitative approach to the cell shuttling model. D.J.Quesnel, J.C.Tsou (Mech. Engng. Dept., Univ. of Rochester, Rochester, NY, USA).

Mater. Sci. & Eng. (Switzerland), vol.59, no.1, p.91-8 (May 1983). A quantitative treatment of the cell shuttling model for strain accommodation in cellular microstructures during low cycle fatigue is developed. Based on the fraction of dislocation interactions with repulsive character, the functional form for the distribution of mesh lengths available for reversed deformations is determined explicitly and is used to evaluate the contribution of the cell shuttling model to the hysteretic stress-strain behavior. It is shown analytically that the cell shuttling model leads to a linear relationship between cell size and critical mesh length when the dislocation configuration and hence the stress-strain behavior is required to be reproduced on each consecutive cycle. (15 refs.)

76558 On the contrast between mode I and mode III fatigue crack propagation under variable-amplitude loading conditions. H.Nayeb-Hashemi (Dept. of Mech. Engng., Northeastern Univ., Boston, MA, USA), S.Suresh, R.O.Ritchie.

Mater. Sci. & Eng. (Switzerland), vol.59, no.1, p.L1-5 (May 1983). From the perspective of defect-tolerant life prediction procedures, the mode III fatigue crack subjected to variable-amplitude loading presents a less complex problem than the mode I crack. In the absence of loading sequence interaction effects, crack growth rates and hence fatigue lifetimes should be predictable from mere constant-amplitude data simply by summing the damage (in the form of Coffin-Manson damage or in terms of the relevant crack tip characterizing parameter, i.e. ΔK , the crack tip displacement ΔCTD etc.) for each load reversal in the loading history. Preliminary attempts at such simple modelling approaches for mode III cracks subjected to single overload cycling and arbitrary loading histories in fact appear promising for the prediction of variable-amplitude crack growth behavior. (16 refs.)

76559 Thermal-activation interpretation of splitting fracture. A.M.Molodets, A.N.Dremin (Inst. of Chem. Phys., Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.652-4 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1385-9 (Aug. 1982). [received: May 1983]

When solids are loaded under quasistatic conditions the main part of the durability is accounted for by the duration τ of the stage of accumulation of fracture nuclei. In this case τ and the applied stress σ are related in a manner characteristic of thermally activated processes: $\tau = \tau_0 \exp((U_0 - \gamma\sigma)/RT)$, where R is the gas constant, T is the absolute temperature, τ_0 is a universal coefficient for solids (equal to 10^{-13} sec), U_0 is the activation energy, which is determined by interatomic interaction and is a constant of the material, and γ is a coefficient which is determined by the superatomic structure and reflects the role of local stresses in the process of formation of incipient discontinuities. The authors give a functional relation between the local stresses and average stresses which enables the dependence of the splitting-fracture strength on the time of the subcritical stage to be described on the basis of this equation. (8 refs.)

76560 Influence of the concentration of chemical sites on the strength of solid polymers. N.N.Peschanskaya, V.A.Stepanov, E.M.Filyanov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1851-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3272-7 (Nov. 1982). [received: May 1983]

An investigation was made of the resistance to deformation and the kinetic parameters of creep of epoxy resins with different degrees of cross-linking. A full analysis was found between the deformation and relaxation properties of cross-linked and linear polymers below the glass-transition temperature. (15 refs.)

76561 Mechanism of fatigue crack propagation in metallic materials. M.N.Georgiev, V.Yu.Dogadushkin, N.Ya.Mezhova, V.N.Minaev, L.P.Strok (All-Union Sci.-Res. Inst. for Railroad Transportation, Moscow, USSR).

Sov. Mater. Sci. (USA), vol.18, no.4, p.319-25 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.35-42 (July-Aug. 1982). [received: May 1983]

On the basis of dislocation concepts and linear fracture mechanics and taking into consideration the results of X-ray and electron fractography an attempt is made to explain the mechanism of fatigue crack growth. (23 refs.)

62.40 ANELASTICITY, INTERNAL FRICTION, AND DAMPING

(see also 81.40J Elasticity and anelasticity)

76562 Anelastic relaxation phenomena in plasma-sprayed (Al₂O₃)₃MgO spinel with reference to diffusion process. M.Halbachs (Ecole Nat. Supérieure de Ceramique Industrielle, Limoges, France), P.Mazot, J.Woirgard. *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.157-64 (16 March 1983). Internal friction experiments are performed on a plasma-sprayed (Al₂O₃)₃MgO non-stoichiometric spinel. Isothermal damping spectra are obtained between 650 and 850°C. They revealed a high isolated peak for forced torsional vibration frequencies ranging between 10⁻⁵ and 30 Hz. The temperature dependence of the relaxation rate follows a Boltzmann law over more than four decades: $\tau^{-1}(s^{-1}) = 10^{19}(s^{-1}) \exp(-3.96(eV)/kT)$. The corresponding activation energy appears to be in rather good agreement with cationic diffusion data for the same material. A point defect migration mechanism is inferred for the observed damping and the relaxation rate is assigned to the mean cationic jump frequency. The present results show that

internal friction is a promising approach for the kinetic and structural study of ionic mobility in oxide compounds. (20 refs.)

76563 Internal friction in cold-worked nickel-carbon. B.Purniah, R.Ranganathan (Materials Sci. Lab., Reactor Res. Centre, Tamil Nadu, India). *Philos. Mag. A (GB)*, vol.47, no.5, p.L23-7 (May 1983). An experimental investigation of relaxation in the cold-worked Ni-C system reveals an internal friction maximum at ~430°C at a frequency of ~1 Hz. The peak is thought to be due to the dislocation-carbon interaction analogues to the cold-work peak in b.c.c. metals. This peak found in f.c.c. metals seems to illustrate the Seeger model (1979) for the 'Snoek-Koster' relaxation or the cold-work peak. (7 refs.)

76564 Ultrasonic study of molecular interaction in carbon tetrachloride-toluidine mixtures. V.A.Tabhane, B.A.Patki (Dept. of Phys., Inst. of Sci., Nagpur, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.3, p.155-8 (March 1983). The velocity of ultrasonic waves (2 MHz) for different compositions of mixtures of CCl₄+o-toluidine and CCl₄+p-toluidine has been measured in the temperature range 10-50°C and 30-55°C respectively. The velocity (c) versus composition (C_m) plots exhibit peak at X_A:X_B=8:2 in CCl₄+p-toluidine. The excess compressibility β_a^E , excess van der Waals' parameter b^E and (dc/dT)^E have been discussed in the light of intermolecular AB interaction and resulting disorder in these mixtures. The strength of AB interaction depends not only upon the nature of the groups but also on their relative positions in the ring. (26 refs.)

76565 Ultrasonic study of two-component systems. P.Pande, B.P.Pandey (Dept. of Petroleum Engng., Indian School of Mines, Dhanbad, India). *Indian J. Phys. Part B*, vol.56B, no.6, p.325-33 (Dec. 1982). [received: May 1983]

Adiabatic compressibility (β), molar volume (V), intermolecular free length (L_f), available volume (V_a), free volume (V_f), and Raos number (R) has been calculated from ultrasonic velocity and density measurements in two binary systems, viz., carbon tetrachloride+benzene and carbon tetrachloride+acetone at 25°C. Non-linear behaviour in these properties show presence of molecular interaction, which is weak in the first system while strong in the second one. Rao's (1940, 1941) equation has been discussed in light of recent studies. (38 refs.)

76566 Temperature dependence of the velocity of ultrasound and electrical conductivity of an epoxy composite with a carbon filler. I.N.Ermolenko, V.I.Krylovich, V.I.Alekseenko, V.I.Dubkova, P.N.Logvinovich, I.P.Lyubliner (Inst. of Appl. Phys., Acad. of Sci., Minsk, Belorussian SSR). *J. Eng. Phys. (USA)*, vol.43, no.3, p.992-5 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.413-17 (Sept. 1982). Experimental data are given on the behavior of the velocity of ultrasound and electrical conductivity as a function of the temperature in an epoxy composite material filled with carbon fiber. (12 refs.)

76567 Acoustic emission initiated by ion implantation in bubble garnet films. D.Adiene, L.Pranevicius, G.Zubauskas (Phys. Dept., Kaunas Polytech. Inst., Kaunas, USSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K35-7 (16 March 1983). The authors present the results of the acoustic emission (AE) from bubble garnet films during implantation for H⁺ and Ne⁺ at 100 keV energy. These results are compared with static bubble parameters in Ne⁺ implanted films. AE detection was carried out by the means of a bulk LiNbO₃ crystal of 1.2

MHz resonance frequency. Acoustic contact with the garnet film was provided. Garnet films with composition $(\text{YSmCa})_2(\text{FeGe})_5\text{O}_{12}$ grown by LPE on (111) GGG substrates were investigated. (4 refs.)

76568 An acoustic emission source model for both continuous and burst-type emission analysis. I. Theory. D.Rouby, P.Fleischmann, C.Duvergier (Inst. Nat. des Sci. Appl. de Lyon, Villeurbanne, France). *Philos. Mag. A (GB)*, vol.47, no.5, p.671-87 (May 1983).

An acoustic emission model is presented. The source is described by a dislocation which moves between two steady positions. By using dynamic Green functions, expressions for the displacement waves emitted by the creation of a small dislocation loop are given, as a function of the orientation between the Burgers vector, propagation path and the loop area. The elastic wave emitted by a source event is obtained, in time and frequency domains, by considering the dislocation movement over the whole source area. For frequencies higher than 2 MHz, the displacement, which is pulse shaped, bears a close relation with source area and dislocation velocity; this accounts for burst-type acoustic emission analysis in a quantitative way. The signal produced by very numerous and randomly activated sources is analysed; this analysis permits the interpretation of continuous emission. (17 refs.)

76569 An acoustic emission source model for both continuous and burst-type emission analysis. II. Experiments. D.Rouby, P.Fleischmann, C.Duvergier (Inst. Nat. des Sci. Appl. de Lyon, Villeurbanne, France). *Philos. Mag. A (GB)*, vol.47, no.5, p.689-705 (May 1983).

For pt.I see *ibid.*, vol.47, no.5, p.671 (1983). In part I, an acoustic emission source model has been proposed. In the second part, the source model is used to interpret both continuous emission and burst-type emission. The acoustic emission is recorded by using broad-band piezoelectric transducers which are described. In the case of continuous emission, linked to homogeneous plastic deformation, spectral analysis gives access to the dislocation mean flight time. For Al-Mg solid solutions, evidence is found for thermally activated obstacle passing: the flight time decreases if the test temperature increases and if the Mg content decreases. In the case of burst-type emission, observed during tensile testing of 2024 T351 aluminium alloy, examples of recorded signals are given. The signal contains numerous echoes which are analysed: these echoes result from reflections and mode conversions inside the specimen and permit source localization. The direct recording of the displacement wave predicted by the source model using a 'thick' piezoelectric transducer is described. The shape of the displacement impulse leads to the source event time and to the source size. (14 refs.)

76570 Ultrasonic studies of N-formylmorpholine+water mixtures. A.M.Awad, A.M.North, R.A.Petrick (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.3, p.449-61 (March 1983).

N-formylmorpholine (NFM)+water mixtures are used to extract aromatics from petroleum feedstocks. Possible conformational and structural causes of this specific solvation are investigated using ultrasonic attenuation and velocity measurement complemented by ^{13}C NMR, density and viscosity observations. The conformational studies suggest that gross rearrangements of the morpholine ring are relatively slow (below 60 MHz) but that inversion at the nitrogen atom is faster, with lower activation energy, than in other morpholine analogues. Structural information is inferred mainly from excess volumes and adiabatic compressibilities of mixing. The observations suggest that when NFM is added to water it first introduces hydrogen bonding and ordering of water molecules not bound into an extended ice I tetrahedral structure; then at higher concentrations it disrupts this structure to a less open, but no less compressible, hydrogen-bonded array of 'quasi-planar' NFM capable of absorbing aromatic rings. 63.10 GENERAL THEORY

76571 Generator coordinate treatment of some model periodic systems. L.R.Kauder, A.K.Ray, S.B.Trickey (Dept. of Phys., Univ. of Florida, Gainesville, FL, USA). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1355-61 (April 1983).

The generator coordinate method (GCM) is a powerful variational technique invented for studying nuclear collective motion and extended in recent times by Lathouwers, Van Leuven, and Laskowski et al. to problems of molecular electronic structure and vibrations. In preparation for the application of GCM to electron correlation, and lattice dynamical problems in solids, the authors have studied linear periodically bounded systems consisting of one- and two-mass anharmonic chains of both finite and infinite length. Preliminary results for the variational energy and vibrational spectra from some simple intrinsic functions are presented. (7 refs.)

76572 A quantum field theory of crystals. IV. T.Kitamura (Dept. of Phys., Univ. of Alberta, Edmonton, Alberta, Canada). *Physica A (Netherlands)*, vol.119A, no.1-2, p.67-77 (April 1983).

For pt.III see *ibid.*, vol.110A, p.282 (1982). One-dimensional boson and fermion systems are investigated for which the ground state expectation value of a molecule field does not exist; the assumptions on the energy bands and the two-body potential are the same for both systems. The systems behave essentially in the same fashion; they have particle-hole pairs, gapless phonons, energy dispersions with a linear momentum etc. It is shown that the coefficient of the momentum in the boson energy spectrum is larger than that in the fermion one. (5 refs.)

76573 Lattice dynamics of isotopic alloys with applications to ^{67}Zn Mossbauer spectroscopy. W.T.Vetterling, D.Candela (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5394-403 (1 May 1983).

The 'recursion method' is applied to the dynamics of disordered lattices, and is used explicitly to calculate properties of isotopically disordered zinc. The specific heat and atomic motion are calculated for the special case of an isotopically pure lattice and compared to previous experimental and theoretical results. Then Mossbauer-effect calculations for the high-resolution ^{67}Zn isotope are presented, including evaluations of the Mossbauer line shift with temperature, the anisotropic recoil-free fraction, and the Goldanskii-Karyagin effect. In addition, the effect of zero-point motion on the Mossbauer line position and linewidth in isotopically disordered zinc is discussed. (61 refs.)

76574 Vibrational properties of silver iodide at high frequencies. A.P.Kovalenko. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.696-704 (May 1983). In Russian.

Vibrational properties of AgI at high frequencies are considered by means of a model admitting an existence of slightly centre-displaced tetrahedral positions of Ag^+ in the wurtzite structure. Such displaced positions lead directly to an appearance of two 'impurity' bands in the vibrational crystal spectrum according to experimental results. (12 refs.)

- 76575 Influence of electron relaxation on the damping of long-wavelength optical phonons in metals heavily doped semiconductors. I.P.Ipatova, A.V.Subashiev, V.A.Shchukin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1932-6 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3401-9 (Nov. 1982). [received: May 1983]

It is shown that the electronic contribution to the damping of optical phonons with small wave numbers, when the interaction of the phonons with free electrons (the Landau mechanism) is ineffective, is due to the finite lifetime of the electrons. As this decreases, the phonon damping variation is not monotonic, which may cause the Raman lines to become narrower with increasing temperature and impurity concentration. There is experimental evidence of such behavior. In many-valley semiconductors, there is a contribution to the phonon damping from unscreened diffusion of electrons in particular valleys, as well as from the relaxation mechanism. The diffusion mechanism also gives a strong dispersion of the optical branch at small wave numbers. The applicability of a single linearized transport equation in the limits of both fast and slow relaxation is elucidated. (19 refs.)

- 76576 Dynamical behaviour of interstitials in elemental semiconductors. D.N.Talwar (Dept. of Marine Sci., Texas A&M Univ., Galveston, TX, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2366-71 (May 1983).

The dynamical behaviour of isolated interstitials in elemental semiconductors has been described using the well-known Green's function theory. Assuming the defect to be at the tetrahedral site, the author has exploited the symmetry properties of the point group $\{T_d\}$ so as to make the problem amenable to calculations. The conditions for the occurrence of impurity modes and IR absorption have been derived in terms of the mass of interstitial and the impurity-host interactions. All the involved lattice Green's functions are calculated by incorporating the phonons obtained from a simplified second-neighbour force model fitted to neutron scattering experiments on silicon. Numerical calculations are made for the localised vibrational modes and the impurity-induced IR absorption for different interstitials in Si. The calculated results are compared with existing theoretical and experimental data. (33 refs.)

- 76577 Solitary waves in one-dimensional hydrogen-bonded systems. S.Yomosa (Dept. of Phys., Nagoya Univ., Nagoya, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1866-73 (May 1983).

The author has studied again the dynamical properties of protons in one-dimensional H-bonded system, taking account of the coupling between the proton motion and the lattice deformation. It is found that the solitary waves of the proton-polarization are accompanied by the local lattice-deformations. Kink and antikink solutions correspond to ionic D_i default (H_2O^+ ion) and I_i default (OH^- ion), respectively. Two modes of solitary waves and two modes of phonons are found in the four respective regions of wave velocities.

- 76580 Construction of a wide-range tabular equation of state for copper. K.S.Trainor (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2372-9 (May 1983).

A global equation of state (EOS) for copper has been constructed, ranging from densities of 10^{-3} - 10^3 Mg/m^3 and from ambient temperatures to $5 \times 10^4 \text{ eV}$ ($1 \text{ eV} = 11604.5 \text{ K}$). Six different theoretical models were used: a soft sphere liquid model at low temperatures below melt density; an ionisation equilibrium model based on a modified Saha method at moderate temperatures in expansion; a nonideal plasma theory for high temperatures; a modified Thomas-Fermi-Kirzhnits model in compression; rigorous electron band theory for the zero degree isotherm; and a semiempirical model in the solid-liquid-vapour region. Assembly of the EOS will be described. Agreement with existing experimental data is good. (32 refs.)

- 76581 Equation of state of sodium at pressures up to 30 GPa. I.V.Aleksandrov, V.N.Kachinskii, I.N.Makarenko, S.M.Stishov (Inst. of Crystallography, Acad. of Sci., USSR).

JETP Lett. (USA), vol.36, no.9, p.411-15 (5 Nov. 1982). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.336-9 (5 Nov. 1982). [received: June 1983]

The equation of state of sodium has been studied by an X-ray method at pressures up to 30 GPa at 303K for the first time, through the use of a diamond-anvil technique. The possibility of using this equation of state to construct a high-pressure scale is discussed. (14 refs.)

76582 Substrate-strain effects on the Frenkel-Kontorova system. T. Munakata (Dept. of Appl. Math. & Phys., Kyoto Univ., Kyoto, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1635-40 (May 1983). Substrate-strain effects on the Frenkel-Kontorova system are investigated under the continuum approximation. The long-wavelength component of the strain field is shown to give rise to an extra biharmonic potential, modifying the basic equation from the sine-Gordon to the double sine-Gordon equation. A kink propagates accompanied by a local strain field, thus behaving like a kind of polaron. Implications for the commensurate-incommensurate transition studied by Frank and van der Merwe and others are also given.

76583 Complete devil's staircase, fractal dimension, and universality of mode-locking structure in the circle map. M.H. Jensen, P. Bak, T. Bohr (H.C. Ørsted Inst., Copenhagen, Denmark). *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1637-9 (23 May 1983). It is shown numerically that the stability intervals for limit cycles of the circle map form a complete devil's staircase at the onset of chaos. The complementary set to the stability intervals is a Cantor set of fractal dimension $D=0.87$. This exponent is found to be universal for a large class of functions. (10 refs.)

76584 Ordering in orthorhombic crystals. A. Ya. Mitus', A.Z. Patashinskii. *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1900-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3344-52 (Nov. 1982). [received: May 1983]

An effective Hamiltonian describing spatial ordering and a local crystal order parameter of orthorhombic symmetry (a tensor of rank four) are proposed. Simple models are used to study a sequence of phase transitions involving a change in the symmetry in a crystal. The absence of biaxial nematic liquid crystals is discussed. The behaviour of thermodynamic and elastic properties of crystals in the neighborhood of their phase transitions is investigated. The region of existence of a metastable low-temperature phase in first-order phase transitions is found to be small: $\tau \leq 0.01$. The proposed theory predicts premelting anomalies in crystals. 76585 Solid+liquid equilibrium diagram of acetanilide+phenacetine mixtures determined by differential scanning calorimetry. M. Antonietti Macip (Dept. of Materials Engng., Drexel Univ., Philadelphia, PA, USA), M. Antonia Valerdi.

Mater. Chem. & Phys. (Switzerland), vol.8, no.3, p.259-64 (March 1983). Experiments for the title system are described and results reported in tabular form. The system forms solid solutions with a minimum. Location of the acrostallotropic point has been determined. (5 refs.)

76586 Thermodynamics on UO_2 - ZrO_2 - LnO_2 -x solid solutions. F. Schleifer, A. Naoumidis, H. Nickel (Inst. fur Reaktorwerkstoffe, KFA Julich GmbH, Julich, Germany).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.143-58 (April 1983).

The stability and the equilibrium oxygen partial pressure of solid solutions between UO_2 , ZrO_2 and the oxides of the lanthanides (LnO_{2-x}) were studied. The oxygen potential of the mixed oxides was determined by the EMF-method. Both solid Fe+FeO and dry air electrodes were used as reference. The results indicate that the uranium substitution by zirconium and the lanthanides in the U-Zr-Ln mixed oxides stabilizes the higher 'uranium valencies' by increasing the oxygen solubility in these solid solutions under a given oxygen partial pressure. The strength of this stabilization increases in the order of Zr, Nd, Ce, La substitutions. The difference in the stabilization of mean uranium vacancies can also be interpreted in terms of the difference in the lattice parameter of the solid solutions. (43 refs.)

76587 Hard discs with embedded three dimensional quadrupoles. P.N. Kusalik, S.F.O'Shea (Dept. of Chem., Univ. of Lethbridge, Lethbridge, Alberta, Canada).

Mol. Phys. (GB), vol.49, no.1, p.33-52 (May 1983).

A survey of the structural and thermodynamic behaviour of hard discs with embedded three dimensional quadrupoles of linear symmetry has been made using Monte Carlo methods. The results for dilute samples at high temperatures (small quadrupole moments) are consistent with thermodynamic perturbation theory. Those for higher density or lower temperatures (larger quadrupole moments) indicate the existence of two solid phases, one a high density hexagonal solid and the other a lower density square structure. No convincing evidence was found for the existence of a distinct liquid phase, but the data are not sufficiently detailed to provide a reliable determination of the phase diagram. Structural evidence has been found for the coexistence of the two solids, and the interface between the two structures seems to lead to relatively little disruption in either phase, at least for small 'domain' sizes. The stability of the square structure is easily understood in terms of the large quadrupole energy it achieves, in spite of being about 15 per cent less dense

than the hexagonal solid, which has approximately the same energy. (32 refs.)

76588 Spontaneous radiative coupling of atomic energy levels. D.A. Cardimona, C.R. Stroud, Jr. (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA).

Phys. Rev. A (USA), vol.27, no.5, p.2456-61 (May 1983). Density-matrix equations of motion derived from Heisenberg picture source-field quantum electrodynamics contain damping constants and frequency shifts which are not associated with a single radiative transition but which instead couple two separate transitions together. In the absence of degeneracies in the atomic levels, these coupling terms are normally neglected when the rotating-wave approximation is invoked. These terms cannot be neglected when there are degeneracies or near degeneracies. In this paper the authors interpret the generalized frequency shifts, show how they can be renormalized, and included in shifts of atomic energy levels and altered damping constants and discuss their experimental significance. (12 refs.)

76589 Phase diagram of ZrV_2 . A.S. Balankin (Engng. Phys. Inst., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1777-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3475-7 (Nov. 1982). [received: May 1983]

A complete phase diagram of ZrV_2 corresponding to the thermodynamic potential is a set of intersecting hypersurfaces in a nine-dimensional space of the coefficients a_i , d_i , and α_i ($i=1,2$) and b_i , C_i , and A_i . The main features of the phase transitions in ZrV_2 can be described by considering a phase diagram using the coordinates $\alpha_2/d_1 = 1/2 C_{44}$. (9 refs.)

(see also 81.30F Solidification)

76590 Study of the solid-liquid equilibria of pseudo-binary systems $MPbO_3$ - $Ce(PO_3)_3$ ($M=Rb, Cs$). M. Rzaigui, N. Kbir Arigui (Lab. de Phys.-Chimie Minérale, Ecole Normale Supérieure, Tunis, Tunisia).

Mater. Chem. & Phys. (Switzerland), vol.8, no.4, p.365-78 (April 1983). In French.

The establishment of solid-liquid phase equilibrium diagrams of the system $MPbO_3$ - $Ce(PO_3)_3$ with $M=Rb$ and Cs , provides evidence of condensed phosphates of different compositions: $M_2Ce(PO_3)_4$ and $M_2Ce(PO_3)_5$. The chemical preparation and the main crystallographic features established by X-ray diffraction and IR spectroscopy are discussed. (13 refs.)

76591 Theoretical derivation of Lindemann constant for Mie's potential using Sharan and Prakash's criterion for melting. S. Prakash (Dept. of Phys., Inst. of Technol., New Delhi, India).

Indian J. Pure & Appl. Phys., vol.21, no.3, p.148-50 (March 1983).

Sharan and Prakash (1967) from their study on alkali halides using Born and Born Mayer's potentials concluded that the ratio of the interatomic separation at the point of inflection to that at absolute zero is approximately constant. The same has been used for getting the ratio U_0/kT_m (where U_0 is the interaction energy per particle at absolute zero of temperature and T_m the melting temperature) and also the Sutherland-Lindemann empirical melting point equations from Mie's potential. It has been concluded that the Sutherland-Lindemann constant is structure dependent. The agreement between the theory and experiment for U_0/kT_m is good for alkali halides. The theory has been extended to include the order-disorder effect in binary systems. (4 refs.)

76592 Oscillatory morphological instabilities due to non-equilibrium segregation. S.R. Coriell (NBS, Washington, DC, USA), R.F. Sekerka.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.499-508 (April-May 1983).

Linear perturbation theory is used to study morphological instability for rapid directional solidification at constant velocity under conditions where there is significant departure from local equilibrium at an initially planar solid-liquid interface. Under conditions where the segregation coefficient k depends significantly on velocity v , the stability criterion depends explicitly on both k and $\partial k/\partial v$ and instabilities that are oscillatory in time can occur for solute concentrations that are much smaller than those that would be necessary to cause non-oscillatory instability for the same k if $\partial k/\partial v$ were simply neglected. Such oscillatory instabilities seem to be related to a 'solute pump' mechanism according to which local changes in k , due to periodic changes in local interface velocity v , can occur out of phase with local interface position, thus resulting in lateral inhomogeneity of concentration on a length scale large enough that the resulting instabilities will not be suppressed by capillarity. Such instabilities can, however, be suppressed by a sufficiently large dependence of interface undercooling on v . (11 refs.)

76593 Preferred crystallographic orientation for crystallisation under non-hydrostatic stress. M.E. Fleet (Dept. of Geology, Univ. of Western Ontario, London, Ontario, Canada).

Phys. Status Solidi A (Germany), vol.76, no.1, p.151-6 (16 March 1983).

The equation of Gibbs for the chemical potential of a nonhydrostatically-stressed solid in an adjacent fluid is revised to $\mu = A + pV - \sigma'_{ij} \epsilon'_{ij} V_0$ (where, V_0 is the molar volume at a reference state of zero stress, σ'_{ij} is the deviatoric stress tensor, ϵ'_{ij} is the deviatoric strain tensor, and p is the pressure of the hydrostatic component of the nonhydrostatic stress field). μ is equated with the Gibbs free energy of the pure phase and is independent of the fluid pressure. Preferred crystallographic orientation of a crystalline phase deformed through crystallisation under nonhydrostatic stress is indicated by minimisation of $-1/2\sigma'_{ij}\epsilon'_{ij}$ (where, σ'_{ij} is the stress tensor, and ϵ'_{ij} is the strain tensor). (13 refs.)

76594 Pressure effect on the melting point of alkali metals. T.Soma, H.Matsuo Kagaya, J.Sato (Dept. of Appl. Phys. & Math., Mining Coll., Akita Univ., Akita, Japan).

Solid State Commun. (USA), vol.46, no.8, p.661-3 (May 1983).

The mean-square displacement of alkali metals is studied theoretically using the authors local Heine-Abarenkov-type model potential in the perturbational scheme. The temperature-dependent mean-square displacement of alkali metals decreases as a function of the compressed volume. Lindemann's criterion for melting x_m , which is defined as the ratio of two times the root-mean-square displacement to the nearest-neighbour distance, is found to be nearly constant for five alkali metals. The volume effect on the melting temperature of alkali metals is studied by keeping x_m constant. The obtained melting curve increases as function of the compressed volume and are qualitatively in good agreement with the observed tendency for alkali metals. (12 refs.)

76595 On the solvability of the two-phase quasistationary crystallization problem. E.V.Radkevich, A.S.Melikulov.

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.540-2 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.58-62 (July 1982). [received: April 1983]

Using the boundary-variation method, the authors prove that the two-phase elliptical boundary-value problem with a free boundary and adjoining fixed boundary is solvable in the class of Lipschitz free boundaries. (3 refs.)

76596 Oriented crystallization of metals in the presence of electric current. V.F.Gordeev, A.V.Pustogarov, Ya.R.Kuchero, V.A.Sukhinin. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.465-7 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1079-81 (Sept. 1982). [received: May 1983]

The authors report a study of the effect of current flow on the crystallization of metals. The metal was melted at the electrodes of an arc and by the heating of conductors through which a high current was passed. In both cases, the crystallization of the metals occurred after the current flow was stopped. The surface temperature of the liquid metal was measured with a fast PFM-315 micropyrometer. The structure of the materials was studied by the LAU method with URS-60 and DRON-1 X-ray diffraction cameras. (6 refs.)

76597 Kinetic study on glass formation and crystallization behavior in a continuously cooling melt. R.Ota, T.Kato, N.Soga (Dept. of Industrial Chem., Kyoto Univ., Kyoto-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.2, p.73-81 (1983). In Japanese.

An equation has been derived which gives the fraction $X(t)$ of a crystallized phase in a continuously cooling melt assuming homogeneous nucleation and isotropic crystal growth. From this equation a tentative and simple expression for $X(t)$ has been constructed in terms of liquid parameters which enables the essential roles of liquid parameters involved in the glass formation of a supercooled liquid to be understood. Assuming a minimal constant value for $X(t)$ the critical cooling rate Q^* of a given melt can be estimated from the liquid parameters by, $\log Q^* = -\log \eta_L - 0.06 E_a/T_L - 3 T_0/T_L + 2 \log T_L - \log V - 38 \alpha^2 \Delta S_f - 0.25 \log X(t) + 5 \pm 0.5$ where Q^* is critical cooling rate (K/s), η_L is the liquid viscosity (poise), E_a is the activation energy for viscous flow (cal/mol) at the liquidus temperature T_L (K), T_0 is a constant in the Fulcher type viscosity (K), V is the molar volume (cm³/mol), ΔS_f is the fusion entropy per flow unit (cal/K.mol) and α is the dimensionless surface tension in the range 0.3-0.5. Although the equation has been derived for one-component liquid, it may be valid also for multi-component liquid in a semi-quantitative way as has been tested in the B₂O₃-Na₂O system. (27 refs.)

76598 Development of morphological instability and cells during rapid solidification of laser annealed silicon alloys. J.Narayan, C.W.White (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.553-8

The details of morphological instability occurring during rapid solidification have been studied in In⁺, Ga⁺, Sb⁺, Bi⁺, Ge⁺, Fe⁺ and Cr⁺ implanted silicon specimens after pulsed laser annealing. The average cell sizes were determined at the onset of instability and in the region of well-developed instability using electron microscopy. The total and substitutional solute concentration profiles were determined using Rutherford backscattering and channeling techniques. The formation of cells and the critical solute concentrations associated with instability were studied as a function of velocity of solidification. The results were compared with the predictions of the perturbation theory which took into account the dependence of distribution coefficients on the velocity of solidification. A good agreement between the calculations and the experimental results was obtained. The authors also examined theoretically the effect of reduction in surface tension due to segregation of impurities on cell sizes and critical solute concentrations associated with instability. 64.70F Liquid-vapour transitions

76599 Phase equilibria in the H₂/C₂H₄ system at temperatures from 114.1 to 247.1K and pressures to 600 MPa. A.Heintz, W.B.Streett (School of Chem. Engng., Cornell Univ., Ithaca, NY, USA).

Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.4, p.298-303 (April 1983). Experimental data for liquid-vapor phase compositions of hydrogen+ethylene are reported for 14 temperatures in the range 114.1 to 247.1K and pressures up to 600 MPa. The data have been obtained using a vapor-recirculating apparatus suitable for measurement up to 1000 MPa. The entire region of liquid-vapor coexistence has been explored. The mixture critical line and the pressure temperature trace of the 3-phase line solid-liquid-vapor have been located. These lines intersect at 153K and 675 MPa to form an upper critical end point. Results obtained up to 52 MPa have been compared with published data. (14 refs.)

76600 Calculation of vapour-liquid equilibria with equations of state from the extended van-der-Waals theory. II. Application of the equation to mixtures. G.Hecht, J.Kaiser, M.Walter.

Chem. Tech. (Germany), vol.35, no.4, p.209-11 (April 1983). In German. For pt.I see ibid., vol.35, p.37, (1983). For an equation of state derived from an extended van der Waals theory a set of mixing rules for multicomponent mixture constants is introduced. This enables the prediction of vapour liquid equilibria, as tested for some binary mixtures. For mixtures of n-alkanes and of H₂ with n-alkanes two correlations are proposed for the binary interaction parameters. The results of boiling pressure calculations show a degree of accuracy that would be sufficient for most technological cases. (53 refs.)

76601 Drop-to-filmwise condensation transition: heat transfer measurements for ethanediol. S.A.Stylianou, J.W.Rose (Dept. of Mech. Engng., Queen Mary Coll., Univ. of London, London, England).

Int. J. Heat & Mass Transfer (GB), vol.26, no.5, p.747-60 (May 1983). Measurements of vapour-to-surface temperature difference and heat flux are reported for dropwise, mixed and film condensation of ethanediol on an oleic acid-promoted copper surface and on a pte-coated surface. Tests were carried out at seven vapour temperatures (pressures) in the range 386K (3.8 kPa) to 440K (35.6 kPa). Air, ethanediol and water were used as coolants. At low and moderate cooling intensities dropwise condensation was observed for both surfaces and the $\Delta T-Q$ data for the two surfaces were in good agreement with each other and with dropwise condensation theory. At higher cooling intensities transition to mixed condensation was observed in the case of the pte surface. This was accompanied by departure from the theoretical $\Delta T-Q$ curve and the heat flux passed through a maximum with increasing cooling intensity. In the case of the oleic acid-promoted copper surface, ideal dropwise behaviour persisted to somewhat higher values of ΔT and Q before abrupt transition to film condensation occurred. The post transition filmwise data were in good agreement with the Nusselt theory. For both surfaces, reversion to ideal dropwise condensation occurred as the cooling intensity was reduced. Two possible mechanisms for the transition process are suggested. (9 refs.)

64.70H Solid-vapour transitions

76602 Vaporization study on the niobium-oxygen solid solution by mass-spectrometric method. T.Matsui, K.Naito (Dept. of Nuclear Engng., Nagoya Univ., Nagoya, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.178-86 (April 1983). The vapor pressures over the niobium-oxygen solid solution were measured by mass-spectrometric method in the temperature range 2091-2379K. The main vapor species were observed to be NbO(g) and NbO₂(g). The solidus line of the niobium-oxygen solid solution and the solubility limit of oxygen in niobium metal at high temperatures were determined from the vaporization behavior. The partial pressure of oxygen was calculated as a function of temperature and O/Nb composition from the partial pressures of NbO(g) and NbO₂(g), from which the partial molar enthalpy and entropy of oxygen in the niobium-oxygen solid solution were determined. The compositional dependence of the partial pressure of oxygen was observed to obey the Henry's law at low oxygen concentrations in niobium metal less than about 5 at.%. (32 refs.)

76603 Mass spectrometric study on the vaporization of ternary compounds PuM₂C(M=Fe, Co, Ni). Y.Suzuki, Y.Arai, T.Ohmichi, T.Sasayama (Div. of Nuclear Fuel Res., JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.187-91 (April 1983). The thermochemical properties of ternary compounds PuFeC₂, PuCoC₂ and PuNiC₂ were investigated in the temperature range 1420-1853K by means of the Knudsen effusion mass spectrometric technique. The peritectic reactions at 1650, 1610 and 1670K were suggested for these three compounds, respectively. Below the peritectic temperature, their vaporization process was incongruent, as the vapor pressures of Fe, Co and Ni were much higher than that of Pu. The free energies of formation of PuFeC₂, PuCoC₂ and PuNiC₂ have been determined from the vapor pressure data. (11 refs.)

Microstructures developed by solid-solid phase transformations)

76604 High-pressure and high-temperature crystallographic study of the gillespite I-II phase transition. R.M.Hazen, L.W.Finger (Geophys. Lab., Carnegie Instn. of Washington, Washington, DC, USA).

Am. Mineral. (USA), vol.68, p.595-603 (May-June 1983). Crystal structures of gillespite, BaFeSi₄O₁₀ which has a reversible first-order phase transition at 18 kbar, were refined from data collected at 1 bar and 9, 21, and 45 kbar. Silicate-layer topology is constant through the transition, but

coordination of barium increases from 8 to 10. The almost perfect square-planar coordination group of iron in gillespite I ($\text{Fe-O}=1.98 \text{ \AA}$) changes to a flattened tetrahedron with two additional long Fe-O bonds ($\sim 3 \text{ \AA}$) in gillespite II. The volume discontinuity at the gillespite I-II transition is best described as a consequence of the increased coordination of barium and iron. Unit-cell parameters of gillespite were measured under nine high-pressure and fourteen combined high-pressure, high-temperature (PT) conditions. The Clausius-Clapeyron slope of the transition is $27 \pm 9 \text{ bar/}^\circ\text{C}$, which is similar to the slope of gillespite-I isochores. On the basis of these observations, the behaviour of the gillespite I-II transition is consistent with a geometrically controlled phase transformation, in which the size of the barium site is the critical dimensional factor.

76605 Physical model of plasticity of a transition. V.A.Ermolaev, V.A.Likhachev (A.A. Zhdanov State Univ., Leningrad, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.693-700 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A model is proposed to account for the plasticity of a phase transition. Expressions are obtained for the macroscopic distortion as a function of the applied stresses. An allowance is made for the contribution to the macroscopic accommodation effect at the transition front. The results are compared with the published experimental data. (17 refs.) A.T.

76606 A study of solid and liquid carbon tetrafluoride using the constant pressure molecular dynamics technique. S.Nose, M.L.Klein (Chem. Div., Nat. Res. Council of Canada, Ottawa, Ontario, Canada). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6928-39 (1 June 1983). The constant pressure molecular dynamics technique originally proposed by Andersen to study fluids and subsequently generalized by Parrinello and Rahman (1980-82) to deal with crystals of arbitrary symmetry has been further extended to treat molecular systems. As a pedagogical example designed to illustrate the utility of this approach, the authors have investigated the properties of carbon tetrafluoride in its condensed phases using an intermolecular potential based upon atom-atom interactions. In particular, they have explored the effect of changes in temperature and pressure on the orientationally ordered low temperature monoclinic solid. As in the real crystal, isobaric heating to sufficiently high temperature causes the ordered phase to transform spontaneously to a noncubic orientationally disordered phase. The properties of this disordered phase are also examined along with those of the liquid. The atom-atom potential appears to correlate a wide range of experimental data. The possible role of the electrostatic octopole-octopole interactions is also discussed briefly. (44 refs.)

76607 Jahn-Teller phase transitions in RbCuCl_3 . M.Harada (Res. Reactor Inst., Kyoto Univ., Osaka, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1646-57 (May 1983). The phase transition at 66°C in RbCuCl_3 has been investigated by X-ray diffraction methods. Structure analyses have been carried out using the topographic data. For high-temperature structure, three equally plausible space groups $P6_3/\text{mmc}$, $P6_2c$ and $P6_1mc$ have been examined by a block diagonal least squares refinement. The room-temperature structure has the superstructure with the lattice parameter doubled along the b -axis and the space group is Pbcn . The mode analysis of the Jahn-Teller active mode was carried out and the intensity distribution of the superlattice reflections was consistent with the atomic shifts corresponding to the zone boundary M_4^+ -mode. There exists the second-order piezodistortive coupling between the antiferrodistortive static displacements and the homogeneous strains. From this coupling, the precise temperature dependence of the superlattice reflection is derived. (19 refs.)

76608 Orientation relation in the pressure-induced transition $\text{B1} \rightarrow \text{B2}$ of RbCl observed by an X-ray four-circle diffractometer. H.Fujiwara, N.Nakagiri, M.Nomura (Dept. of Materials Sci., Hiroshima Univ., Hiroshima, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1665-8 (May 1983). The orientation distribution of the $\{110\}$ diffracted line of the pressure-induced B2 phase of RbCl after $\text{B1} \rightarrow \text{B2}$ transition was measured with an X-ray four-circle diffractometer on which the Merrill-Bassett type diamond anvil pressure cell was mounted. Judging from the $\{110\}$ pole figure of the B2 phase, the center of which is the $[100]$ axis of the B1 phase, the orientation relation was $[111](\text{B2})//[100](\text{B1})$ and $[100](\text{B2})//[111](\text{B1})$. The result agreed with that obtained by Okai from X-ray diffraction photograph.

76609 Structural phase transition of layer compound $(\text{C}_2\text{H}_5\text{NH}_3)_2\text{FeCl}_4$. T.Suzuki, M.Yoshizawa, T.Goto, T.Yamakami, M.Takahashi, T.Fujimura (Res. Inst. for Sci. Measurements, Tohoku Univ., Sendai, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1669-75 (May 1983). The sequence of the structural phase transitions of the layer compound $(\text{C}_2\text{H}_5\text{NH}_3)_2\text{FeCl}_4$ has been determined with the ultrasonic, dielectric and polarized microscope measurements as following: Phase I (D_{6h}^{17})-(378.8K)-Phase II (D_{2h}^{18})-(203.5K)-Phase III-(133.7K)-Phase IV. The set of the critical exponents obtained with ultrasonic methods are explained by the results of the renormalization group theory on the three dimensional XY model. The ferroelastic domains are observed in the phase II and phase III. The anomaly of the dielectric constant is found near the II-III phase transition point. (17 refs.)

76610 Observations on the phase transition in quartz by synchrotron-radiation X-ray topography. A.Zarka (Lab. de Mineralogie-Cristallographie, Univ. Pierre et Marie Curie, Paris, France). *J. Appl. Crystallogr. (Denmark)*, vol.16, pt.3, p.354-6 (1 June 1983). By use of a high-temperature camera designed for in situ synchrotron-radiation X-ray topography the α - β transition was investigated in a Z-cut synthetic-quartz sample. Preliminary dynamical observations on movement of the boundaries between α and β phases and α_1 and α_2 domains are reported. (11 refs.)

76611 On 'forbidden' reflections in calcia- and yttria-stabilized zirconia (CSZ and YSZ). L.H.Schoenlein, A.H.Heuer (Dept. of Metall. & Materials Sci., Case Western Reserve Univ., Cleveland, OH, USA). *J. Appl. Crystallogr. (Denmark)*, vol.16, pt.3, p.357 (1 June 1983). In an earlier paper (see Schoenlein, Hobbs & Heuer, vol.13, p.375-9, 1980, henceforth referred to as SHH), the authors suggested that reflections 'forbidden' for both cubic (c) and tetragonal (t) ZrO_2 but occasionally present in diffraction patterns from stabilized ZrO_2 crystals containing t precipitates (CSZ and YSZ), e.g. Fig.5 (CSZ) of SHH, could be attributed to transformation of the t precipitates to monoclinic (m) symmetry. They now consider the monoclinic symmetry of the transformed particles unlikely and suggest that transformation to a new polymorph of ZrO_2 with orthorhombic (o) symmetry had occurred; o - ZrO_2 can form from t - ZrO_2 by a stress-induced diffusionless transformation (Schoenlein, 1982; Schoenlein, Ruhle & Heuer, 1983). (3 refs.)

76612 Critical point of isostructural phase transition in photomodified anthracene. I.L.Aptekar', A.E.Galashin (Inst. of Solid State Phys., Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.7, p.314-18 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.256-9 (5 Oct. 1982). [received: May 1983] An isostructural phase transition (IPT) is observed under certain temperatures and UV radiation intensities in a photomodified anthracene (dianthracene) crystal. The IPT curve, which ends at the critical point, and the coordinates of this point ($T_c=620 \pm 20\text{K}$, $I_c=70^{+9.0}_{-5.3}$ photons/ cm^2s) are calculated from the experimental data. (5 refs.)

76613 Peculiarities of phase transitions and physical properties in $(\text{NH}_4)_2\text{SbF}_6$. L.M.Avkhshtem', R.L.Davidovich, L.A.Zemnukhova, P.S.Gordienko (Inst. of Chem., Acad. of Sci., Vladivostok, USSR), V.Urbonavičius, J.Grigas. *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.483-8 (1 April 1983). The dynamics of the $(\text{NH}_4)_2\text{SbF}_6$ crystal lattice showing the superionic phase transition is studied in a broad temperature interval by NMR and NQR methods, together with electrophysical and calorimetric properties. The investigations establish the ionic state of the axial fluorine atom in relation to equatorial atoms in the $[\text{SbF}_6]^{2-}$ complex. The successive phase transitions are revealed and the mechanism of the phase transitions is elucidated. The phase transitions are caused by the reorientation movements of NH_4 and $[\text{SbF}_6]^{2-}$ groups. The authors also describe the influence of water solution inclusions in the crystal on the superionic phase transition. (9 refs.)

76614 Jahn-Teller transition in NdMnO_3 . N.Kamegashira, Y.Miyazaki (Dept. of Materials Sci., Toyohashi Univ. of Technol., Toyohashi, Japan). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K39-42 (16 March 1983). The Jahn-Teller type phase transition is firstly identified in neodymium manganite near 1100K based on the results of measurements of electrical conductivity, high temperature X-ray diffractometry, and differential thermal analysis (DTA). (14 refs.)

76615 High-angle grain-boundary premelting transition: A molecular-dynamics study. G.Ciccotti, M.Guillope, V.Pontikis (Section de Recherches de Metall. Phys., CENS, Gif-sur-Yvette, France). *Phys. Rev. B (USA)*, vol.27, no.9, p.5576-85 (1 May 1983). The authors studied the structure and self-diffusion in the FCC $[001](310)2=5$ coincidence high-angle tilt grain boundary by molecular-dynamics simulation. The calculations have been performed at various temperatures and fixed reduced number density, $\rho=0.984$, using Lennard-Jones (12-6) pair-interaction potential. The temperature dependence of the local thermodynamic properties in a small region around the grain boundary clearly points out that a structural transition occurs well below the melting point ($T_{\text{trans}} < 0.5T_m$, with T_m the melting-point temperature). This transition appears to be very smooth and indicates the onset of a partially disordered structure inside the boundary which goes continuously to the liquid at the melting temperature. The thickness of the region affected by the transition grows very slowly with increasing temperature and finally, due to the finite size of the simulated system, causes the migration of the grain boundary. In their simulation this happens for $T \sim 0.9T_m$. The self-diffusion coefficient, D_{GB} , in the grain boundary has a value comparable to, although definitely lower than, that of the quenched liquid at the corresponding temperature and density. Like the structural properties, D_{GB} goes continuously to the liquid value at $T=T_m$. (27 refs.)

76616 Multilayered polytypes in boron nitride. A.V.Kurdyumov, G.S.Oleinik, N.F.Östrovskaya, A.N.Pilyankevich, S.N.Gromyko, I.N.Frantsevich (Inst. of Problems in Materials Sci., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.575-6 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.66-8 (July 1982). [received: April 1983] In the present work, in which the authors have investigated the structural features of the wurtzite-sphalerite transformation, they discovered for the first time, the formation of multilayered polytypes of boron nitride. For the investigation they used transmission electron microscopy of thin chips of particles removed from the fracture surface of polycrystalline sinter cakes on a carbon replica. A dispersed powder of wurtzite boron nitride, was subjected to sintering at a pressure of 77 kbar and temperatures of 1400-1800 $^\circ\text{C}$ to produce only a partial phase transition of the wurtzite-sphalerite type. (5 refs.)

76617 Surface second-order phase transitions conserving the number of atoms in a unit cell. I.P.Ipatova, Yu.E.Kitaev, A.V.Subashiev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1880-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3311-17 (Nov. 1982). [received: May 1983] A group-theory analysis is given of the possible changes in the lattice symmetry in second-order phase transitions on an atomically clean surface, which conserve the number of atoms in a unit cell. Eighty two period groups in three-dimensional space were used to describe the symmetry of the surface layer affected by the change in structure. For comparison, an analysis was also made of the possible changes in symmetry in second-order phase transitions in purely two-dimensional systems. Phase transitions occurring in the Potts model were identified. (18 refs.)

76618 Influence of isotopic substitution on the $\text{T} \rightarrow \text{M2}$ phase transition in $\text{V}_{1-x}\text{Fe}_x\text{O}_2$ single crystals. E.I.Terukov, M.Wolf, W.Reichelt, H.-P.Bruckner, W.Bruckner, H.Oppermann (Central Inst. of Solid State Phys. & Materials Sci., Acad. of Sci., Dresden, Germany). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1946-7 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3426-8 (Nov. 1982). [received: May 1983] The authors carried out an experimental study of the isotopic replacement of ^{16}O with ^{18}O in iron-doped VO_2 single crystals, and attempted to carry out a critical analysis of the experimental results associated with the $\text{T} \rightarrow \text{M2}$ phase transition. The $\text{V}_{1-x}\text{Fe}_x\text{O}_2$ crystals were prepared by the method of chemical transport reactions in a closed chamber using TeCl_4 as the transport gas. The temperature of the $\text{T} \rightarrow \text{M2}$ phase transition was determined by measuring the temperature dependence of the magnetic susceptibility. The absolute values of this susceptibility at 223 and 173K were used to find the concentration of iron in $\text{V}_{1-x}\text{Fe}_x\text{O}_2$ samples. The results obtained were confirmed by the results of an activation analysis. The authors report that the observations militate strongly against the spin Peierls model for the explanation of the $\text{T} \rightarrow \text{M2}$ phase transition. (7 refs.)

- 76619 Phase transitions in tetragonal CdP₂.** A.U.Sheleg, V.P.Novikov (Inst. of Solid-State & Semiconductor Phys., Acad. of Sci., Minsk, Belorussian SSR). *Sov. Phys-Solid State (USA)*, vol.24, no.11, p.2000-1 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3508-11 (Nov. 1982). [received: May 1983]
X-ray diffraction is employed to study the phase transitions in CdP₂. The investigation reveals five complex anomalies, the most characteristic feature of which is a plateau in temperature dependences of the lattice parameters. These features are manifested by the temperature dependences of the thermal expansion coefficients in the form of doubled λ -like peaks. The studies lead to the conclusion that the phase transitions occur as a single process associated with a cascade of superstructures which are separated by intermediate incommensurate phases. (18 refs.)
- 76620 Role of the surface energy in phase transitions with two order parameters.** A.N.Semenov, F.M.Terent'ev, A.V.Chubukov (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys-Solid State (USA)*, vol.24, no.12, p.2111-12 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3704-6 (Dec. 1983). The authors consider the simplest model with two order parameters, i.e. the Lifshitz model, and take into account the spatial inhomogeneity of the order parameters related to the bounded nature of the sample and the surface energy. They show that such conditions may compensate for the shortcomings of this simple model and may yield a description of a wider class of effects without even inclusion of higher powers in the free energy expansion in terms of the order parameters. (9 refs.)
- 76621 Structural changes of a piezoelectric crystal BaZnGeO₄ on thermal phase transition.** K.Iijima, F.Marumo (Res. Lab. of Engng. Materials, Tokyo Inst. of Technol., Yokohama-shi, Japan), H.Takei. *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.2, p.67-72 (1983). In Japanese.
Structural changes on thermal phase transition have been investigated by X-ray diffraction technique, on a piezoelectric crystal BaZnGeO₄. Space groups and cell dimensions are: $P6_322$, $a=5.407(2)$ Å and $c=8.975(5)$ Å (at 900°C) for phase I, and $P6_3$, $a=9.320(1)$ Å and $c=8.866(5)$ Å (at 420°C) for phase II. The lattice vectors of phase I and phase II are in the relations, $a_1=(2a_{11}+b_{11})/3$, $b_1=(b_{11}-a_{11})/3$ and $c_1=c_{II}$. The change in intensities of superlattice reflections with temperature indicates an abrupt change of the structure at the phase transition point between the two phases. At 420°C, 710°C, 800°C and 900°C, the crystal structures were refined with single-crystal X-ray diffraction data to the final R values of 0.076, 0.062, 0.052 and 0.061 for 575, 417, 138 and 132 observed reflections, respectively. The crystal has a stuffed structure derived from the high tridymite frame-work with Ba²⁺ ions at the large interstices between the six-membered rings of ZnO₄ and GeO₄ tetrahedra. (14 refs.)
- 76622 The β - α transition in rapidly quenched Sn-Ge alloys.** W.M.Galleneault, R.W.Smith (Dept. of Metall. Engng., Queen's Univ., Kingston, Ontario, Canada).
Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.387-96
Dilute Sn-Ge alloys were prepared as ribbons by melt-spinning using a 4" copper drum. They were then transformed into grey tin at 242K in the as-cast-condition, and after annealing. It is shown that germanium: (1) when in solid solution impedes the β - α transformation; (2) when in solid solution cannot effect nucleation; and (3) has a solubility in α -Sn in excess of 1 wt.% Ge. In addition it is proposed that β - α transformation is restricted because the presence of germanium strengthens the β -Sn matrix. (12 refs.)

64.70M Transitions in liquid crystals

- 76623 Reentrant phase transition of chiral smectic C liquid crystal in electric field.** M.Yamashita, H.Kimura (Dept. of Appl. Phys., Nagoya Univ., Nagoya, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1509-11 (May 1983).
The reentrant behaviour (Sm C-Sm C*-Sm C-Sm C*) observed experimentally in an electric field near the chiral smectic C to smectic A phase transition point is investigated. That curious phenomenon is attributed to the non-linear excitation of the turn of the director field in the smectic C phase. Similar behaviour near the Lifshitz point in the magnetic field versus temperature plane is also explained by that excitation. (11 refs.)
- 76624 Crossover between two- and three-dimensional melting in a smectic-B-smectic-A phase transition in BBOA.** S.M.Stishov, S.N.Nefedov, A.N.Zisman (Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.8, p.348-52 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.8, p.284-7 (20 Oct. 1982). [received: June 1983]
It is established that the curve of the first-order of phase transition smectic-B(S_B)-smectic-A(S_A) in *N*-(4-*n*-butyloxybenzylidene)-4-*n*-octylaniline (BBOA or 40.8) terminates at the end critical point (ECP), coalescing with the curve of the second-order phase transition smectic-A-nematic (N). An increase in the volume ΔV and entropy ΔS jumps on the S_B-S_A transition line with an increase in pressure is attributed to the crossover between two- and three-dimensional melting. (9 refs.)
- 76625 Shear flow induced cholesteric-nematic transition.** G.Derfel (Inst. of Phys., Tech. Univ. of Lodz, Lodz, Poland). *Mol. Cryst. & Liq. Cryst. Lett. (GB)*, vol.92, no.2, p.41-7 (1983).
It is shown that the shear flow induced cholesteric-nematic transition occurs if the helix axis is normal to the shear plane and the shear rate exceeds a critical value. (3 refs.)
- 76626 Phase characterization and enthalpies of selected disubstituted biphenylcyclohexanes.** H.J.Muller, W.Haase (Inst. fur Phys. Chem., Tech. Hochschule Darmstadt, Darmstadt, Germany). *Mol. Cryst. & Liq. Cryst. Lett. (GB)*, vol.92, no.2, p.63-8 (1983).
The data from DSC-thermal analysis of a selected number of disubstituted biphenylcyclohexanes is reported. All nonpolar compounds in the series exhibit smectic B-phases, whereas the polar members with e.g. halogenes or cyano groups either only occur in the nematic phase or nematic and smectic A-phase. The phase behaviour and the enthalpies of transition are discussed. (6 refs.)

64.70P Glass transitions

- 76627 The influence of thermodynamic interactions on the glass transition of poly(vinyl chloride)-benzylbutylphthalate mixtures. S.K.Roy, G.R.Brown, L.E.St.-Pierre (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada). *Int. J. Polym. Mater. (GB)*, vol.10, no.1, p.13-20 (1983).
- The glass transition temperature and the interaction parameters, χ , for poly(vinyl chloride) plasticized with benzylbutylphthalate have been determined over a wide range of concentrations. The classical iso-free volume theory of the glass transition fails to explain the experimental results. However, Kovacs' modified iso-free volume theory with the addition to the free volume of an excess volume of mixing based on the χ parameter suitably rationalizes the experimental values. (15 refs.)
- 76628 Orientational effect of the extensional flow field on solutions of rigid rodlike macromolecule—disappearance of the isotropic to nematic phase transitions. M.Mansuripur (Xerox Corp., Palo Alto Res. Centre, Palo Alto, CA, USA). *Int. J. Multiphase Flow (GB)*, vol.9, no.3, p.299-307 (June 1983).
- The effect of steady state uniaxial extensional flow on a solution of rigid rodlike macromolecules is theoretically studied. The mean field theory of Maier and Saupe is extended to cover situations in which the macromolecular solution is subjected to an extensional flow field. It is found that for a given solution a critical flow gradient exists beyond which the first order nematic-isotropic phase transition, which is typical of such solutions in the absence of flow, disappears. A similar result is obtained when the theory of Onsager is applied to the problem. Order parameter as a function of flow gradient is calculated and it is shown that the contribution of flow to the ordering of macromolecules is most significant when the stationary solution is isotropic but close to the transition point. (17 refs.)
- 76629 Constant-pressure simulation of silica. S.K.Mitra (Dept. of Computer Sci., Univ. of Reading, Reading, England). *Philos. Mag. B (GB)*, vol.47, no.5, p.L63-7 (May 1983).
- The results of molecular dynamics simulations of silica at different constant pressures are reported. These are compared with the constant-volume simulation results of the same system. The thermodynamic properties of these simulations were found to be dependent on the condition imposed on the system. The lowering of constant pressure on the system decreases its fictive glass-transition temperature. The structural properties of the simulated glasses were found to be less sensitive to these external conditions. (3 refs.)

64.75 SOLUBILITY, SEGREGATION, AND MIXING

- 76630 Vacancy pump as a mechanism of growth of precipitates during precipitation of solid solutions. G.G.Samsonide, A.N.Orlov, Yu.V.Trushin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.676-84 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- An analysis is made of the growth of spherically symmetric precipitates of a new phase in a substitutional solid solution. This is done using a vacancy pump model in which vacancy-impurity complexes are the agents which carry mass to precipitates. A method is suggested for solving the balance equations for impurity atoms, vacancies, and complexes in the absence of a local equilibrium of their concentrations. The dependences of the concentrations of complexes and vacancies on the coordinate r and on the time t are found in two limiting cases of long and short precipitate formation times. An expression is obtained for the rate of growth of a precipitate valid over periods of practical interest. (6 refs.) A.T.
- 76631 Dissolution of vanadium carbide in steel, in the case of formation of a ferrite layer at the interface. V.V.Popov, D.A.Emel'yanov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.685-92 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- A theoretical analysis is made of the process of multicomponent diffusion during dissolution of vanadium carbide in steel in the case of formation of a ferrite layer at the interface. Expressions are obtained for the distributions of the concentrations of the components in the matrix and of the amounts of the diffused matter, as well as for the kinetics of dissolution of the precipitate.

The values of the interface concentrations are found by a method involving simultaneous solution of thermodynamics equations and of the mass balance equations. A theoretical calculation is made of the distributions of the concentrations in the diffusion zone and the results of calculations and experiments are compared. (17 refs.) A.T.

- 76632 Investigation of the precipitation of supersaturated solid solutions in alloys of magnesium with dysprosium. L.L.Rokhlin (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.733-8 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- Precipitation of supersaturated solid solutions of dysprosium in magnesium was found to occur in three stages corresponding to ordering, formation of platelet crystals of a nonequilibrium phase with the orthorhombic lattice, and formation of large platelet crystals of the equilibrium phase. (4 refs.) A.T.
- 76633 The role of solitons and the kinetics of precipitate growth in boron doped silicon-germanium alloys. N.Savides (School of Phys., Univ. of Sydney, Sydney, NSW, Australia). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2402-6 (May 1983).
- The time dependence of the thermoelectric transport properties of boron doped $\text{Si}_{10}\text{Ge}_{90}$ alloys has been investigated for times between 1 and 8700 h at an isothermal heat treatment temperature of 1100 K. Changes in the Seebeck coefficient, electrical resistivity, and carrier concentration which result from the precipitation of boron are reported. Three distinct stages are observed in the precipitation process: (a) an initial stage of precipitate zone growth lasting for about 1000 h characterised by a parabolic rate law, (b) a final stage commencing after about 4000 h and obeying the conventional Lifshitz-Slyozov post nucleation rate law, and (c) a lengthy intermediate stage lasting for about 3000 h in which the transition from initial to final stage takes place. A recently proposed soliton model for the kinetics of precipitate growth in binary phase systems is found to correctly reproduce the experimental observations. It is also reported that the precipitation process is reversible and the precipitated boron can be put back into solid solution by high temperature annealing. (16 refs.)
- 76634 Liquid immiscibility in the systems $\text{X}_2\text{O}-\text{MO}-\text{B}_2\text{O}_3-\text{SiO}_2$ ($\text{X}=\text{Na}, \text{K}; \text{M}=\text{Mg}, \text{Ca}, \text{Ba}$) and $\text{Na}_2\text{O}-\text{MgO}-\text{BaO}-\text{B}_2\text{O}_3-\text{SiO}_2$. P.Taylor, A.B.Campbell, D.G.Owen (Atomic Energy of Canada Ltd., Whiteshell Nuclear Res. Establish., Pinawa, Manitoba, Canada). *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.347-51 (May 1983).
- The limits of miscibility at 650°C were determined for compositions with the mole ratio $\text{SiO}_2/\text{B}_2\text{O}_3=1.07$ in the systems $\text{X}_2\text{O}-\text{MO}-\text{B}_2\text{O}_3-\text{SiO}_2$ ($\text{X}=\text{Na}, \text{K}; \text{M}=\text{Mg}, \text{Ca}, \text{Ba}$) and $\text{Na}_2\text{O}-\text{MgO}-\text{BaO}-\text{B}_2\text{O}_3-\text{SiO}_2$. The form of the miscibility gaps in the quaternary systems is similar to that previously described for the system $\text{Na}_2\text{O}-\text{ZnO}-\text{B}_2\text{O}_3-\text{SiO}_2$. The topography of miscibility gaps in systems of this type is discussed in detail. The extent of the miscibility gap is correlated with the polarizing power of each cation, X and M ($\text{Na} > \text{K}$ and $\text{Zn} > \text{Mg} > \text{Ca} > \text{Ba}$) both among the seven quaternary systems and within the single five-component system examined. The possibility of using empirical correlations observed among the quaternary systems to predict the behavior of other compositions, or of more complex systems, is explored. (23 refs.)
- 76635 Study on the formation of ternary compounds in titanium-nitrogen-hydrogen system. K.Uchida, B.Kyoh, K.Fuji (Dept. of Nuclear Engng., Kinki Univ., Higashiosaka, Japan), S.Imoto. *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.445-9 (1983). In Japanese.
- The titanium-nitrogen-hydrogen system has been studied by X-ray diffraction analysis and hydrogen analysis of specimens prepared by the reaction of non-stoichiometric titanium nitrides with hydrogen under a pressure of 6 mPa at 873K. In the specimens with nitrogen to titanium ratio less than 0.5, a ternary hcp compound was formed by absorption of hydrogen. The ternary compound had a wide range in both hydrogen and nitrogen contents and is considered as $\alpha\text{-Ti}$ dissolving hydrogen and nitrogen. It is concluded that the solubility of hydrogen in Ti is much increased by nitrogen dissolution. For the specimens with nitrogen to titanium ratio more than 0.6, the crystal structure remained unchanged after the hydrogenation, and the amount of hydrogen absorbed was considerably lower than that in the hcp ternary compound. The maximum solubility of hydrogen was found to be limited by $(\text{N}+\text{H})/\text{Ti}=0.9$, approximately. The enthalpy of the reaction producing the hcp ternary compound from hypostoichiometric TiN was determined by measuring hydrogen equilibrium pressures at various temperatures. The value was -66.15 kJ/mol. (10 refs.)
- 76636 High pressure reactions of oxometallics. VI. High pressure synthesis of mixed valence compounds $\text{VO}_{2-x}(\text{OH})_x$ with CaCl_2 -structure. K.-J.Range, R.Zintl (Inst. fur Anorganische Chem., Univ. Regensburg, Regensburg, Germany). *Mater. Res. Bull. (USA)*, vol.18, no.4, p.411-19 (April 1983). In German.
- Mixed valence compounds $\text{VO}_{2-x}(\text{OH})_x$ ($0.13 < x < 0.37$) were synthesized by high pressure-high temperature decomposition on ammonium metavanadate, NH_4VO_3 , at $p > 20$ kbar and $T = 700\text{--}800^\circ\text{C}$. The blue-black substances crystallize in the orthorhombic system, space group Pnmm. Single crystal data for $\text{VO}_{1.7}(\text{OH})_{0.3}$ ($a=4.5113(7)$ Å, $b=4.6303(8)$ Å, $c=2.8652(5)$ Å) confirmed the structure to be CaCl_2 type, a distorted variant of the rutile structure. On heating in air to about 250°C , $\text{VO}_{2-x}(\text{OH})_x$ is oxidized to VO_2 , which can conveniently be prepared from NH_4VO_3 in this way. (5 refs.)
- 76637 Relevance of the Cahn-Hilliard-Cook theory at early times in spinodal decomposition. J.Marro, J.L.Valles (Dept. de Fisica Teorica, Univ. de Barcelona, Barcelona, Spain). *Phys. Lett. A (Netherlands)*, vol.95A, no.8, p.443-6 (23 May 1983).
- The authors analyse Cook's equation for spinodal decomposition and compare its predictions with computer-simulation data to conclude its formal consistency with the observations at early times. They thus provide a simple reference for the analysis of experiments at early, observable times and for the development of theory at late times. (10 refs.)
- 76638 Solvus of $\text{KCl}:\text{Ca}^{2+}$ solid solution by flotation measurements of density of single crystals. V.B.Dudnikova, V.S.Urusov (Inst. of Geochem. & Analytical Chem., Moscow, USSR). *Phys. Status Solidi A (Germany)*, vol.76, no.1, p.217-21 (16 March 1983).
- Solvus of the system $\text{KCl}:\text{Ca}^{2+}$ is plotted within the concentration range from 3×10^{-2} to 2.5×10^{-1} mol.% at temperatures from 400 to 550°C . The decomposition of the solid solution after different regimes of thermal treatment is fixed by a change in density with the aid of the flotation procedure. A thermodynamic analysis of the experimental data evaluates the dissolution energy of the impurity, (1.37 ± 0.14) eV, and vibration entropy $(\Delta S_v/k = 7.7 \pm 2.3)$. (9 refs.)
- 76639 TEM precipitation studies in Te-rich as-grown PbTe single crystals. M.Muhlberg (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany), D.Hesse. *Phys. Status Solidi A (Germany)*, vol.76, no.2, p.513-24 (16 April 1983).
- In Te-rich as-grown PbTe single crystals small homogeneously distributed inhomogeneities are detected by TEM. They are identified as tellurium precipi-

piates. The largest of them permit the determination of their orientation: (001) Te||[111] PbTe, [110] Te||[110] PbTe. An estimation of the number of Te atoms absorbed by the precipitates results in values which are comparable with the maximum deviation from stoichiometry. The results allow a detailed comparison with literature data on precipitates in $A^{14}B^{VI}$ semiconductors. They support the idea of a diffusion-determined precipitation due to the retrograde course of the solidus line. (30 refs.)

76640 AgCl intrinsic properties modifications by ion implantation. J.Gisclon (Dept. de Phys. des Materiaux, Univ. Claude Bernard Lyon I, Villeurbanne, France), J.Bert, L.Vignal, Ch.Diane, J.Dupuy. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.125-34 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). The damage produced by energetic ion implantation (100 keV < E < 1 MeV) in AgCl (single crystals or thin films) is mainly due to the Ag⁺ sublattice. At liquid nitrogen temperature (LNT), the photographic process being blocked, the main defects created are identified as silver clusters. Their formation is analysed by means of the study of optical absorption spectra; this method permits cluster characterization with respect to elastic collision-energy. After a computer deconvolution of optical spectra, the authors are able to give some detail about intrinsic and extrinsic colloids. They then point out the formation conditions and the characterization of a metallic phase in the silver chloride matrix. (14 refs.)

76641 Thermal evolution of precipitated phases in Au implanted MgO single crystal. G.Aouchacra, G.Chassagne, J.Serughetti (Dept. de Phys. des Materiaux, Univ. Claude Bernard, Lyon I, Villeurbanne, France). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.189-96 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). MgO single crystals implanted with Au⁺ ions (180 keV, $6.10 \cdot 10^{17}$ ions cm⁻²) and annealed at temperatures between 25°C and 1100°C, have been analysed—by optical spectrophotometry—Rutherford backscattering (to confirm the effective presence and to study the distribution profile of Au atoms), and by TEM and X-ray diffraction (to identify the phase precipitated by thermal treatment). Thermal annealing between 550°C and 1100°C produced an optical absorption band located between 565 nm and 600 nm. This band can be attributed to a FCC Au precipitate with diameter varying from 50 to 200 Å. Larger metallic colloids 1000 Å are in simple orientation with the matrix. Annealing at temperatures higher than 500°C produces a supplementary optical absorption located at 425 nm. This band can be attributed to Au plasma resonance. After annealing for 15 min at 1100°C, a new phase is detected by X-ray diffraction and TEM and identified as Au₃Mg alloy with hexagonal structure. (16 refs.)

76642 Metallic alloy precipitates in high dose indium implanted MgO. A.Perez, M.Treilleux, L.Fritsch (Dept. de Phys. des Materiaux, Univ. Claude Bernard Lyon I, Villeurbanne, France), G.Marest. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.199-203 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). MgO implanted at room temperature with 150 keV In⁺ ions and doses ranging from 10^{15} to 10^{17} ions cm⁻² was studied by optical absorption and transmission electron microscopy (TEM). Creation of defects in the anionic sublattice (F⁻, F²⁻, F₂-centers) and in the cationic sublattice (V⁻-centers) are observed. Subsequent annealings of the implanted crystals have shown different behaviours depending on the implanted dose. For medium dose (2×10^{16} ions cm⁻²), the formation of In³⁺ species seems to be the preponderant phenomenon. At higher dose (8×10^{16} ions cm⁻²), metallic precipitates are formed between 400 and 700°C. The identification of these precipitates has been achieved using TEM: they are formed of a metallic alloy Mg₃In with a hexagonal structure and their orientation relationship with respect to the MgO matrix is: (001)_{Mg3In}//(111)_{MgO} and $[1120]_{Mg3In} // [111]_{MgO}$. (14 refs.)

76643 On the nature of the phases formed when metals are implanted with oxygen or nitrogen. R.Kelly (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.205-20 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Although the average composition change resulting from O or N implantation in a metal is small up to a dose of about 3×10^{16} ions/cm², the implanted atoms tend to be atomically mobile under the conditions used for bombardments and precipitation of an oxide or nitride can be expected. The object of this work is to explain what phases are formed. One model is based on the postulate that the precipitates are at the surface and have a high anion-to-cation ratio. The resultant phase therefore tends to be that which arises from the impact of any heavy particle on the surface of a high oxide or nitride. An alternative model is based on the postulate that the precipitates tend, independently of where they form, to be in qualified thermodynamic equilibrium with the metal. A consideration of the known examples of O or N implantation suggests that qualified thermodynamic equilibrium is the better guide to which phases are formed. (119 refs.)

76644 Accuracy of calculation of the heat of dissolution of hydrogen in nontransition metals. V.G.Orlov. *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1865-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3286-92 (Nov. 1982). [received: May 1983] The pseudopotential model of a metal is used to discuss the various contributions to the heat of dissolution Q of a hydrogen impurity in nontransition metals. The sensitivity of the results of the form of screening and the type of pseudopotential is investigated. The experimental values of Q for a solid solution phase of hydrogen in aluminum and magnesium are compared with the values calculated using various models. (26 refs.)

76645 Orientation of particles of a new phase appearing in crystals. A.B.Vasil'ev, S.F.Chernov (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2103-5 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3691-3 (Dec. 1983). The authors describe an investigation of the process of formation and orientation of particles of a new impurity phase in an anteprecipitate and in the matrix proper in the case of KCl (with 0.1 wt.% of SnBr₂ in the charge) and ZnO crystals. They determine the topography of the impurity distribution by vacuum decoration (with gold) and electron-microscopic examination; they also determined the orientation of the particles of the new phase by electron diffraction. (17 refs.)

76646 Interface spinodal decomposition in LPE In₂Ga_{1-x}As₂P_{1-y} lattice-matched to InP. H.Launois, M.Quillec, F.Glas, M.J.Treacy (CNET, Bagneux, France).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.537-44. Concentration modulations are presented in some LPE In₂Ga_{1-x}As₂P_{1-y} layers grown by liquid phase epitaxy on (001) InP. On the basis of thermal treatments and of different temperature growths, the authors show that this latter parameter determines the existence of the composition modulations. They propose an interpretation of these effects on the basis of liquid-solid interface spinodal decomposition. As a consequence, they have obtained homogeneous high mobility quaternary alloys ($\lambda = 1.3 \mu\text{m}$). (11 refs.)

64.80 OTHER PHASE PROPERTIES OF SYSTEMS

- 76647 Morphology of residual austenite in structural steels.** L.M.Utevskii, T.V.Eterashvili, R.I.Entin (Republican Centre of Electron Microscopy, Georgian Polytech. Inst., Tbilisi, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.816-18 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
 The morphology and distribution of residual austenite were investigated in structural steels 10Kh2G3M, 38KhS, and 33Kh3N2M. The study was carried out by electron microscopy and microdiffraction methods. The results indicated formation of layers of the residual austenite located in certain preferred positions (such as the boundaries of martensitic laths and packets). (8 refs.) A.T.
- 76648 Lattice-fringe imaging of precipitation-hardened cobalt rare-earth magnets.** J.Fidler (Inst. of Appl. & Tech. Phys., Tech. Univ. Wien, Wien, Austria). *Philos. Mag. A (GB)*, vol.47, no.5, p.L19-22 (May 1983).
 The different microphases of high coercivity (Co, Fe, Cu, Zr)₇Sm permanent magnets have been studied and characterized by means of high-resolution electron microscopy. From lattice-fringe images of the cellular microstructure the misfit of the crystal lattice parameter between the coherent cell boundary phase and the cell interior phase is determined. It is shown that the platelet phase within the cell interiors consists of a hexagonal Co₁₂Sm₂ layer. (7 refs.)
- 76649 Microstructures of rapidly solidified Fe-Al-Zr alloys.** A.N.Patel, L.F.Vassamillet, A.H.Clauer (Battelle Columbus Labs., Columbus, OH, USA).
 Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.259-63
 Rapidly quenched short fibers of FeAl and Fe-8Al-XZr (X=0.1,0.2,0.4, and 1) alloys were produced by the pendant drop melt extraction process, (PDME) to explore the feasibility of producing intermediate temperature, oxidation resistant iron base alloys. The fibers had a diameter of 20 to 50 μ m and ranged in length from 2-5 mm. The cooling rate was insufficient to retain zirconium in solution in the Zr-containing alloys, resulting in precipitates of the type Fe₃(Zr,Al) having differing compositions at the grain boundaries and within the matrix. No precipitates were observed in the FeAl alloys. The precipitates were uniform in distribution and size. Grain boundary precipitation and precipitate size both decreased with decreasing Zr contents. (3 refs.)
- 76650 Microstructure and properties of fine grained supersaturated Fe-C alloys.** B.L.Mordike, H.W.Bergmann (Inst. für Werkstoffkunde und Werkstofftech., Univ. of Clausthal, Clausthal, Germany).
 Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.423-7
 Rapidly quenched tapes of Fe-C-X alloys (X=Cr, Mn, Ni, Co, Al, Si) were produced by melt spinning. The hardness, ductility, grain size and micro and lattice structure were determined. The system Fe-2.1C-13Cr was chosen for further study. The transformation (isothermal and continuous) characteristics were determined for the as quenched and reannealed states. The results can be presented in the form of TTT diagrams and hardness measurements. (4 refs.)
- 76651 Microstructural study of devitrified amorphous alloys.** L.Vassamillet, R.Maringer, R.Carbonara, J.McCall (Battelle-Columbus, Columbus, OH, USA).
 Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.449-53
 Several amorphous alloys were subjected to thermal processing subsequent to their rapid solidification. These alloys have been characterized utilizing metallographic (optical, TEM, and SEM) and X-ray methods. Also, mechanical property evaluations have been made. The alloys exhibit extremely fine grain size; some have a high degree of preferred orientation and second-phase precipitates in the submicron size range. Most have good modulus, high yield and ultimate strength, high reduction in area but limited percent elongation. (no refs.)
- 76652 Microstructure and mechanical properties of laser-processed Ni-Al-Mo base alloys.** D.B.Snow (United Technol. Res. Center, East Hartford, CT, USA).
 Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.523-7
 The addition of molybdenum to nickel base superalloys which contain a γ' volume fraction of ≤ 0.35 allows them to be consolidated from powder by laser processing at solidification rates of $\sim 10^4$ C/s. The as-solidified microstructure of these alloys is dendritic, and consists of a fine dispersion ~ 20 nm cuboidal γ' in a supersaturated FCC γ matrix. When annealed at 500-700°C, additional age hardening occurs via the precipitation of ≤ 10 nm, Dia-structure Ni₃Mo, DO₂₂-structure Ni₃Mo and/or Pt₂Mo-structure Ni₃Mo. This combined strengthening by very fine γ' and Ni₃Mo dispersions in laser-processed material makes alloys of this type attractive for potential turbine disk applications. However, the 6-15 at% molybdenum required to prevent cracking during laser consolidation renders many of these alloys prone to an embrittling cellular phase transformation, $\gamma + \gamma' + \text{Ni}_3\text{Mo} \rightarrow \gamma + \text{orthorhombic Ni}_3\text{Mo}$, at temperatures of $\leq 900^\circ\text{C}$. (12 refs.)
- 76653 Transmission electron microscopy of RSP Fe/Cr/Mn/Mo/C alloy.** J.J.Rayment, G.Thomas (Materials & Molecular Res. Div., Univ. of California, Berkeley, CA, USA).
 Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.547-52
 Rapid solidification processing (RSP) has been carried out on an Fe/Cr/Mn/Mo/C alloy using both electron-beam melting and piston-and-anvil techniques. Preliminary TEM results show RSP produces a refined duplex microstructure of ferrite and martensite, with a typical ferrite grain size of 0.50-3.0 microns. This RSP microstructure is significantly different from that observed in the conventionally austenitized and quenched alloys—a lath martensitic microstructure with thin films of retained interlath austenite. The morphological change produced by RSP is accompanied by an increase in hardness from 48 R_c to 61 R_c (~ 480 to 720 VHN). It is intended to use electron-beam specimens to examine the potential beneficial effect of RSP upon sliding wear resistance and, by careful TEM studies, it will be possible

to characterize the microstructure and its role in the hardness and wear behavior of the RSP alloy. (10 refs.)

65.20 HEAT CAPACITIES OF LIQUIDS

- 76654 Modified Gruneisen and Anderson-Gruneisen relations for quasi-spherical molecular liquids.** B.K.Sharma (Dept. of Phys., Regional Coll. of Education, Bhubaneswar, India). *Pramana (India)*, vol.20, no.1, p.91-103 (Jan. 1983). [received: May 1983]
 The validity of the expression for the Gruneisen parameter of liquids has been tested by obtaining expressions for the heat capacity ratio, isothermal and adiabatic Anderson-Gruneisen parameters, C_p -parameter, Rao's (1941) acoustic parameter, Beyer's nonlinearity parameter, and relate them to the Gruneisen parameter. The calculated values for five liquefied gases comprising of quasi-spherical molecules are reasonably satisfactory and explain the experimental results for the variation of heat capacity ratio, Beyer's nonlinearity parameter and C_p -parameter with temperature for liquid state. It is shown that the isochoric temperature derivative of the sound speed, specified heat ratio and the compressibility are dominant factors with significant contribution for influencing the thermo-acoustic properties of liquids. (32 refs.)

65.40 HEAT CAPACITIES OF SOLIDS

(for specific heat of superconductors, see 74.30E; for specific heat of magnetic systems, see 75.40)

- 76655 Heat capacity, relative enthalpy, and calorimetric entropy of silicate minerals: an empirical method of prediction.** G.R.Robinson, Jr., J.L.Haas, Jr. (Nat. Center for the Thermodynamic Data of Minerals, US Geological Survey, Reston, VA, USA). *Am. Mineral. (USA)*, vol.68, p.541-53 (May-June 1983).
 A procedure to estimate the standard molar heat capacity, relative enthalpy, and calorimetric entropy of silicate minerals has been devised and evaluated. These are estimated by summing, in appropriate proportions, fictive molar isobaric heat capacities, relative enthalpies, and entropies evaluated for structural components of the mineral phases such as MgO-4, MgO-6 or MgO-8 where the Mg is in 4-, 6-, or 8-fold coordination, respectively. The fictive molar heat capacities and entropies were obtained from a large body of experimental calorimetric data on heat capacity, entropy, and relative enthalpy for minerals. The summation technique has a precision better than 2% for heat capacity and relative enthalpy, and 5% for entropy, relative to the data base, between 298 and 1500K. The accuracy of prediction of molar heat capacity and relative enthalpy for mineral phases and specific heat for rocks is expected to be within 3% using this technique. The accuracy of prediction of molar calorimetric entropy is expected to be within 5% using this technique.
- 76656 Lattice and Schottky contributions to the morphology of lanthanide heat capacities.** E.F.Westrum, Jr. (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA). *J. Chem. Thermodyn. (GB)*, vol.15, no.4, p.305-25 (April 1983).
 In this lecture paper the author focusses mainly on the Schottky contribution to heat capacity, mostly for its inherent interest, but also in a nontrivial way to utilize it as a tool to deduce the reliability of a scheme for the evaluation of the lattice contribution of the heat capacity, the latter step is seen as being essential in analyzing the morphology of the heat capacity curve. (54 refs.)
- 76657 Heat capacity and thermodynamic properties of molybdenum from 5 to 302K.** L.M.Khrilovich, I.E.Paukov (Inst. of Inorganic Chem., Novosibirsk, USSR). *J. Chem. Thermodyn. (GB)*, vol.15, no.4, p.333-7 (April 1983).
 The heat capacity of pure molybdenum was measured by adiabatic-shield calorimetry in the temperature range 5 to 302K; no transitions or thermal anomalies were found. At 298.15K, the heat capacity at constant pressure C_p , the entropy S° , and the function $[(G^\circ(T) - H^\circ(0))/T]$ have values (23.86 ± 0.03) , (28.56 ± 0.08) , and $-(13.16 \pm 0.03)$ J.K⁻¹.mol⁻¹ respectively.

The results are compared with earlier by other investigators values found. (5 refs.)

76658 Rb₂ZnCl₄: three heat-capacity anomalies due to soft-mode and commensurate-incommensurate transitions. T.Atake, K.Nomoto, B.K.Chaudhuri, H.Chihara (Dept. of Chem., Faculty of Sci., Osaka Univ., Osaka, Japan). *J. Chem. Thermodyn. (GB)*, vol.15, no.4, p.339-50 (April 1983). There are three phase transitions shown by Rb₂ZnCl₄. The transition temperatures, the enthalpies of transition, and the entropies of transition are (74.6±0.15)K, (30±1) J.mol⁻¹, (0.42±0.01) J.K⁻¹.mol⁻¹; (195.2±0.02)K, (6.2±0.9) J.mol⁻¹, (0.032±0.005) J.K⁻¹.mol⁻¹; (303.2±0.3)K, (222±7) J.mol⁻¹, (0.66±0.14) J.K⁻¹.mol⁻¹. The second transition shows a very sharp heat-capacity peak but the other two are much broader, being consistent with the soft-mode mechanism. Thermodynamic functions of Rb₂ZnCl₄ are tabulated. A comparison is made with the behaviour of ferroelectrics of the same type: K₂SeO₄ and Rb₂ZnBr₄. (45 refs.)

76659 Heat capacity of tetramethylammonium trichloromanganate(II) from 1.5 to 300K. A.G.Dunn, M.Jewess, L.A.K.Staveley, R.D.Worswick (Inorganic Chem. Lab., Univ. of Oxford, Oxford, England). *J. Chem. Thermodyn. (GB)*, vol.15, no.4, p.351-6 (April 1983). The heat capacity of tetramethylammonium trichloromanganate(II), N(CH₃)₄MnCl₃, from 1.5 to 300K, is reported. The principal novelty of the results is in the region above 52K, for which only a very small-scale plot has previously been published. From the results the authors estimate the anomalous molar entropy gain associated with the monoclinic-to-hexagonal transition (T_h=126K) as R is 2.8. (19 refs.)

76660 K₂SeO₄: calorimetric studies of two successive phase transitions. T.Atake, K.Nomoto, B.K.Chaudhuri, H.Chihara (Dept. of Chem., Faculty of Sci., Osaka Univ., Osaka, Japan). *J. Chem. Thermodyn. (GB)*, vol.15, no.4, p.383-94 (April 1983). The heat capacity of K₂SeO₄ was measured from 3 to 300K. The commensurate-incommensurate transition (so-called lock-in transition) showed a rather broad anomaly at (95.1±0.1)K. The enthalpy and entropy of transition are (1.1±0.2) J.mol⁻¹ and (0.012±0.002) J.K⁻¹.mol⁻¹, respectively. The incommensurate-normal transition has a heat-capacity maximum at (127.7±0.1)K and appears to be of second order; its enthalpy and entropy changes are (110±5) J.mol⁻¹ and (0.88±0.05) J.K⁻¹.mol⁻¹. Some thermodynamic functions are derived. (56 refs.)

76661 Heat capacity study of the phase transitions in As₂S₃ and As₄S₄. T.K.Chattopadhyay, E.Gmelin, H.G.von Schnering (Max-Planck-Inst. fur Festkörperforschung, Stuttgart, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.543-51 (16 April 1983). Heat capacity of As₂S₃ is measured in the range 100 to 500K. The structural phase transition (β to α) and the crystalline-to-plastic phase transition (α to γ) are investigated and these phase transition temperatures are determined to be (422±0.5) and (432±0.5)K, respectively. The results are compared with those of P₂S₅ which are recently studied. There is a strong similarity in the thermodynamic properties between the two compounds. The plastic phase of As₂S₃ can be retained down to (391±2)K with a hysteresis in the specific heat-temperature curve. Heat capacity of As₄S₄ is also measured in the range 100 to 600K. The structural phase transition temperature (α to β) and melting temperature are determined to be (340±2) and (582±1)K, respectively. As₄S₄ does not transform to a plastic state, and therefore, the melting entropy (54.32 J mol⁻¹ K⁻¹) is very high compared to the melting entropy (3.34 J mol⁻¹ K⁻¹) of As₂S₃. (15 refs.)

76662 Heat-capacity studies of crystal-field effects in dilute RRh₂B₄ compounds. H.B.Radousky, B.D.Dunlap, G.S.Knapp, D.G.Niarchos (Argonne Nat. Lab., Argonne, IL, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5526-9 (1 May 1983). Specific-heat data are presented for a number of compounds of the form R₂Y_{1-x}Rh₂B₄, where R=(Dy, Ho, Er, and Tm) is a rare-earth element and x=0.1. Schottky anomalies arising from crystal-field splittings of the rare-earth ions are analyzed using crystal-field parameters recently determined for ErRh₂B₄. Utilizing simple scaling arguments for the crystal-field parameters as the rare-earth ion is changed, a satisfactory explanation of the specific-heat data is obtained. (8 refs.)

76663 Magnetic field dependence of the electronic specific heat of TiBe₂: an estimate from magnetization data. F.Acker, R.Huguenin (Inst. de Phys. Experimentale, Univ. de Lausanne, Lausanne, Switzerland), J.L.Smith, G.R.Stewart. *Phys. Rev. B (USA)*, vol.27, no.9, p.5883-6 (1 May 1983). An estimate of the variation with magnetic field in the electronic specific heat of TiBe₂ is given. From the thermodynamic relationship $\partial S/\partial H = \partial M/\partial T$ and from M-vs-T data it follows that C/T (at T<2K) should remain constant within 0.2% for 0≤H≤40 kOe. A further increase in H up to 70 kOe should cause C/T to drop by about 10%. This is in fair agreement with recent experimental results for C/T (70 kOe)-C/T(0). The origin of the drop in C/T is still uncertain. Paramagnon theory gives no satisfactory fit of the high-field data. (18 refs.)

76664 Schottky anomaly and phase transition in the specific heat and in the spectra of K Dy(MoO₄)₂. I.E.Paukov, L.E.Reznik, G.I.Frolova (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1976-7 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3473-5 (Nov. 1982). [received: May 1983] Reports a continuation of the study of the effects of the crystal field on the specific heat and spectra of KLn(MoO₄)₂ compounds. This crystal is interesting because a unique phase transition of the Jahn-Teller type to an antiferro-distortion phase at ~14K was discovered in this compound. The authors determined the energies of all eight Stark components (Kramers doublets) of the ground state ⁶H_{15/2} of the Dy³⁺ ion in the crystal field of this material. This was done by investigating the ⁶F_{9/2}-⁶H_{15/2} transition using the absorption and luminescence spectra. The specific heat of a K Dy(MoO₄)₂ crystal was determined. A Schottky anomaly C_S(T) was found in the specific heat and attributed to the thermal population of the Stark levels. (8 refs.)

76665 Thermal properties of Cu₂SnS₄. M.I.Aliev, D.G.Arasly, T.G.Dzhabrailov (Inst. of Phys., Acad. of Sci., Baku, Azerbaijan SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1978-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3477-8 (Nov. 1982). [received: May 1983] The authors give the results of an experimental study of the thermal diffusivity α, specific heat C_p, thermal conductivity κ, and electrical conductivity σ of Cu₂SnS₄ in the temperature range 80-400K, which includes a phase transition point. (3 refs.)

76666 Specific heat of Co(Si_{1-x}Se_x)₂ and magnetic properties in weak fields. G.A.Petrakovskii, A.G.Klimenko, S.S.Aplesnin, F.S.Rakhmenkulov, A.V.Baranov (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2095-9 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3676-83 (Dec. 1983). The temperature dependences of the specific heat and weak-field magnetic properties were determined in the range of compositions 0≤x≤0.15. Structural and magnetic anomalies of the specific heat were determined. Low-temperature hysteresis and relaxation of the magnetization were studied. A comparison was made of the phase diagrams obtained experimentally and also theoretically by the Monte Carlo method. (16 refs.)

65.50 THERMODYNAMIC PROPERTIES AND ENTROPY

76667 Potentiometric study of the thermodynamic properties of intermetallic compounds Ca₂Ni₅. Structural interpretation. M.Notin, J.Hertz (Lab. de Thermodynamique Metall., Univ. de Nancy I, Vandœuvre-les-Nancy, France).

Acta Metall. (USA), vol.31, no.6, p.903-8 (June 1983). In French. The calcium activity was studied in the Ca₂Ni₅ alloys until the equilibrium with pure nickel in the range 1000-1350K by means of a (pure Ca) ||CaF₂|| (alloyed Ca) solid electrolyte cell. The nickel activity was deduced by Gibbs-Duhem integration and the integral quantities of formation of the CaNi₅, Ca₂Ni₇, CaNi₃, CaNi₂ intermetallic compounds were obtained. The structures of these phases have the same general formula N₅M_{2n-1}N_n^{*}. The change of the thermodynamic data with n is discussed. (15 refs.)

76668 Thermodynamics of ternary Fe-Co-N austenites. C.Ko, R.B.McLellan (Dept. of Mech. Engng. & Materials Sci., William Marsh Rice Univ., Houston, TX, USA).

J. Phys. & Chem. Solids (GB), vol.44, no.5, p.467-70 (1983). Gas-solid equilibrium measurements have been used to determine the variation with cobalt concentration in the range 0-9 at.% Co of the partial molar enthalpies and excess entropies in ternary Fe-Co-N austenites in the temperature range 1173-1503K. The resulting thermodynamic data show a relative invariance in these thermodynamic functions in excellent accord with the cell model for ternary solid solutions containing a substitutional and an interstitial species in which the presence of the substitutional species creates 'antitrapping' sites for interstitial atoms. (11 refs.)

76669 Thermodynamic measurements and modeling of (UC_{1-x}O_x). T.M.Besmann (Chem. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

J. Am. Ceram. Soc. (USA), vol.66, no.5, p.353-5 (May 1983). Measurements were made of (CO) pressure over (UC_{1-x}O_x) at 1823, 1773, 1673, 1573, and 1473K for various values of x, in the presence of (UC_{1.86}). The data were used to model (UC_{1-x}O_x) as a solid solution of (UC) and (UO₂), where ΔG²⁸ is represented by an expansion in two terms, the first of which is temperature-dependent. The model allows for the accurate prediction of chemical activities and phase equilibria in regions also containing (UC_{1.86}), (UO_{2-y}), (UC_{1.86})-(UO₂), and (UO_{2-y})-{U}. (24 refs.)

76670 Polynomial model for concentration and temperature dependence of excess thermodynamic functions. J.Velisek (Inst. of Phys. Metall., Czechoslovak Acad. of Sci., Brno, Czechoslovakia).

Kovove Mater. (Czechoslovakia), vol.21, no.2, p.105-14 (1983). A polynomial model has been developed which retains the simplicity of features of models based on the Newmann-Kopp's rule but which expresses more rigorously the temperature dependence of the excess thermodynamic data. For the metallic phases with high values of excess heat capacity their contribution to the temperature dependence of the excess enthalpy, entropy and free enthalpy data should be considered whenever it is possible. As shown by examples, the proposed model makes it possible to express the excess heat capacity (and therefore the excess enthalpy, entropy and free enthalpy) on temperature and concentration in a simple analytical form at least for ordinary binary systems. It gives a better approximation over the Neumann-Kopp's approach. (10 refs.)

76671 Calculation of activity coefficients of conduction electrons in metals and in semiconductors. A.G.Guy (Dept. of Phys. & Space Sci., Florida Inst. of Technol., Melbourne, FL, USA).

Solid-State Electron. (GB), vol.26, no.5, p.433-6 (May 1983). Previous work has demonstrated that an important thermodynamic property of the conduction electrons, their partial enthalpy h, can be calculated from experimental data on thermopower. It is shown here that useful approximate values of the activity coefficient, f_c, can be deduced for both metals and semiconductors from data on h. The validity of this deduction is verified by comparison with published experimental data on the variation of electrical potential with the amount of doping of n-type silicon. These data are also employed to estimate that the partial excess entropy makes a contribution of about 15% (compared to h) to the value of f_c. (17 refs.)

76672 Thermodynamic properties of dilute solutions of hydrogen in glassy Pd₈₀Si₂₀. R.S.Finocchio, C.L.Tsai, B.C.Giessen (Dept. of Chem., Northeastern Univ., Boston, MA, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.243-8. Equilibrium vapor pressures of dilute solutions of hydrogen in glassy Pd₈₀Si₂₀ have been measured from 10-90°C and at hydrogen pressures P of 1-100 torr. Under these conditions the ratio of hydrogen to alloy, x, as determined by a volumetric method, reaches a maximum value of 0.0070. Over this range of x, the system exhibits a positive deviation from Sieverts' law; isotherms were analyzed in terms of Lacher's modified statistical mechanical theory of hydrogen in palladium. The data were used to calculate relative partial molar enthalpies, excess entropies, and excess free energies for the formation of the solid solutions. The thermodynamic properties were found to vary with hydrogen content over the composition range studied. (11 refs.)

- A new method was developed for calculating the temperature coefficient of linear expansion α_t of silicate glass by structural and energy indices. The calculating formula has the following form: $\alpha_t = 0.31[2.21 + (106 - E_{av})F_{av}]T^{1/3}$, where E_{av} is the average value of the energy of the single cation-oxygen bond, F_{av} is the structural factor that characterizes the effect of the size and number of modifying cations in the glass on its properties, and T is absolute temperature. An example of calculating α_t of glaze and porcelain is given. (1 ref.)
- 76675 Influence of thermoelastic bending on photoacoustic experiments related to measurements of thermal diffusivity of metals. G.Rousset, F.Lepoutre (CNRS, Ecole Centrale des Arts et Manufactures, Chatenay-Malabry, France), L.Bertrand. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2383-91 (May 1983).
- In some photoacoustic experiments, thermoelastic bendings of solid samples produce strong signals which cannot be analysed by usual photoacoustic calculations. The authors propose a model that, using the thermoelastic equations, analytically explains the effect of this bending. It is found that the model agrees well with data obtained from an experiment sensitive to thermoelastic deformations only. Furthermore, the model is also consistent with previous piezoelectric-photoacoustic calculations. This experiment also leads to measurements of thermal diffusivities. (19 refs.)

- High accuracy (0.1%) linear thermal expansivity results are given for a copper-1.8 wt.% beryllium alloy in both the half-hard and precipitation-hardened conditions. These results, which are of technical importance for low temperature experiments, also show a small anomaly near 25K in the temperature dependence of the ratio of the alloy expansivity to that of copper. - The authors study two semidiscrete schemes for approximating the equations of linear thermoelasticity and obtain error estimates. For solving the semidiscrete problems at each time step, they give an iterative method. At each iteration, one must solve an elasticity problem and a thermal problem. (9 refs.)

Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981* (New York, USA: North-Holland 1982), p.231-4.
- In amorphous iron-chromium alloys, magnetic contraction is superimposed on the thermal expansion. Depending on the proportion of antiferromagnetic chromium, the resultant coefficient of expansion is either positive, negative or zero. The chromium content also changes the Curie temperature. Relaxation processes have a marked effect on the thermal expansion. Long term and short term expansion behaviour is compared and discussed. In addition the crystallization behaviour and mechanical properties of the alloys are reported. (6 refs.)

66.10 DIFFUSION AND IONIC CONDUCTION IN LIQUIDS

- 76679 Experimental determination of diffusion coefficients, viscosities, densities and refractive indexes of 11 binary liquid systems. W.Baldauf, H.Knapp (Inst. für Thermodynamik und Anlagentechnik, Tech. Univ. Berlin, Berlin, Germany). *Ber. Bunsenges. Phys. Chem. (Germany)*, vol.87, no.4, p.304-9 (April 1983).
- Diffusion coefficients in 11 binary liquid mixtures were determined as a function of temperature and composition with the dispersion method. Simultaneously the density, the kinematic viscosity and the refraction index were measured. The mixtures investigated were acetone-water, acetone-toluene, acetone-n-butylacetate, succinic acid-water, succinic acid-n-butylalcohol, n-butylalcohol-water, phenol-water, phenol-toluene, phenol-n-butylacetate, phenol-diisopropylether, and phenol-4-methyl-2-pentanone. (12 refs.)
- 76680 The ^2H thermal diffusion isotope effect in benzene and methanol. Ning-Yuan Richard Ma, A.L.Beyerlein (Dept. of Chem. & Geology, Clemson Univ., Clemson, SC, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.7010-11 (1 June 1983).
- Investigates the contribution of isotope mass distribution to the ^2H thermal diffusion isotope effect by measuring α (thermal diffusion factor) for the mixtures: benzene-benzene d_4 , benzene-*o* deuterobenzene, benzene-*p* deuterobenzene, methanol d_1 (CH_3OD)-methanol d_4 , and methanol-methanol d_1 (CH_3OD). There is a possibility that the interpretation of α for methanol d_1 mixtures may be complicated by hydrogen-deuterium exchange. However, the good agreement between the ^{13}C and ^2H self-diffusion coefficients for methanol indicate such isotope exchange does not contribute significantly to diffusion processes. (18 refs.)
- 76681 A concentration dependence of diffusion coefficients in Sn-Pb and In-Zn melts. G.P.Grinevich, V.I.Oglobyla, V.I.Loizovoi, L.P.Golovinski. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.692-6 (May 1983). In Russian.
- Concentration dependences of diffusion coefficients D of atoms are studied for ^{119}Sn , ^{125}Sb and ^{110m}Ag , ^{65}Zn in melts of Sn-Pb (400°C) and In-Zn (500°C), respectively, using simultaneous diffusion of several radioactive impurities in a vertical capillary specimen. An effect of a continuous decrease of D is found when the second component concentration increases. The experimental values of D are in good agreement with those calculated from the solid sphere liquid model. The statistic distribution of atoms relative to their sort is, probably, the most possible. (14 refs.)

(inc. viscosity of liquids)

- 76682** Viscosity of binary liquid mixtures in hard-sphere approximation. Harminder (Phys. Dept., Coll. of Home Sci., Punjab Agricultural Univ., Kaoni, Punjab, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.119-20 (Feb. 1983). Argon-krypton binary liquid mixture has been simulated as a hypothetical hard-sphere fluid, for its viscosity through conformal solution theory. The agreement between the experimental data and calculated values using Enskog theory is found to be excellent. (7 refs.)
- 76683** Effect of γ -irradiation on viscosity-temperature characteristics of blended oils. V.G.Thomas, S.B.Srivastava (Chem. Div., Bhabha Atomic Res. Centre, Bombay, India). *Indian J. Technol.*, vol.20, no.12, p.502-3 (Dec. 1982). [received: May 1983] The effect of γ -irradiation on the viscosity-temperature behaviour of two polymer-blended oils is studied. The irradiated blends have poorer viscosity-temperature characteristics than the unirradiated blends. (2 refs.)
- 76684** Viscosity of a mixture of *n*-butyl and isobutyl alcohols at different temperatures and pressures. R.A.Mustafaev, D.K.Ganiev (Ch. Il'drym Polytech. Inst., Baku, Azerbaidzhan SSR). *J. Eng. Phys. (USA)*, vol.43, no.3, p.1001 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.424-5 (Sept. 1982). The results of an experimental investigation of the dynamic viscosity of binary mixtures of *n*-butyl and isobutyl alcohols are given. In preparing the mixtures the authors paid particular attention to the purity of the components. After drying they were repeatedly distilled under vacuum. Results of chromatographic analysis showed that the purity of the individual substances was 99.9%; the concentration error in the determination of the composition of the mixture was less than 0.1%. (3 refs.)
- 76685** Viscosity behaviour of binary mixtures of non-polar solvents. M.Chauhan, R.Misra, A.Singh, J.P.Shukla, M.C.Saxena (Phys. Dept., Lucknow Univ., Lucknow, India). *Pramana (India)*, vol.20, no.1, p.77-84 (Jan. 1983). [received: May 1983] The viscous nature of binary liquid solutions of non-polar solvents, viz. *n*-heptane, benzene, carbon tetrachloride and paraffin oil has been studied in terms of the deviation from the ideal law. The ideal law is supposed to take the form of (weighted) geometric mean. The viscous behaviour has been observed over a range of temperatures (298-322°K). The relative excess volume and relative excess enthalpy of activation have been evaluated to study the increase in viscosity associated with the shrinkage in mixing of its components. (11 refs.)

66.30 DIFFUSION IN SOLIDS

- 76686** Random walks and correlation factors in diffusion via the vacancy mechanism in hexagonal-close-packed lattices. M.Koiwa, S.Ishioka (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Philos. Mag. A (GB)*, vol.47, no.5, p.767-74 (May 1983). Random walks on hexagonal-close-packed lattices are considered. By decreasing the probability of inter-plane jumps relative to that of intra-plane jumps, random-walk properties exhibit features characteristic of a two-dimensional lattice. For a given set of jump probabilities, the number of distinct lattice points visited in an *n*-step walk $S_n \sim n/\log n$, to a three-dimensional trend, $S_n \sim n$. Correlation factors for self-diffusion via the vacancy mechanism are also calculated exactly for various sets of two-jump frequencies; a previous approximate evaluation by Mullen (1961) is confirmed. (5 refs.)

66.30F Self-diffusion in metals, semimetals, and alloys

- 76687** Investigation of redistribution of the alloying elements during diffusion annealing of titanium alloys. A.A.Popov, L.I.Anisimova, A.L.Vinit'skiy, Yu.P.Denisov, O.G.Lapin (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.749-53 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* Methods of X-ray microspectroscopic analysis and metallography were used to study the diffusion of alloying elements (chromium, aluminium, and molybdenum) during annealing of diffusion pairs composed of an alloy with additives and unalloyed titanium (VT1-0) at temperatures 800-1000°C. The high-temperature distribution of the alloying elements was determined by cooling a sample in water after annealing. It was found that the motion of the phase boundary during annealing at 800-850°C was due to the diffusion of chromium and aluminium, and was not controlled by the boundary processes. The depth of penetration of chromium into the α -phase was practically independent

- of the annealing duration, whereas aluminium became segregated at the interphase boundaries. (6 refs.) *A.T.*

66.30H Self-diffusion and ionic conduction in nonmetals

- 76688** The electrical conductivity of solid and molten cesium hydroxide—a contribution to solid proton conductors. K.-H.Haas (Inst. für Neutronenphys. und Reaktortech., Kernforschungszentrums Karlsruhe, Karlsruhe, Germany), U.Schindewolf. *Ber. Bunsenges. Phys. Chem. (Germany)*, vol.87, no.4, p.346-8 (April 1983). The electrical conductivity of solid cesium hydroxide was by several powers of ten larger, its activation energy by a factor of two to three lower than those of normal solid salts. A steep tenfold increase of the conductivity was observed at the α - β phase transition temperature of solid cesium hydroxide (220°C), above which the OH⁻ ions can rotate freely (rotator phase). A further increase by three powers of ten occurred between 280°C and the melting point (335°C), above which the conductivity was that of a normal molten salt. (23 refs.)
- 76689** Diffusion of cobalt in KCl single crystals. D.Damien, K.V.Reddy (Dept. of Phys., Indian Inst. of Technol., Madras, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.3, p.133-6 (March 1983). Results of the studies on the diffusion of the cobalt in KCl are reported. Annealing was restricted to the temperature range 700-760°C, due to the poor solubility of cobalt. While profiles of crystals annealed for short durations exhibit only one region, long-time annealed samples show up a region of slow diffusion near the surface, in addition to the region of normal diffusion. This anomalous character is explained as due to the poor solubility of CoCl₂²⁻ ions formed in alkali halide lattices. The region of normal diffusion is treated as due to the migration of this complex ion by vacancy mechanism. Values of the activation energy for CoCl₂²⁻ ion diffusion and the enthalpy of migration, obtained from the present study are 1.71 eV and 1.12 eV respectively. (16 refs.)
- 76690** Oxygen self-diffusion in Fe-doped MgO single crystals. K.Ando, Y.Kurokawa, Y.Oishi (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6890-2 (1 June 1983). Oxygen self-diffusion coefficients in Fe-doped MgO single crystals were determined by an isotope exchange technique. The results indicated dopant-insensitive diffusion, which was interpreted as due to the vacancy pair mechanism. (13 refs.)
- 76691** The diffusion of uranium in U₃O₈. D.Glasser Leme, H.J.Matzke (Karlsruhe Establ., European Inst. for Transuranium Elements, Karlsruhe, Germany). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.350-3 (April 1983). The self-diffusion of uranium was measured using U-233 as a tracer. It was found that diffusion in orthorhombic U₃O_{8(-x)} proceeds at rates similar to those in cubic UO_{2.2}. It is thus much faster than U diffusion in UO₂, but not fast enough to explain the observed segregation of metal atoms during the oxidation of (U, Pu)C or (U, Pu)O₂ to MO₂ and M₂O₈ for temperatures below 800°C. Though no enhanced diffusion was observed while reducing U₃O₈ to UO_{2+x}, the mechanical and chemical processes taking place during the oxidation of MO_{2+x} to M₂O₈ might enhance metal atom diffusion. Tracer experiments with the thin layer condition are not suitable to verify this hypothesis because of disintegration of the diffusion specimens into powder under oxidizing conditions. (18 refs.)
- 76692** Ionic conductivity of AlN containing Y₂O₃ or Al₂O₃ at 1173–1773K. M.Yahagi, K.S.Goto (Tokyo Inst. of Technol., Tokyo, Japan). *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.419-25 (1983). In Japanese. The electrical conductivity has been measured at temperatures of 1173K to 1773K on the sintered AlN-Y₂O₃ and AlN-Al₂O₃ systems. The electrical conductivity was independent of nitrogen pressure of 5×10⁻³-10⁻⁵ Pa at 1473K and 1673K. The results on the DC polarization and the EMF of the galvanic cell using AlN as the solid electrolyte are suggesting the predominant ionic conduction. In the experimental temperature range, the specific conductivity can be expressed as follows: for AlN-2 mass%Y₂O₃, $\sigma(\text{S.m}^{-1}) = 1.07(\pm 0.56) \times 10^5 \exp(-E/RT)$, where the activation energy is 169±5 kJ/mol.; AlN-2 mass%Al₂O₃, $\sigma(\text{S.m}^{-1}) = 5.52(\pm 1.67) \times 10^5 \exp(-E/RT)$, where the activation energy is 200±3 kJ/mol. (24 refs.)
- 76693** Interfacial conduction in lithium iodide containing inert oxides. J.B.Phipps, D.H.Whitmore (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA). *J. Power Sources (Switzerland)*, vol.9, no.3-4, p.373-8 (April-May 1983). (International Meeting on Lithium Batteries, Rome, Italy, 27-29 April 1982). Temperature-dependent conductivities are reported for a lithium iodide sample sandwiched between two fused silica plates and for an LiI film deposited on a silica plate. The existence of an Li-SiO₂ interfacial conduction path possessing a conductivity of about 5 ohm⁻¹ at 25°C is confirmed. In addition, an infiltration technique for the preparation of LiI-ceramic particle composites is discussed. (8 refs.)
- 76694** (Ag₂O)_x(Li₂O)_{1-x}2B₂O₃ mixed cation glasses. A.Magistris, G.Chiodelli (Centro di Studio per la Termodinamica ed Elettrochimica, CNR, Pavia, Italy), M.Villa. *J. Power Sources (Switzerland)*, vol.9, no.3-4, p.379-82 (April-May 1983). (International Meeting on Lithium Batteries, Rome, Italy, 27-29 April 1982). An analysis of the ¹¹B NMR spectra in the (Ag₂O)_x(Li₂O)_{1-x}2B₂O₃ glasses shows that the glass network consists of an equal number of BO₂ and BO₃ units and that it does not undergo major changes when a cation is totally or partially substituted by another. The ¹¹B NMR spectra reveal the existence of cation pairs and suggest that Li-Li pairs are more stable than Li-Ag pairs. The ¹¹B spin-lattice relaxation times at 117K display a kind of mixed alkali behavior. These findings suggest that a relationship exists between the increased resistivity of the mixed glasses and the spectra of the low-lying excitations. (7 refs.)

76695 Mechanism of ion conduction in alkali metal-polymer complexes. D.F.Shriver, R.Dupon, M.Stainer (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).

J. Power Sources (Switzerland), vol.9, no.3-4, p.383-8 (April-May 1983). (International Meeting on Lithium Batteries, Rome, Italy, 27-29 April 1982). Polymer electrolytes have many materials properties which are attractive for applications in advanced electrochemical devices. However the ionic conductivities are still too low for widespread utilization. One avenue for the improvement of the conductivity is the delineation of the factors which influence ion transport in polymers. The most successful models for alkali metal ion transport in polymers are based on the concept that ions are passed between polymer segments by large amplitude polymer motions, and that relatively few interactions between the ion and polar polymer groups are broken in the transition state. Evidence for the contribution of polymer segmental motion to ion transport is obtained from the form of the temperature-dependent conductivity, from the higher conductivity for amorphous than for crystalline polymers, from the decrease in conductivity with increasing pressure, and from doping experiments. Simple energy estimates indicate that the ion motion probably occurs with the breaking of at most one or two cation-polar group interactions, rather than the hop of an ion from one polymer chain to the next. (19 refs.)

76696 Mechanism of high ionic conductivity in elastomeric networks. H.Cheradame, A.Gandini, A.Killis, J.F.Le Nest (Lab. de Chimie des Polymères, Ecole Française de Papeterie, St. Martin d'Hères, France). *J. Power Sources (Switzerland)*, vol.9, no.3-4, p.389-95 (April-May 1983). (International Meeting on Lithium Batteries, Rome, Italy, 27-29 April 1982). The viscoelastic properties and the ionic conductivity of polyether-polyurethane networks containing alkali metal salts have been studied at various temperatures, salt concentrations and network structures. The reduced temperature, $T-T_g$, is the predominant parameter which governs the viscoelastic behaviour and the ionic conductivity of these networks. Using the free volume concept an expression is derived for the ionic conductivity, irrespective of the macrostructure involved. The logarithm of the reduced conductivity, σ_r/σ_{TR} (which is the ratio of the conductivity at a given temperature to that at the reference temperature), is a linear function of the shift factor, $\log a_T$, given by the dynamic mechanical properties. A comparison is made between the WLF parameters C_1 and C_2 , obtained from conductivity and viscoelastic measurements. (13 refs.)

76697 Ionic conductivity of BaFCl. K.Somaiah (Dept. of Phys., Post-Graduate Coll. of Sci., Osmania Univ., Saifabad, Hyderabad, India), V.Hari Babu.

Phys. Status Solidi b (Germany), vol.117, no.1, p.75-9 (1 May 1983). The ionic conductivity of undoped and doped BaFCl, single crystals is measured. In BaFCl, the measurements are performed parallel and perpendicular to the crystallographic c -axis. Incorporation of monovalent impurities (Tl, Na) enhances the conductivity while it decreases by doping with trivalent impurities (Gd). The results indicate that BaFCl exhibits anionic conduction via halide ion vacancies and that the thermally generated lattice defects are of Schottky type. The probable mechanism for the conduction process in these crystals is discussed on the basis of structural considerations of the unit cell. (9 refs.)

76698 Computer simulation of the correlation factors in vacancy-pair diffusion in NaCl-type lattices. R.-L.Lindstrom, R.Lindstrom (Dept. of Math. & Phys., Univ. of Joensuu, Joensuu, Finland).

Philos. Mag. A (GB), vol.47, no.5, p.627-33 (May 1983). Monte Carlo methods have been used to calculate the correlation factors of ions and vacancies when the diffusion proceeds via a bound vacancy-pair mechanism in NaCl-type lattices. The estimator proposed to Stolwijk and Bakker (1977) and the authors' moment estimator both give slightly smaller correlation factors for the ions in comparison to those deduced analytically. However, the correlation factors of the vacancies are in good agreement with theory. (10 refs.)

76699 Proton conductivity of a hydrogen bond chain in a strong electric field. P.M.Tomchuk, V.V.Krasnogolovets, N.A.Protsenko. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.767-74 (May 1983). In Russian. Proton conductivity of a hydrogen bond chain is considered in a small-radius polaron model. An expression is given for the density of a space-charge limited current caused by the proton polaron (proton holes) transport. The criterion for the jumping mechanism regime is given. (23 refs.)

76700 Kinetics and mechanism of hydrogen diffusion in hydrides of titanium, zirconium and TiNi_3 . E.Brauer, R.Gruener (Inst. für Phys. Chem., Univ. Frankfurt, Frankfurt/Main, Germany), F.Rauch. *Ber. Bunsenges. Phys. Chem. (Germany)*, vol.87, no.4, p.341-5 (April 1983). Hydrides of titanium and zirconium formed during cathodic polarization in acid solutions were investigated by the ^{15}N nuclear reaction method. Hydrogen depth profiles obtained in this way give informations about the hydrogen concentration in the metal, allowing to determine diffusion coefficients and to study the absorption of hydrogen by the metal lattice and the kinetics of the hydride layer growth. The mechanism was studied using Ti single crystals. The hydrogen diffusion was found to depend on the crystal orientation. (19 refs.)

76701 Diffusivity and permeability of hydrogen in neutron irradiated molybdenum and platinum. H.Katsuta, T.Iwai, H.Ohno (Molten Materials Lab., JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.206-10 (April 1983). Hydrogen permeability and diffusivity were measured in neutron irradiated (3.0×10^{15} or 1.2×10^{16} n/cm²) metals of pure molybdenum of BCC structure and platinum of FCC. Although hydrogen permeability in molybdenum was decreased by 10% to 20% by the irradiation, in platinum it was increased by about 10%. X-ray diffraction analysis of the irradiated metals was also performed to study the relation between hydrogen behaviour in the metals and its neutron irradiated structures. (12 refs.)

76702 Reversible isopentane-induced depression of carbon dioxide permeation through polycarbonate. R.T.Chern, W.J.Koros, H.B.Hopfenberg, V.T.Stannett (Dept. of Chem. Engng., North Carolina State Univ., Raleigh, NC, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.753-63 (May 1983). Permeability data are reported for carbon dioxide in Lexan polycarbonate at 35°C. Measurements were made for both pure carbon dioxide and for a mixed feed consisting of carbon dioxide with a 117.8-torr (0.155-atm) partial pressure of isopentane. The effects of varying upstream CO_2 driving pressure from 1 up to 20 atm were studied. The permeability to CO_2 is reduced significantly in the presence of isopentane; however, the fractional depression of the CO_2 permeability due to the isopentane at low driving pressures is much more significant than at high CO_2 driving pressures. The well-known pressure dependence of carbon dioxide permeabilities in glassy polymers, therefore, is largely diminished by introducing isopentane to the pure carbon dioxide feed. These observations are consistent with a model for transport in glassy polymers which explains the observed trends in terms of competition between the two penetrants for microvoid sorption sites existing in the nonequilibrium glassy polymer. (13 refs.)

76703 Concentration dependence of the boron diffusion coefficient in silicon. Dao Khac An, Le Hoang Mai, Pham Hoi (Dept. of Phys. & Technol. of Semiconductor Devices, Inst. of Phys., Hanoi, Vietnam).

Phys. Status Solidi a (Germany), vol.76, no.1, p.K85-8 (16 March 1983). Describes some experimental results of boron diffusion in silicon using boron nitride and BBr_3 liquid sources in the temperature range 900 to 1050°C in nitrogen ambient. Profiles of boron impurities were obtained from the differential resistivity technique. The diffusion coefficient versus impurity concentration was determined by the Boltzmann-Mantano analysis method. (10 refs.)

76704 Co tracer diffusion in Al. G.M.Hood, R.J.Schultz, J.Armstrong (Chalk River Nuclear Lab., AECL, Chalk River, Ontario, Canada).

Philos. Mag. A (GB), vol.47, no.5, p.775-9 (May 1983). Measurements of ^{60}Co diffusion in Al single crystals have been made at 930-, 913, 804 and 724K. The results support previous work on this system by Peterson and Rothman (1970). Analysis of the combined results yields the equation $D = 5.06 \times 10^{-2} \exp(-1.82 \text{ eV}/k_B T) \text{ m}^2 \text{ s}^{-1}$. (6 refs.)

76705 Diffusion of iron in aluminum studied by Mossbauer spectroscopy. S.Mantl (Inst. für Festkörperforschung, Kernforschungsanlage Jülich GmbH, Jülich, Germany), W.Petry, K.Schroeder, G.Vogl.

Phys. Rev. B (USA), vol.27, no.9, p.5313-31 (1 May 1983). The broadening of the ^{57}Fe Mossbauer line due to diffusion jumps of the Fe atoms in an Al single crystal has been measured as a function of crystal orientation. The broadening is strongly anisotropic. Theoretical calculations for the broadening using the five-frequency model for the motion of an Fe atom via vacancies show that the following information about the geometry and perturbed jump frequencies of the Fe-vacancy complex can be obtained: (i) The anisotropy of the broadening yields information about the jump geometry and jump-frequency ratios, (ii) the absolute value and the temperature dependence of the broadening yield the diffusion coefficient and the activation energy for Fe diffusion, and (iii) the anomalous decrease of the Mossbauer intensity in the vicinity of the melting point yields information about the binding energy of the Fe-vacancy complex. The results are consistent with the following interpretation: Fe in Al moves by exchanging sites with nearest-neighbor vacancies. The binding energy of an Fe-vacancy complex is $E_b = 0.29 \text{ eV}$. The diffusion coefficient of Fe in Al is $D_{Fe} = 1.1 \times 10^{14} \exp[-(2.3 \pm 0.2 \text{ eV})/k_B T] \text{ cm}^2 \text{ s}^{-1}$ in reasonable agreement with results from tracer experiments. Values are obtained for different jump frequencies of a vacancy in the vicinity of an Fe atom. (61 refs.)

76706 Method approach to investigating the high-temperature hydrogen permeability of metals. V.I.Pokhmurskiy, I.I.Sidorak, R.G.Parkheta (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.363-6 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.81-5 (July-Aug. 1982). [received May 1983]

Presents the basic principles of a method approach to conducting investigations of high-temperature hydrogen permeability of metals. The use of these principles would make it possible to critically evaluate the published results obtained, would provide the possibility of correct comparison and appropriate analysis of them, and also would ease their theoretical and practical use. (15 refs.)

76707 The concentrated profile of photostimulated Ag diffusion in thin As_2S_3 layers. M.T.Kostyshyn, O.P.Kasyarum, A.A.Kudryavtsev.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.710-13 (May 1983). In Russian. The influence of Ag-doping degree in the interface region of As_2S_3 on the kinetics of Ag photostimulated diffusion (PSD) into thin As_2S_3 layers is investigated in a two-layer semiconductor-metal structure. It is discovered that an increase of the PSD rate at the initial stage is related to formation of a particular Ag-doped semiconductor region at the As_2S_3 -Ag interface. The initial stage of Ag PSD is completed when the depth of such region reaches about 11.6 nm. The spread of the Ag-doped region onto the whole semiconductor volume takes place at the stationary Ag-concentration behind the diffusion front (about 80% from the maximum concentration which may be reached by the PSD-method in such a semiconductor). (4 refs.)

76708 The Cd-diffusion in InP. W.Kuebart, O.Hildebrand, H.W.Marten (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany), N.Arnold. Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.597-604. Cd diffusion profiles in InP have been measured using a BPO profile plotter. These profiles are explained with a new, local equilibrium diffusion theory: the diffusing Cd atoms appear as singly and doubly ionized acceptors, the latter one having a considerably higher diffusion coefficient. With a new EBIC theory and from the correlation between EBIC and etching lines, the authors can explain the observed EBIC linescans and the origin of the etch lines. (8 refs.)

66.30N Chemical interdiffusion

76710 The effect of interposed silicide thickness on growth rate in bilayer silicide thin-film structures: the Si(111)/Pd₂Si/Cr system. E.C.Zingu (Dept. of Phys., Univ. of the Western Cape, Bellville, S Africa), C.Comrie, R.Pretorius. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2392-401 (May 1983). A model has been developed, using Fick's diffusion equations, to describe the effect of interposed silicide thickness on the growth rate of the outer silicide layer in bilayer metal-silicon thin film system. The model is based on diffusion-limited transport of silicon through the interposed silicide layer and predicts that the growth rate of the outer silicide layer will be inversely proportional to the thickness of the interposed layer, if the interposed thickness exceeds a certain critical value. To test the model, the growth rate of CrSi₂ formation in the Si(111)/Pd₂Si/Cr system was studied as a function of Pd₂Si thickness. The CrSi₂ thickness was always found to increase linearly with annealing time, indicating a reaction-limited process. For thin epitaxial Pd₂Si layers the CrSi₂ growth rate was equal to that of CrSi₂ grown directly on Si. However, for epitaxial Pd₂Si layers thicker than the critical thickness, CrSi₂ growth was inhibited causing the growth rate to be inversely proportional to Pd₂Si thickness, in contrast to that found for CrSi₂ formation on nonepitaxial Pd₂Si where no thickness effects were found. The thickness effect of the epitaxial Pd₂Si layer is believed to be due to its microstructure, which inhibits silicon diffusion. (12 refs.)

76711 Ti-W alloy interaction with silicon in the presence of PtSi. F.Nava, C.Nobili (Istituto di Fisica, Univ. di Modena, Modena, Italy), G.Ferla, G.Iannuzzi, G.Queirolo, G.Celotti. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2434-40 (May 1983). Ti-W alloy film was deposited by conventional DC sputtering on a PtSi film grown on a (100) silicon substrate. Two sets of samples were prepared with different oxygen content in the Ti-W film. MeV "He" backscattering analysis shows, after vacuum annealing, the formation of a ternary mixture (Ti_{1-x}W_x)Si₂(x=0.24). The Ti:W ratio in the mixture is the same as in the as-deposited film. The growth in the 625-775°C temperature range is directly proportional to the time and the process is thermally activated with an activation energy of 3.3±0.1 eV. During the thermal annealing the platinum silicide is always located between the ternary mixture and the Si substrate. X-ray diffraction indicates the formation of a pseudobinary solid solution with an hexagonal structure with a=4.61±0.01 Å and c=6.47±0.02 Å. The presence of the oxygen slows down the reaction but does not change the mechanism of the compound formation. The content and distribution of impurities was measured using Auger technique combined with Ar sputtering. In the two sets of samples the average oxygen concentration is 1% and about 5%, respectively. The oxygen is mainly located at the Ti-W/PtSi interface. During the compound formation the oxygen distribution is not modified. (28 refs.)

Electrical characteristics of thin Ni₂Si, and NiSi₂ layers grown on siliconSee Entry 77071

66.30Q Electromigration

76712 Effects of annealing and electromigration on surface morphology of polycrystalline films. Chi-Yang Chang (Kaoshiung Inst. of Technol., Kaoshiung, Taiwan), Huei-Li Huang. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2287-94 (May 1983). The capillary-induced surface mass transport has been extended to cases where there is a notch and/or a ridge on a bicrystal system. Changes in the surface morphology caused by capillary-induced and electromigration-induced surface diffusions and grain boundary diffusions have been analyzed. Thermal grooving is shown to develop only when the initial slope of a notch on the crystal surface is less than γ_b/2γ_s(γ_b and γ_s are, respectively, the grain boundary and the surface Gibbs free energy) or when the initial surface contains a ridge at the grain boundary. The slope of the grooving profile is invariant with time but its depth develops as the one fourth power of time. Surface fluxes due to the electromigration origin change the morphology in an asymmetric manner, biased in the direction of the electron flow. When combined with fluxes from grain boundary diffusion, severe mass depletion and accumulation can occur, giving rise to characteristic electromigration damage of open circuit failures. Finally, the concept of an optimum annealing time in relation to electromigration is explored. (23 refs.)

76713 New insights on the reversal of the site of electromigration failure in gold films doped with alkali. R.E.Hummel, S.Matts-Goho, R.T.DeHoff (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2855-6 (May 1983). The description of current-induced failures in thin film metallizations used in microelectronic devices should not be limited to electron wind arguments. Several failure mechanisms such as grain boundary grooving, thermotransport and electrotransport, may contribute to matter transport under conditions normally encountered in service. Grain boundary grooving is accelerated by

doping thin gold films with alkali ions. Pure thin gold stripes which are subjected to a direct current of high density fail near the cathode, whereas similar gold films doped with alkali ions fail near the anode. Experiments utilizing Auger electron spectroscopy show an enrichment of alkali metal near the anode after current stressing. The accumulation of alkali metal at the anode promotes grain boundary grooving and void formation there. (17 refs.)

76714 Temperature-ramp resistance analysis to characterize electromigration [of IC conductors]. R.W.Pasco, J.A.Schwarz (Dept. of Chem. Engng. & Materials Sci., Syracuse Univ., Syracuse, NY, USA). *Solid-State Electron. (GB)*, vol.26, no.5, p.445-52 (May 1983). A temperature-ramp technique is presented that enables determination of the kinetic parameters for electromigration processes. With this method, pre-exponentials and activation energies can be measured in a single experiment requiring a few hours. The technique is applicable to both practical and fundamental studies of electromigration. For example, in terms of the former, reliability factors for conductor lifetimes can be readily determined. As far as the latter, new conductor compositions can be rapidly screened to ascertain their electromigration behavior. To demonstrate the application of the method, Temperature-ramp Resistance Analysis to Characterize Electromigration (TRACE) has been applied to thin-film aluminum conductors. Results have yielded activation energies in agreement with literature values. Furthermore, TRACE results have been used, along with resistivity results from the literature, to determine the current density effect on the pre-exponential factor. The value of the current density exponent thus determined is in accord with the range reported in the literature for Mean Time to Failure (MTF) experiments. (18 refs.)

66.60 THERMAL CONDUCTION IN NONMETALLIC LIQUIDS

[for thermal conduction in liquid metals, see 72.15C]

76715 Theory of thermal waves. V.A.Bubnov (Moscow Machine-Tool Inst., Moscow, USSR). *J. Eng. Phys. (USA)*, vol.43, no.3, p.1006-12 (Sept. 1982). Translation of: *Inzh.-Fiz. Zh. (USSR)*, vol.43, no.3, p.431-8 (Sept. 1982). An analogy between thermal and electromagnetic waves is established. The conditions under which thermal oscillations can give rise to acoustical oscillations are derived. The coefficients of thermal conductivity in liquid helium are calculated as a function of the temperature below the lambda point. (13 refs.)

66.70 NONELECTRONIC THERMAL CONDUCTION AND HEAT-PULSE PROPAGATION IN NONMETALLIC SOLIDS

[for thermal conduction in solid metals, see 72.15C and 72.15E; for statistical mechanics of lattice vibrations, see 63.70]

76716 Phonon lifetime and thermal conductivity in amorphous solids. K.Handrich (Sektion Phys., Tech. Hochschule Leuna-Merseburg, Merseburg, Germany). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.533-8 (1 April 1983). After a short discussion of the static structure factor S(k) in the small angle region and the low-temperature thermal conductivity K(T) of amorphous solids, a perturbation theory is developed, which yields the phonon lifetime τ_k and the thermal conductivity K of a weakly and randomly inhomogeneous solid. It is shown that the strong increase of S(k) for k≤10⁻² Å⁻¹ leads to τ_k~k and K~T² for T≤1 K. From S(k)≈const. for k≥10⁻² Å⁻¹ it follows that τ_k~k⁴ (Rayleigh scattering). Thus phonons with wave vectors k≥10⁻² Å⁻¹ will be strongly scattered and will not contribute to the thermal conductivity. This is the reason for the plateau of K for T≥1 K. (15 refs.)

76717 Thermal conductivity of amorphous silicon. H.J.Goldsmid, M.M.Kaila, G.L.Paul (School of Phys., Univ. of New South Wales, Kensington, NSW, Australia). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K31-3 (16 March 1983). The authors have recently developed a new steady state method for the measurement of the thermal conductivity of thin layers of poorly conducting materials. Here they describe the technique and report its application to the determination of the thermal conductivity of amorphous silicon. (1 ref.)

76718 Theory of heat conduction in solids. L.P.Bulat, V.G.Yatsyuk (Lvov Polytech. Inst., Ternopol, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1994-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3499-501 (Nov. 1982). [received: May 1983]

The authors study the influence of the temperature dependence of the thermal conductivity on the temperatures of quasiparticle subsystems participating in heat transport. They are interested mainly in internal (bulk) effects in fairly large samples. They consider the specific case of an isotropic technologically homogeneous semiconductor containing one type of carrier (electrons). It is assumed that the electron (T_e) and lattice (T_l) temperatures can be introduced independently. They ignore the influence of the electron-phonon drag on heat conduction, and carry out an analysis in the one-dimensional geometry of heat conduction across an infinite layer. (5 refs.)

66.90 OTHER TOPICS IN NONELECTRONIC TRANSPORT PROPERTIES

76719 Study and application of the mass transport phenomenon in InP. T.R.Chen, L.C.Chiu, A.Hasson, K.L.Yu, U.Koren, S.Margalit, A.Yariv (California Inst. of Technol., Pasadena, CA, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2407-12 (May 1983). A study of the mass transport phenomenon in InP is presented. Conditions and possible explanation for the transport process are discussed. Characteristics of the mass transported InP homojunctions are described and compared with those in the InP-InGaAsP heterojunctions. Effects of the mass transported junction on laser performance are discussed. (8 refs.)

67.00 QUANTUM FLUIDS AND SOLIDS; LIQUID AND SOLID HELIUM

(see also 05.30 Quantum statistical mechanics)

67.20 QUANTUM EFFECTS ON THE STRUCTURE AND DYNAMICS OF NONDEGENERATE FLUIDS

76720 Low temperature expansions for the second and third cluster integrals of a two dimensional quantum system of hard discs. W.G.Gibson (Lab. de Phys. Theorique et Hautes Energies, Univ. de Paris Sud, Orsay, France). *Mol. Phys. (GB)*, vol.49, no.1, p.103-28 (May 1983). Low temperature series are derived for the second and third cluster integrals of a quantum mechanical, two dimensional gas of hard discs. The methods used are similar to those previously employed for the three dimensional, hard sphere gas, but the presence of logarithmic terms makes both the derivations and the results more complicated in the present case. The corresponding contributions to the density expansion of the specific heat are calculated. The three body contribution is large and negative, thus leading to a downturn in the specific heat at low temperature, in accordance with a prediction of Siddon and Schick (1974). (31 refs.)

67.40 BOSON DEGENERACY AND SUPERFLUIDITY OF HELIUM-4

76721 Interacting bosons and properties of liquid ^4He II. K.M.Khanna, S.Chaubha Singh (Dept. of Materials Sci., Nat. Inst. of Foundry & Forge Technol., Ranchi, India), O.P.Sinha. *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.97-102 (Feb. 1983). Properties of interacting bosons have been studied using the Hamiltonian written in terms of the density fluctuation operator ρ_k and the velocity operator v_k . Calculations carried out for the excitation spectrum, structure factor and velocity of sound for a dilute system of bosons using Gaussian potential and Lennard-Jones potential show a marked agreement with the corresponding values obtained experimentally for liquid ^4He for only some definite values of wave number k only. The calculations show that if the transition temperature is large, the depletion is small and vice versa. (12 refs.)

76722 Sound conversion phenomena at the free surface of liquid helium. II. Experimental determination of acoustic coefficients and surface absorption coefficients. H.Wiechert, F.I.Buchholz (Inst. für Phys., Johannes-Gutenberg Univ., Mainz, Mainz, Germany). *J. Low Temp. Phys. (USA)*, vol.51, no.3-4, p.291-318 (May 1983). For pt.I see *ibid.*, vol.39, p.623 (1980). The acoustic coefficients of reflection, transmission, and transformation of first-, second-, and gas sound waves incident normally on the free surface of liquid helium have been determined. It is shown that equilibrium theories of boundary conditions disagree with the experiments. Nonequilibrium theories, however, which take into account that mass and energy transport processes occur at the liquid-vapor interface of helium II, lead to a very good description of the experimental data below 2K. Within experimental accuracy the measurements fully confirm several kinetic models of evaporation and energy transport processes. Near the λ point, deviations from the theory have been found which might be attributed to influences of critical phenomena. The surface absorption coefficients of first-, second-, and gas sound waves could be deduced from the experimental data on the acoustic coefficients, and it is shown that, in agreement with the theory, appreciable energy dissipation occurs at the free surface of helium II when a second-sound or a gas sound wave is incident. (55 refs.)

76723 Measurements of the Kapitza resistance and Onsager cross-coefficient for the ^4He crystal-superfluid interface. P.E.Wolf, D.O.Edwards, S.Balibar (Groupe de Phys. des Solides, Ecole Normale Supérieure, Paris, France). *J. Low Temp. Phys. (USA)*, vol.51, no.5-6, p.489-504 (June 1983). The effect of a heat current across the atomically rough crystal-superfluid interface in ^4He has been studied below 1K. The chemical potential difference $\Delta\mu$ and temperature difference ΔT were measured simultaneously, the ΔT by means of a 'superfluid melting-curve thermometer'. The results give the mean phonon transmission coefficient across the interface $\bar{\tau}$ and a dimensionless quantity β that determines the Onsager coefficient linking $\Delta\mu$ with the heat current. The transmission probability $\bar{\tau}$ is proportional to T^2 below 0.2K, in agreement with other experiments and with various theories, and it depends slightly on the crystal orientation, increasing near the c axis. The coefficient β , which is roughly independent of temperature and orientation, agrees with a recent theory of Bowley and Edwards. (20 refs.)

76724 Mutual friction and vortex motion near the superfluid transition. A.Onuki (Dept. of Phys., Kyushu Univ., Fukuoka, Japan). *J. Low Temp. Phys. (USA)*, vol.51, no.5-6, p.601-32 (June 1983). The mutual friction parameters B and B' for a moving vortex are calculated near the superfluid transition. They are proportional to the kinetic coefficient associated with the order parameter and, as $T \rightarrow T_\lambda$, diverge as $(T_\lambda - T)^{-1/3}$, in agreement with experiment. The nonlinear couplings between the order parameter ψ and the entropy m , both the reversible one and the one in the free energy, are found to be crucial in the mutual friction near the λ point. First, the reversible coupling in the dynamic equations makes the chemical potential deviation long-ranged and causes the dissipation to take place only near the vortex core. Second, B' can diverge as $T \rightarrow T_\lambda$ only in the presence of the coupling of the form $m|\psi|^2$ in the free energy. Thus the E model of Halperin et al. (1976) where the latter coupling is absent cannot explain the critical anomaly of B' . The helical mode of a single vortex line is also investigated and its dispersion relation is found to be quite different from that at

low temperatures. This mode has the same time scale as that of the second-sound mode when the wave vectors are of the order of the inverse correlation length, thus obeying the usual dynamic scaling law. The time correlation functions of the displacement fluctuations of a vortex line are also obtained. The force acting on a moving vortex is calculated and is found to be equal to the classical Magnus force. (48 refs.)

76725 Variational approach to dynamics of interfaces and quantized vortex lines. K.Kawasaki (Dept. of Phys., Kyushu Univ., Fukuoka, Japan). *Physica A (Netherlands)*, vol.119A, no.1-2, p.17-40 (April 1983). A variational formulation is presented for deriving equations of motion of topological singularities of stochastic nonlinear field equations which permits a clear separation of static and kinetic interactions that enter the problem. The method is used to obtain stochastic equations of motion of interfaces of binary critical fluids and also of quantized vortex lines of superfluid Helium with thermal noise. (19 refs.)

76726 Calculations of ground-state properties of liquid ^4He droplets. V.R.Pandharipande (Univ. of Illinois, Urbana, IL, USA), J.G.Zabolitzky, S.C.Pieper, R.B.Wiringa, U.Helmreich. *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1676-9 (23 May 1983). Quantum mechanical calculations of the ground states of droplets of N atoms of ^4He are reported. The calculations have been made by the variational Monte Carlo method for $3 \leq N \leq 728$ and by the Green's function Monte Carlo method for $3 \leq N \leq 112$. The energies, RMS radii, and density distributions are reported; liquid-drop fits to the energies and radii are discussed. (10 refs.)

76727 Damping of second sound in superfluid helium near T_λ . M.J.Crooks, B.J.Robinson (Dept. of Phys., Univ. of British Columbia, Vancouver, British Columbia, Canada). *Phys. Rev. B (USA)*, vol.27, no.9, p.5433-9 (1 May 1983). The damping coefficient of second sound has been measured in liquid helium at saturated vapor pressure near T_λ . The results cover the temperature range $40 \text{ mK} > T - T_\lambda > 40 \text{ } \mu\text{K}$, and were obtained by the measurement of decay rates in a high- Q second-sound resonant cavity. These values are in good agreement with the predictions of nonlinear renormalization-group analysis applied to the asymmetric planar spin model for liquid helium in the 'crossover' and precritical temperature ranges. (26 refs.)

76728 Experimental study of the flow of liquid ^4He through very small channels: Finite-size effects near T_λ . N.Giordano (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5447-59 (1 May 1983). The flow of liquid ^4He through the very small cylindrical channels present in Nucleopore filters has been studied. Filters with channel diameters in the range 100-3300 Å have been utilized, with emphasis on the behavior in the vicinity of the superfluid transition. As observed by many previous workers, the author finds that the onset of superfluid flow of the ^4He in the channels occurs at a temperature, $T_{\lambda c}$, which is below the transition temperature of bulk ^4He . The results for the variation of $T_{\lambda c}$ with channel size are in good quantitative agreement with the current theory. (47 refs.)

76729 Atomic impurities in liquid helium. K.E.Kurten (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA), M.L.Ristig. *Phys. Rev. B (USA)*, vol.27, no.9, p.5479-85 (1 May 1983). Paired-phonon analysis is employed to determine the optimal ground-state wave function of Jastrow type for a binary boson mixture. The formalism is specialized and applied for studying the behavior of ^3He , ^4He , and Cs impurities in liquid ^4He at saturation density. The authors present numerical results on chemical potentials, volume coefficients, and related quantities and discuss the properties of the optimal radial distribution functions and static structure functions characterizing the atomic impurities. (25 refs.)

76730 Experimental study of the Kosterlitz-Thouless transition in ^4He films. J.Maps, R.B.Hallock (Dept. of Phys. & Astron., Univ. of Massachusetts, Amherst, MA, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5491-507 (1 May 1983). Measurements of the effective thermal conductance of a ^4He film on a Mylar substrate are reported in the vicinity of the transition to superfluid behavior. Experiments have been conducted as a function of film thickness and are consistent with the expected exponential behavior of the free vortex number density as the transition is approached from the normal-fluid side. On the superfluid side of the transition the effective conductance is observed to be a power law in the applied thermal power. The connection between the exponent of the power law and the superfluid density is examined. The experiments reveal an apparent upper limit to the number density of velocity-induced free vortices. Preliminary results for ^3He - ^4He mixtures are reported as are nonlinear effects in the ^4He -vapor conductance. (42 refs.)

76731 Spatial structure changes in ^4He at fixed density as a function of temperature. F.W.Wirth, D.A.Ewen, R.B.Hallock (Dept. of Phys. & Astron., Univ. of Massachusetts, Amherst, MA, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5848-51 (1 May 1983). X-ray scattering techniques have been used to determine changes in spatial order when cooling ^4He below T_λ at several fixed values of the density. The results show surprisingly little density dependence and are relevant to the discussion of condensate fraction determinations in ^4He . (20 refs.)

76732 Sound velocity in helium-filled porous Vycor glass. J.R.Beamish, A.Hikata, C.Elbaum (Metals Res. Lab., Brown Univ., Providence, RI, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5848-51 (1 May 1983). The velocity of longitudinal and transverse sound in helium-filled porous Vycor glass was measured and analyzed with the use of the Biot theory of sound propagation in fluid-filled porous media. From transverse wave velocities, the superfluid fraction was determined and, from longitudinal velocities, the elastic properties of the helium were determined. (10 refs.)

Theory of thermal waves See Entry 76715

67.50 FERMION FLUIDS; LIQUID HELIUM-3

76733 Spectroscopy with sound on superfluid ^3He B. D.M.Lee (Lab. of Atomic & Solid State Phys., Cornell Univ., Ithaca, NY, USA). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1191-9 (April 1983). Collective modes of superfluid ^3He β have been studied by means of sound attenuation and sound velocity studies. A new sound attenuation peak has been observed in superfluid ^3He B at $\hbar\omega \approx \Delta(T)$. This peak has been identified with the real squashing mode. Pulse time of flight methods has been used in these studies. At high sound amplitudes, interesting transient effects have been observed which have been tentatively identified with solitonlike behavior. (18 refs.)

76734 History-dependent nonlinear dissipation in superfluid $^3\text{He-A}$. R.Gay, M.Bagley, J.R.Hook, D.J.Sandford, H.E.Hall (Phys. Dept., Univ. of Manchester, Manchester, England).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.227-48 (May 1983). The authors have studied nonlinear dissipation in oscillatory flow of $^3\text{He-A}$ through 49- μm and 17- μm -wide channels by means of torsion pendulum experiments at about 50 Hz. The observed effects are strongly history dependent; the dissipation at a given measuring amplitude is strongly increased if the sample is cooled through T_c while oscillating at large amplitude. Once a highly dissipative state has been created it does not noticeably decay below T_c , though a more dissipative state can be created below T_c by a period of sufficiently large-amplitude oscillation. The results are described semiquantitatively by a model based on the idea of superflow collapse by motion of the \vec{l} vector, with consequent orbital dissipation. This history dependence is introduced into this model by postulating the existence of surface singularities in the \vec{l} texture, the density of which is determined by the previous history of the helium. (16 refs.)

76735 Ground state of $^3\text{He-A}$ in a sphere. P.Hirschfeld, D.L.Stein (Joseph Henry Labs. of Phys., Princeton Univ., Princeton, NJ, USA).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.257-63 (May 1983). The authors compare the free energies and currents of four trial states of $^3\text{He-A}$ in spherical geometries. The spherical boojum texture is found to be energetically stable for all container radii down to $R \sim 46\xi$, where ξ is the superfluid coherence length. Textures with line defects in the bulk become energetically favorable below this radius. (7 refs.)

76736 Spin diffusion and spin echo in normal liquid ^3He . A.Pal, P.Bhat-tacharyya (Tata Inst. of Fundamental Res., Bombay, India).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.265-78 (May 1983). The problem of spin diffusion in normal liquid ^3He in the presence of precessional effects is reexamined taking into account the energy dependence of the quasiparticle relaxation time. This leads to a generalization of Leggett's relation (1970) for the successive height of the echoes in a ϕ -180°-180° experiment. Reanalyzing the experiment of Corricini et al. (1972) (including finite-temperature corrections) leads to almost exact and model-independent values of F_1^a and λ_D . (19 refs.)

76737 Evidence for nonsingular vorticity in the Helsinki experiments on rotating $^3\text{He-A}$. N.K.Seppala, G.E.Volovik (Low Temperature Lab., Helsinki Univ. of Technol., Espoo, Finland).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.279-90 (May 1983). A theory for the satellite peak in the NMR spectrum of rotating superfluid $^3\text{He-A}$ is presented. Absorption at the frequency of the satellite is produced by spin waves localized on vortex lines. The peak frequency and total intensity of the satellite are calculated for both singular and nonsingular vortices; a comparison with the Helsinki NMR data strongly suggests that nonsingular vorticity was actually observed in the experiments. (15 refs.)

76738 Quasiparticle scattering amplitude for normal liquid ^3He . M.Pfützner, P.Wolfe (Phys. Dept., Tech. Univ. München, Garching, Germany).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.535-59 (June 1983). The quasiparticle scattering amplitude is calculated from a semimicroscopic model by analytically solving a generalization of Landau's integral equation to momentum transfers up to $2p_F$. This solution in general does not obey exchange symmetry for a given particle-hole irreducible vertex part $f_{pp}(q)$. The authors establish conditions for and explicitly construct exchange-symmetric scattering amplitudes by adding higher angular momentum components. Results using certain models for $f_{pp}(q)$ are compared with transport properties of liquid ^3He . (34 refs.)

76739 Superfluidic ^3He . II. D.Vollhardt (Max-Planck-Inst. für Phys. und Astrophys., München, Germany).

Phys. Bl. (Germany), vol.39, no.5, p.120-4 (May 1983). In German. For pt.1 see *ibid.*, vol.39, p.41-5 (1983). This is the second of a series of three papers dealing with liquid ^3He where Cooper Pairs are generated at a temperature of 2.6 K. A Bose-Einstein system is postulated for quantum coherence and the effects of container walls and magnetic field are briefly discussed. Mass flows are calculated in the anisotropic fluid and, finally, superconductivity stability is examined, allowing for spin-path coupling. (20 refs.) *G.M.E.*

76740 Hydrodynamic sound experiments in normal and superfluid ^3He . G.Eska, K.Neumaier, W.Schoepe, K.Uhlir, W.Wiedemann (Zentralinst. für Tieftemperaturforschung, Garching, Germany).

Phys. Rev. B (USA), vol.27, no.9, p.5534-48 (1 May 1983). In a cylindrical resonator the attenuation and the velocity of first sound in normal and superfluid ^3He have been measured in the frequency range from 40 to 300 kHz and at pressures of 8, 18.8, and 28 bar. In the normal fluid the viscosity deduced from the authors' data agrees with previously reported values; the sound velocity in this regime can be explained by taking into account mean-free-path effects and zero-sound corrections. The results for the viscosity in the superfluid confirm the previous observations of a continuous decrease down to the lowest temperatures in contradiction to theoretical predictions. The sound-velocity data in the superfluid regime indicate that specular reflection of the quasiparticles may occur at the resonator walls. (37 refs.)

67.60 MIXED SYSTEMS; LIQUID HELIUM 3-4 MIXTURES

76741 Neutron scattering from liquid mixtures of ^3He and ^4He . K.S.Pedersen, R.A.Cowley (Dept. of Phys., Univ. of Edinburgh, Edinburgh, England).

J. Phys. C (GB), vol.16, no.14, p.2671-8 (20 May 1983). Calculations have been made of the dynamic structure factor $S(Q, \omega)$ of liquid mixtures of 6%, 12%, 25%, 50% and 75% of ^3He in ^4He using a polarisation potential theory. The resulting spectra contain two principal features: ^4He phonon-rotor excitations and ^3He quasiparticle-quasihole excitations. It is not however possible to describe the scattering quantitatively without taking account of the interference terms arising in the scattering. The frequencies of the well defined excitations are almost independent of concentration. (14 refs.)

76742 Dissociation of Abrikosov-Nielsen-Olesen vortices. L.G.Jensen, P.J.Steinhardt (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5549-56 (1 May 1983). In this paper the authors discuss how Abrikosov-Nielsen-Olesen vortices can act as impurities that seed first-order phase transitions. The seeding mechanism comes about through dissociation of what is normally considered to be topologically stable defects. They discuss the conditions necessary for dissociation in which the core, which contains the seed of stable phase, becomes unstable and grows radially, converting the system from a metastable phase to

a stable phase. They also discuss some peculiar characteristics of vortices in superfluid $^3\text{He-}^4\text{He}$ and the vortex dissociation that occurs when the $^3\text{He-}^4\text{He}$ phase separates at low temperatures. (6 refs.)

67.80 SOLID HELIUM AND RELATED QUANTUM CRYSTALS

76743 Nuclear susceptibility and Zeeman-exchange relaxation time of solid ^3He along the melting curve below 15 mK. K.Ichikawa (Faculty of Sci. & Technol., Kinki Univ., Osaka, Japan), Y.Mori, T.Hata, C.Kanamori, H.Okamoto, T.Kodama, T.Shigi.

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1676-81 (May 1983). Nuclear magnetic susceptibility and Zeeman-exchange relaxation time T_{ZX} of solid ^3He have been measured by the pulsed NMR method using the Pomeranchuk cooling technique between 15 mK and 0.97 mK in a static field of about 70 gauss. A magnetic transition to the antiferromagnetic phase was observed at 1.00 mK where the susceptibility decreased to 42% of its maximum value. This drop in susceptibility coincides with the abrupt leveling of ^3He pressure in the cooling process which shows thermodynamically a phase transition due to abrupt decrease of solid ^3He entropy. The magnitude of T_{ZX} is consistent with the one estimated from BPP (Bloembergen-Purcell-Pound) theory, but the observed temperature dependence can not be explained on this basis. (14 refs.)

76744 Pulsed NMR studies in solid H_2 . I. Solid echoes and nuclear spin-spin relaxation times after a two-pulse sequence. I.Yu, S.Washburn, H.Meyer (Dept. of Phys., Duke Univ., Durham, NC, USA).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.369-400 (May 1983). Describes a systematic pulsed NMR study on several solid H_2 samples with ortho concentration X between 10% and 70% at temperatures between 0.08 and 2 K, where the intramolecular dipole-dipole interaction is the dominant spin-spin interaction. Nuclear spin echoes from a two-pulse sequence are studied using a RF phase-coherent spectrometer and they show the quasiquadrupolar nature of the echo formations. A density matrix method applied to the system of ortho- H_2 molecules can account for most of the observed properties of the echoes. From the decay of the echo envelope the authors obtain information on the static intermolecular nuclear interactions and the local inhomogeneous magnetic field distribution. (24 refs.)

76745 Pulsed NMR studies in solid H_2 . II. Stimulated echoes and cross relaxation times. I.Yu, S.Washburn, M.Calkins, H.Meyer (Dept. of Phys., Duke Univ., Durham, NC, USA).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.401-22 (May 1983). For pt.1 see *ibid.*, vol.51, p.369 (1983). A study of the stimulated echo following a three-pulse sequence is presented for solid H_2 samples with ortho concentrations X between 15% and 65%, and over the temperature range between $T = 0.1$ and 2 K. The stimulated echo decay time τ_E is found to increase sharply upon cooling through the transition into the long-range ordered phase for $X > 0.55$. However, the increase is only gradual during the progressive orientational ordering in the HCP phase for $X \leq 0.55$. The predictions of a density matrix method for the stimulated echo amplitude are used for comparison with the experiment. A phenomenological approach shows that the results for τ_E can be interpreted in terms of a combination of longitudinal relaxation times T_1 and cross relaxation times T_{12} , the latter expressing the flip-flop transitions between the spin states of neighboring ortho- H_2 molecules. These cross relaxation times are calculated from τ_E and T_1 data and found to increase with linewidth as the orientational ordering progresses. (21 refs.)

Measurements of the Kapitza resistance and Onsager cross-coefficient for the ^4He crystal-superfluid interface See Entry 76723

67.90 OTHER TOPICS IN QUANTUM FLUIDS AND SOLIDS (E.G. NEUTRON-STAR MATTER)

76746 Supercooling of liquid H_2 and the possible production of superfluid H_2 . H.J.Maris, G.M.Seidel, T.E.Huber (Dept. of Phys., Brown Univ., Providence, RI, USA).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.471-87 (June 1983). The authors discuss the extent to which it may be possible to supercool liquid H_2 below its normal freezing temperature. They show that there is a significant prospect that H_2 could be supercooled to arbitrarily low temperatures, and that in this way superfluid H_2 might be produced. A brief discussion is given of the properties of the anticipated superfluid phase. (38 refs.)

76747 Calculation of nuclear-spin-relaxation rate for spin-polarized atomic hydrogen. R.M.C.Ahn, J.P.H.W.Eijnde, B.J.Verhaar (Dept. of Phys., Tech. Hogeschool Eindhoven, Eindhoven, Netherlands).

Phys. Rev. B (USA), vol.27, no.9, p.5424-32 (1 May 1983). Approximations introduced in previous calculations of spin relaxation for spin-polarized atomic hydrogen are investigated by carrying out a more exact coupled-channel calculation. With the exception of the high-temperature approximation, the approximations turn out to be justified up to the 10^{-3} level of accuracy. It is shown that at the lowest temperatures for which experimental data are available, the high-temperature limit underestimates relaxation rates by a factor of up to 2. For a comparison with experimental data it is also of interest to pay attention to the expression for the atomic hydrogen relaxation rates in terms of transition amplitudes for two-particle collisions. Discrepancies by a factor of 2 among previous derivations of relaxation rates are pointed out. To shed light on these discrepancies the authors present two alternative derivations in which special attention is paid to identical-particle aspects. Comparing with experiment, they find their volume relaxation rate to be in better agreement with measured values than that obtained by other groups. The theoretical surface relaxation rate, however, still shows a discrepancy with experiment by a factor of order 50. (22 refs.)

68.10 FLUID SURFACES AND INTERFACES WITH FLUIDS

(inc. surface tension, capillarity, wetting and related phenomena)

76748 Surface tension measurements for the n-alcohols in the temperature range from -40°C to $+40^{\circ}\text{C}$. R.Strey, T.Schmeling (Max-Planck-Inst. für Biophys. Chem., Göttingen, Germany). *Ber. Bunsenges. Phys. Chem. (Germany)*, vol.87, no.4, p.324-7 (April 1983). The surface tension of the n-alcohols from methanol through n-octanol were measured between about -40°C and $+40^{\circ}\text{C}$. The surface tension data can be represented with $\pm 0.5\%$ by linear functions of temperature over the considered temperature range. The increase of surface tension with increasing chain length of the alcohol is in accord with the theorem of corresponding states. (18 refs.)

76749 On the validity of certain integro-differential equations for the density-orientation profile of molecular fluid interfaces. P.Tarazona, R.Evans (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.279-82 (20 May 1983). The status of some recently proposed integro-differential equations for the density-orientation profiles, $\rho(r_i, \omega_i)$, of non-uniform molecular fluids is examined. Two of the equations derived by Gubbins (1980), which involve derivatives with respect to angular coordinates ω_i , are shown to be incorrect and corrected versions are proposed. The implications of the results for pairwise correlations and for the surface tension of the liquid-gas interface are discussed. (8 refs.)

76750 The surface tension of water. N.R.Pallas, B.A.Pethica (Clarkson Coll. Potsdam, NY, USA). *Colloids & Surf. (Netherlands)*, vol.6, no.3, p.221-7 (April 1983). The air-water interfacial tension has been redetermined by the capillary rise and Wilhelmy plate methods at 25°C . The drop-volume method, using the Harkins-Brown corrections, gives good values for glass tips if appropriate precautions are taken. The effect of replacing air with He or N_2 at 1 atm. was not measurable, but CO_2 at 1 atm. gives a significant lowering of the interfacial tension. Measurements over the range $20-45^{\circ}\text{C}$ are also reported. (21 refs.)

68.20 SOLID SURFACE STRUCTURE

76752 Hybridization and surface relaxation in diamond-like crystals. V.Barone, G.Dei (Cattedra di Chimica Teorica, Univ. di Napoli, Napoli, Italy). *THEOCHEM (Netherlands)*, vol.11, no.1-2, p.173-85 (June 1983).

The role of variable hybridization in the description of covalent solids is discussed. As an example the criterion of 'maximum overlap-straight bond' is applied to investigate changes in plane-to-plane spacings induced normal to a free (111) surface in diamond-like crystals. The simple model used appears to have general validity and suggests that formation of a free surface always determines a 'localized' pattern of perturbed lattice distances in the direction perpendicular to the surface. Numerical results are in agreement with previous cluster computations and indicate a heavily damped oscillation of interatomic distances around a mean value when proceeding inwards from the free (111) surface for both diamond and silicon. The results support the so-called H-model for the (111) surfaces of diamond-like crystals, and exclude the possibility of graphite-like delocalization. (53 refs.)

76753 Lateral stress-induced blistering of aluminium films under helium irradiation. H.J.Whitlow (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark), S.E.Donnelly, M.Renier, A.A.Lucas. *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.347-9 (April 1983). Discusses the phenomena of blistering and flaking of surfaces irradiated with energetic He ions. The choice of appropriate models is far from clear. The authors' aim has been not to unambiguously resolve this problem, but rather to illustrate that under conditions where an easy fracture plane is clearly defined, blisters, seemingly identical to those observed under conventional conditions, can be found as a result of lateral stresses only. (12 refs.)

76754 Phase transition on stepped silicon surfaces. V.I.Mashanov, B.Z.Ol'shanetskii (Inst. of the Phys. of Semiconductors, Acad. Sci., Novosibirsk, USSR).

JETP Lett. (USA), vol.36, no.8, p.355-8 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.290-2 (20 Oct. 1982). [received: June 1983]

Phase transitions are discovered on clean silicon surfaces inclined away from (111) toward [211] planes. At temperatures below 850°C , systems of ordered steps with height equal to three interplanar distances d_{111} , which reform reversibly into steps with height equal to a single interplanar distance above 850°C , form on such surfaces. (12 refs.)

76755 The concentration of surface $\text{V}=\text{O}$ species on oxidized vanadium oxide catalysts. A.Miyamoto, A.Hattori, Y.Murakami (Dept. of Synthetic Chem., Nagoya Univ., Nagoya, Japan). *J. Solid State Chem. (USA)*, vol.47, no.3, p.373-5 (May 1983).

On the basis of an oxidized surface state model of vanadium oxides, Andersson (1982) has theoretically shown that the concentration of surface $\text{V}=\text{O}$ species on oxidized V_2O_3 or V_2O_4 catalyst is higher than that on V_2O_5 catalyst. The authors confirm the validity of this inference experimentally. V_2O_5 was prepared by the thermal decomposition of ammonium metavanadate at 773K for 3 hr in a stream of O_2 . XPS spectra of the preoxidized catalysts were obtained Shimadzu ESCA 750 photoelectron spectrometer. (5 refs.)

76756 An X-ray photoelectron spectroscopy study of the surface segregation of LaNi_5 heated in H_2 -atmosphere. Hu Gang, Wu Yue (Changchun Inst. of Appl. Chem., Acad. Sinica, China). *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.3, p.341-5 (March 1983).

Due to its ability to store large amount of reversible hydrogen—a promising energy carrier of the future— LaNi_5 has aroused much interest. Researches on its hydrogen-absorbing ability, the surface structures as well as the position of hydrogen in LaNi_5 hydride have been extensively carried out in the last few years. The authors report results obtained by XPS-study of the change of the surface composition of LaNi_5 heated in H_2 -atmosphere. (8 refs.)

76757 XPS studies of SiO_2 surface layers formed by oxygen ion implantation into silicon. D.Schulze, J.Finster (Sektion Chem., Karl-Marx-Univ. Leipzig, Leipzig, Germany), E.Hensel, W.Skorupa, U.Kreissig. *Phys. Status Solidi A (Germany)*, vol.76, no.1, p.K21-4 (16 March 1983). The authors report the examination of SiO_2 surface layers of 160 nm thickness formed by ion implantation into silicon. XPS measurements into the depth were done after a step-by-step chemical etch of the SiO_2 layer. The chemical nature and the thickness of the transition layer to the silicon were determined. For comparison the same measurements were done on thermal oxide. (9 refs.)

76758 On the stability of surface martensite in β -phase Cu-Zn alloys. F.C.Lovey (Centro Atomico Bariloche, Bariloche, Argentina), J.Ferron, L.S.Del Bernardez, M.Ahlers.

Scri. Metall. (USA), vol.17, no.4, p.501-4 (April 1983).

The subsurface layer composition has been investigated by combining Auger electron spectroscopy with ion beam bombardment. It can be concluded from the results that the most likely reason for the formation of a surface martensite is a compositional change of the near-surface region due to the oxide layer which acts as a sink for Zn atoms. (17 refs.)

76759 LEED studies of several structural models of the $\text{Si}(100)$ surface. G.J.R.Jones, B.W.Holland (Dept. of Phys., Univ. of Warwick, Coventry, England).

Solid State Commun. (USA), vol.46, no.8, p.651-5 (May 1983).

Dynamical LEED calculations are performed for the Poppendieck $c(4 \times 2)$ and the Chadi (2×1) , $c(2 \times 2)$, $p(2 \times 2)$ and (4×2) structures. All the non- (2×1) structures give forbidden beams that are far too intense, and comparison with experiment shows that none of the structures individually, nor any combination of the Chadi structures, can represent the $\text{Si}(100)$ surface. (16 refs.)

76760 Surface crystallography of thin films by electron diffraction in the STEM. K.Truszkowska, M.J.Yacamán (Inst. de Física, Univ. Nacional Autónoma de México, Mexico City, México).

Surf. Sci. (Netherlands), vol.127, no.3, p.L159-64 (May 1983).

It is shown that by using STEM microdiffraction it is possible to obtain surface reflections from thin metallic films. The technique is demonstrated for a gold film. Reflections from the surface reproduce the (23×1) superlattice for the (111) surface previously reported in the literature. It is also shown that the film surface consists of reconstructed (5×1) domains which when interlocking produce the (23×1) pattern. (12 refs.)

76761 Observation of superstructure formation on $\text{Rh}(001)$ by laser-pulse assisted field evaporation. Chi-fong Ai, T.T.Tsong (Phys. Dept., Pennsylvania State Univ., University Park, PA, USA).

Surf. Sci. (Netherlands), vol.127, no.3, p.L165-71 (May 1983).

Pulsed-laser assisted field evaporation of the $\text{Rh}(001)$ plane produces a $p(2 \times 2)$ structure. This structure can be destroyed by pulsed-laser heating the surface in the absence of an applied field, and can be restored to near perfection if the pulsed-laser heating is done in an applied field of 3 to 4 V/Å. The degree of order increases with the applied electric field. The observed $p(2 \times 2)$ surface is therefore a field stabilized structure. (14 refs.)

76762 Synthesis of cellular amorphous films on the surfaces of alloys with a periodic-pulse CO_2 laser. A.A.Katsnel'son, V.A.Alekseev, V.Yu.Baranov, A.A.Mezhevov, N.A.Khatanova, E.E.Kamzueva (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.462-3 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1072-4 (Sept. 1982). [received: May 1983]

The authors report an attempt to synthesize an amorphous film with a uniform cellular structure on the surface of the alloy $\text{Fe}_{80}\text{P}_{10}\text{C}_7$. They used a periodic-pulse closed-loop CO_2 laser with a maximum pulse repetition frequency of 1 kHz. The $\text{Fe}_{80}\text{P}_{10}\text{C}_7$ alloy was produced in a vacuum furnace; the sample was a cylinder with a diameter ~ 9 mm. (7 refs.)

76763 Rapidly solidified microstructure in surface layers of laser-alloyed Mo on Fe-C substrates. T.R.Tucker, A.H.Clauer, S.L.Ream, C.T.Walters (Batelle Columbus Labs., Columbus, OH, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.541-5. Shaped continuous-wave laser beams have been used to alloy molybdenum coatings into Fe-C substrates. The Mo overlay was first deposited by the plasma spray process in an inert gas environment. Slowly scanned laser radiation then melted a layer 2 to 5 times the thickness of the original coating causing the two metallic species to mix. Melt proceeded from the coating/substrate interface, the Mo melt temperatures being significantly higher than that of the base material. Fusion zone microstructures for indi-

dual melt passes appeared to be homogeneous, and molybdenum composition was found to be relatively uniform. With overlapping melt passes, the microstructures became more complex with heat effects apparent in the overlap regions. (4 refs.)

68.25 MECHANICAL AND ACOUSTICAL PROPERTIES OF SOLID SURFACES AND INTERFACES

(for tribology, see 62.20P and 81.40P)

76764 Velocity measurement of multiple leaky waves on germanium by line-focus-beam acoustic microscope using FFT. J.Kushibiki, K.Horii, N.Chubachi (Dept. of Electrical Engng., Tohoku Univ., Sendai, Japan). *Electron. Lett. (GB)*, vol.19, no.11, p.404-5 (26 May 1983). $V(z)$ curves obtained by the acoustic line-focus beam are deformed due to multiple leaky waves. A novel velocity measurement method with FFT is developed for a $V(z)$ curve analysis. Experiments are performed for a (111) Ge sample and two mode spectra are separately measured corresponding to two velocities for a leaky SAW and a leaky pseudo-SAW existing on the boundary of water/sample. (4 refs.)

76765 Means of plastic self-indentation of solids in contact. Ya.E.Geguzin, V.G.Kononenko (A.M. Gorki State Univ., Kharkov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1997-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3503-5 (Nov. 1982). [received: May 1983]

If an interaction at the molecular level takes place along the place of contact between two solids, i.e. if a specific energy $\Delta\alpha = 2\alpha - \alpha_0$ is evolved (α and α_0 are the surface and boundary energies, respectively), plastic deformation may occur in the contact zone because of the generation and motion of dislocation loops. Obviously, the extent of plasticity is limited because an increase in the contact area reduces the contact stresses to some limiting value below which the dislocation sources become inactive. The authors consider specifically this factor which limits the means and assume that the active relaxation mechanisms disperse dislocation pile-ups which might give rise to stresses counteracting the capillary stresses. (3 refs.)

68.30 DYNAMICS OF SOLID SURFACES AND INTERFACE VIBRATIONS

76766 Vibrational interaction between hydrogen atoms adsorbed on Pd(100). C.Nyberg, C.G.Tengstall (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).

Phys. Rev. Lett. (USA), vol.50, no.21, p.1680-3 (23 May 1983). Vibrational energy shifts have been observed for the substitutionally disordered $p(1 \times 1)(\text{H}+\text{D})$ and $c(2 \times 2)(\text{H}+\text{D})$ structures on Pd(100). Between 0 and 1 hydrogen concentration the hydrogen vibrational energy shifts by 3.5 and 0.5 meV for the $p(1 \times 1)$ and $c(2 \times 2)$ structures, respectively. It is argued that the relatively large energy shift of the $p(1 \times 1)$ structure is mainly due to adatom-adatom interaction mediated by the metal electrons. (23 refs.)

68.40 SURFACE ENERGY OF SOLIDS; THERMODYNAMIC PROPERTIES

76767 Surface free energy and stress of a Lennard-Jones crystal. J.Q.Broughton, G.H.Gilmer (Bell Labs., Murray Hill, NJ, USA). *Acta Metall. (USA)*, vol.31, no.6, p.845-51 (June 1983). Surface excess free energies and stresses have been calculated by molecular dynamics techniques for three low-index crystal faces. Properties of the (111),

(100) and (110) faces of a face centered cubic crystal composed of Lennard-Jones particles have been investigated. Large variations in the surface stress are present; the (111) and (100) exhibit compressive and tensile stress, respectively, over the temperature range from 0K to the triple point. The excess free energies of the three faces are approximately equal at temperatures within 10% of the triple point. The values obtained for the free energies of crystal-vapor, crystal-liquid and liquid-vapor interfaces are used to calculate the thickness of a quasi-liquid layer on the crystal-vapor interface at temperatures near the triple point. (35 refs.)

68.45 SOLID-FLUID INTERFACE PROCESSES

(see also 82.65 Sorption and accommodation coefficients)

76768 Strongly bound chemisorption state for benzene on silicon (111). M.N.Piancastelli (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA), F.Cerrina, G.Margaritondo, A.Franciosi, J.H.Weaver.

Appl. Phys. Lett. (USA), vol.42, no.11, p.990-1 (1 June 1983). Dramatic differences were observed between the room-temperature reactivity of benzene on cleaved Si and on cleaved Ge and GaAs with synchrotron-radiation photoemission. No evidence of benzene adsorption was observed on Ge or GaAs. On Si the authors unexpectedly observed a strongly bound state, probably due to the formation of phenylic-like C-Si bonds. (8 refs.)

76769 A MINDO/3 approach to the chemisorption of hydrogen on graphite. F.Illas, F.Sanz, J.Virgili (Dept. de Quimica-Fisica, Univ. de Barcelona, Barcelona, Spain).

THEOCHEM (Netherlands), vol.11, no.1-2, p.79-86 (June 1983). The MINDO/3 method is applied to the chemisorption of hydrogen on graphite using a finite model for the surface. Various cluster models are used in order to establish the influence of cluster size. Hydrogen atoms are used to avoid edge effects. The process appears to be endothermic and a potential barrier is found for adsorption over a carbon atom and over the bond connecting two nearest neighbours carbon atoms. Adsorption over the center of the hexagonal lattice appears to be unfavorable. Results suggest that a model having ten carbon atoms and eight hydrogen atoms is good enough as a graphite surface model. (31 refs.)

76770 A MINDO/3 approach to the chemisorption on graphite of electrophilic adsorbates. F.Illas, F.Sanz, J.Virgili (Dept. de Quimica-Fisica, Univ. de Barcelona, Barcelona, Spain).

THEOCHEM (Netherlands), vol.11, no.1-2, p.87-93 (June 1983). The MINDO/3 method has been applied to the chemisorption of atomic carbon and nitrogen on a finite cluster model of the graphite surface consisting of ten carbon atoms and eight hydrogen atoms. The process appears to be endothermic and potential barriers have been calculated for adsorption onto a carbon atom onto the bond connecting two nearest neighbour carbon atoms and onto the center of the hexagonal graphite ring. Chemisorption onto the center of the hexagonal ring involves cross-overs between different states in the region around the maximum. Results suggest that the UHF method is more appropriate than the RHF method in the case of atomic carbon chemisorption. (24 refs.)

76771 Rates of molecular desorption from solid surfaces: adsorption site dependence for CO on Ni(100). J.N.Allison, Y.Zeiri, A.Redondo, W.A.Goddard, III (Arthur Amos Noyes Lab. of Chem. Phys., California Inst. of Technol., Pasadena, CA, USA).

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.387-91 (27 May 1983). The role of different adsorption sites on the rate of desorption of CO from Ni(100) surfaces has been studied using the classical stochastic diffusion theory (CSDT) formulation. The microscopic parameters of the system (force constants and bond energies) have been obtained from ab initio cluster calculations (Ni_4 and Ni_{20} clusters) with generalized valence bond wavefunctions. In good agreement with experiment, the authors' calculations show that desorption occurs in two temperature ranges: 400-600K and 150-250K. In the higher-temperature range, the one-fold and two-fold sites are primarily responsible for the desorption rate, while for the lower-temperature range, the four-fold (weakest binding site) is dominant (experimentally achieved by poisoning the surface with S). (13 refs.)

76772 Quasiclassical trajectories study on the two-dimensional model of the dissociative chemisorption of H_2 on a lithium cluster surface. J.Vojtik, J.Savrdra (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), J.Fiser.

Chem. Phys. Lett. (Netherlands), vol.97, no.4-5, p.397-402 (27 May 1983). A two-dimensional $\text{H}_2\text{-Li}_8$ potential surface of 'diatomics-in-molecules' quality is constructed and used in a quasiclassical trajectory model study of dissociative adsorption of H_2 on the cluster surface. The effect of the translational and vibrational energy of H_2 on the outcome of the collision with the surface is discussed. (18 refs.)

76773 Properties of thermally modified controlled porous glasses (CPG). I. Influence of additional thermal treatment of CPG on adsorption processes on its surface. A.L.Dawidowicz, I.Choma (Dept. of Chem. Phys., Inst. of Chem., Maria Curie Sklodowska Univ., Lublin, Poland).

Mater. Chem. & Phys. (Switzerland), vol.8, no.4, p.323-36 (April 1983). Controlled porous glasses (CPG) are the sorbents and supports of chemically bonded phases very widely applied in chromatographic columns for the separation of polymers and biopolymers by means of gel permeation and affinity chromatography. The chemical structure of CPG surface can easily be changed by additional heating of porous glass. Such thermal modification leads to the enrichment of the surface in boron atoms. In consequence, the prepared materials possess specific surface properties. Some adsorption isotherms obtained for chemically different compounds on the CPG surfaces thermally treated in various ways are presented. (23 refs.)

76774 Cluster calculations of the $\text{H}_2\text{O}/\text{Pt}(111)$ system. J.Paul, A.Rosen (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1231-8 (April 1983). The electronic interaction between water and a Pt(111) surface as evaluated for different $\text{Pt}(\text{H}_2\text{O})_n$ clusters is discussed. Hartree-Fock-Slater (HFS) one-electron ground state energies, ionization potentials, partial densities of states, and Mulliken occupation numbers are related to bonding shifts, as well as initial and final state screening for different orientations of the molecule. The formation of $\text{Pt-H}_2\text{O}$ bonds are sensitive to the orientation since surface oriented H atoms bridge the spatial separation between O $2p$ and Pt $5d$ orbitals and thus increase the intermixing of metal and adsorbate orbitals. The dipole moment and the net charge of the H_2O molecule is also discussed. Finally, approximations of the metal- H_2O potential for use in statistical models of the liquid-metal interface are suggested. (21 refs.)

- 76775** A study on the orientation of imidazoles on copper as corrosion inhibitor and possible adhesion promoter for electric devices. S.Yoshida, H.Ishida (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6960-9 (1 June 1983). The structure of various imidazoles on the surfaces of copper and gold mirrors has been studied by Fourier transform infrared reflection-absorption spectroscopy in order to elucidate the molecular mechanisms of corrosion inhibition of metal surfaces by imidazoles. Heptadecylimidazole, undecylimidazole, phenylimidazole, and imidazole were used to investigate the orientation of the imidazole ring and the accompanying side groups. When a gold mirror was withdrawn slowly from an ethanol solution of undecylimidazole, the imidazole ring adsorbed onto the surface flatly and the C-C bond of the hydrocarbon chain became parallel to the surface. A similar trend was observed on all imidazole derivatives studied. The orientation of the outer layers was disturbed when the thickness was increased. With a copper mirror, the structure of the imidazole at room temperature depended on the method of adsorption. A slowly withdrawn sample showed a predominant complex formation whereby the solution placed dropwise on the copper surface showed a combination of complexes, randomly orientated layers, and oriented layers similar to gold. The heat treatment at 80°C eliminated the difference caused by the adsorption methods. Upon complex formation, the orientation of the imidazole became random. This complex is tentatively assigned to diundecylimidazolato copper(II), an inner complex with copper. Further heat treatment at 150°C yielded another complex. The structure of undecylimidazole adsorbed from an acidic aqueous solution on a copper mirror has also been studied. The imidazole adsorbed very rapidly to form a thick layer due to the acceleration of complex formation by the activated imidazole ring. A similar structure in the imidazole layers was obtained both from an ethanol solution and an acidic aqueous solution. However, coadsorption of the small amount of acid used remains to be a question. Again, the heat treatment at 150°C yielded the infrared spectrum similar to the complex obtained from the ethanol solution. (48 refs.)
- 76776** Effect of adsorption of vapours on the electrical conductivity of a series of some naphthyl polyenes: Adsorption and desorption kinetics. A.Sircar, B.Mallik, T.N.Misra (Optics Dept., Indian Assoc. for the Cultivation of Sci., Calcutta, India). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.401-5 (1983). Deals with the change in semiconductivity of a series of naphthyl polyenes of the type $R-(CH=CH)_n-R$, where R stands for the naphthyl group and $n=1-6$, on adsorption of vapours of some organic solvents at a constant sample temperature. Appreciable enhancement in the conductivity is observed. Such enhancement depends on the chemical nature of the solvent and also on the vapour pressure. The desorption is much slower than that of adsorption. Both the adsorption and desorption kinetics follow the modified Roginsky-Zeldovich relation. Kinetics for the compounds having odd- n is distinctly different from those with even- n . The results show that in all these vapour-semiconductor systems, the adsorption is a two-stage process. (9 refs.)
- 76777** The adsorption of ammonia on an Fe(110) single-crystal surface studied by high-resolution electron energy-loss spectroscopy (EELS). W.Erley, H.Ibach (Inst. für Grenzflächenforschung und Vakuumphys., KFA Jülich, Jülich, Germany). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.31, no.2, p.161-74 (May 1983). The EELS spectra of ammonia adsorbed on an Fe(110) surface at 110K reveal four different adsorption states of molecular ammonia with increasing coverage: chemisorption at 'on-top' sites, chemisorption at multi-coordinated sites, adsorption in a second layer, and multilayer condensation. Thermal processing of an ammonia-covered sample to 155K causes desorption of both the condensed phase and the second layer without any fragmentation of ammonia. Further heating of the sample leads to a much weaker desorption of molecular ammonia up to a temperature of 260K. EELS spectra recorded after heating to 290K show only small amounts of atomic nitrogen and hydrogen present on the surface, indicating partial decomposition of ammonia. The formation of species such as NH_2 (ads) or NH (ads) during the thermal-processing experiments could not be observed. (17 refs.)
- 76778** Quantum chemical studies of chemisorption at anion or cation sites of the GaP (110) surface. Coverage dependence of adsorption energy and equilibrium in cases of positive and negative partial charge injection. W.Lorenz, C.Engler, A.Nechwatal, G.Adler (Sektion Chem., Karl-Marx-Univ. Leipzig, Leipzig, Germany). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.203-12 (1 May 1983). Chemisorption of electronegative or electropositive atoms at anion or cation sites of a relaxed GaP (110) surface is investigated in the TB approximation, with parameters corresponding to fluorine or lithium adsorption. Local densities of states and the dependence of the surface Fermi energy, partial charge injection, adsorption energy, and adsorption equilibrium upon the adsorption density are reported. (15 refs.)
- 76779** Modelling and illustration of a penetration mechanism for hydrogen into metal. C.Opitz, F.Dubler (Sektion Chem., Friedrich-Schiller-Univ., Jena, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.505-12 (16 April 1983). The insertion of hydrogen into metals is investigated in the system $H/Nb_3I_8^{3+}$ using the cluster-bulk analogy. Energies and charge distributions are calculated in the frame of EHT approach for some positions of the H atom along a possible penetration path. The insertion process is characterized by a small activation energy (50 kJ/mol) and negativation of hydrogen. The hydrogen atom is strongly bound in the centre of the $Nb_3I_8^{3+}$ -cluster. The bond energy is 260 kJ/mol. Furthermore, the charge distribution is drawn in some selected positions of the reaction path to give a qualitative survey on the penetration mechanism in an illustrative manner. (13 refs.)
- 76780** Adsorption of oxygen on GaAs(001) surfaces by UPS. D.Flamme (Sektion Chem., Karl-Marx-Univ. Leipzig, Leipzig, Germany), E.-H.Weber. *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.K163-6 (16 April 1983). The authors have made adsorption experiments on clean GaAs (001) surfaces prepared by sputtering with 400 eV Ar^+ ions and annealing at 770K. They present the ultraviolet photoemission spectra of a clean GaAs (001) surface which was then exposed to dry oxygen (10^2 , 10^4 L) and finally annealed at 770K. Marked changes occur at ≈ 5 and ≈ 10 eV binding energy, and the emission at 10 eV disappears on annealing. (5 refs.)
- 76781** Transitions of adsorbates on random substrates. W.Kinzel (Inst. für Festkörperforschung der Kernforschungsanlage Jülich, Jülich, Germany). *Phys. Rev. B (USA)*, vol.27, no.9, p.5819-20 (1 May 1983). It is pointed out that impurities and defects destroy any order-disorder phase transition of adsorbates on surfaces. (11 refs.)

- 76782** Determination of the molecular symmetry of acetylene on Ni(001) by electron-impact scattering. N.J.DiNardo, J.E.Demuth, P.Avouris (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5832-5 (1 May 1983). Angle-dependent electron-energy-loss measurements of acetylene on Ni(001) are used to deduce molecular symmetry on the surface by consideration of selection rules for vibrational excitation by impact scattering. Chemisorbed acetylene has C_{2v} symmetry with a mirror plane along (110) and a molecular plane tilted relative to the surface. (13 refs.)
- 76783** Orientational ordering of commensurate $Fe(CO)_5$ monolayers on graphite. R.Wang, H.Taub (Dept. of Phys., Univ. of Missouri, Columbia, MO, USA), H.Schechter, R.Brener, J.Suzanne, F.Y.Hansen. *Phys. Rev. B (USA)*, vol.27, no.9, p.5864-7 (1 May 1983). Elastic neutron diffraction and Mossbauer spectroscopy have been used to study the structure, orientational-disordering (OD) transition, and melting of an $Fe(CO)_5$ submonolayer adsorbed on Grafoil. The OD transition occurs between 150 and 167K from a two-sublattice ($\sqrt{7} \times \sqrt{21}$) structure to a nearly ($\sqrt{7} \times \sqrt{7}$) phase in which the molecules are believed to rotate about the surface normal. Mossbauer spectra exhibit a more abrupt variation with temperature near melting at 170K than through the OD transition. (18 refs.)
- 76784** Raman scattering by optically absorbing molecules adsorbed on 'smooth' Ag and Au surfaces: crystal violet. E.Burstein (Phys. Dept., Univ. of Pennsylvania, Philadelphia, PA, USA), G.Burns, F.H.Dacol. *Solid State Commun. (USA)*, vol.46, no.8, p.595-9 (May 1983). Reports data on the resonant Raman scattering (RS) by crystal violet (CV) adsorbed on Ag and Au surfaces. The data show that the RS and luminescence by CV on a smooth Au surface is greater by an order of magnitude than that on a smooth Ag surface. These results, which are contrary to what one expects from mechanisms that depend on the complex dielectric constant of the metal substrate, are attributed to contributions that depend on the chemical bonding of the CV molecules with the metal substrate. (9 refs.)
- 76785** Effect of surface reconstruction on the adsorption of Ge on clean $Si(111)$. P.Chen, D.Bolmont, C.A.Sebenne (Lab. de Phys. des Solides, Univ. Pierre & Marie Curie, Paris, France). *Solid State Commun. (USA)*, vol.46, no.9, p.689-91 (June 1983). The effect of ultrahigh vacuum deposition of Ge below and at monolayer (ML) coverage onto a 7×7 reconstructed clean $Si(111)$ surface held at room temperature is studied by low energy electron diffraction (LEED), Auger electron spectroscopy (AES) and photoemission yield spectroscopy (PYS). The results are compared to those obtained on 2×1 reconstructed clean $Si(111)$: (i) the Si dangling bond states are replaced by Ge dangling bond states at submonolayer coverages in both cases; (ii) the 7×7 reconstruction persists below 1 ML, it is not replaced by a $\sqrt{3} \times \sqrt{3}$ $R30^\circ$ at $1/3$ ML as it was on the 2×1 ; and (iii) the coverage below 1 ML is not homogeneous on the 7×7 reconstruction. This behaviour can be explained by the influence of the inhomogeneities associated with the 7×7 reconstruction. (17 refs.)
- 76786** Layer-dependent shifts in ionization potential and Auger energies for Kr/Cu (110). T.Mandel, G.Kaindl (Inst. für Atom- und Festkörperforschung, Freie Univ. Berlin, Berlin, Germany), K.Horn, M.Iwan, H.U.Middelmann, C.Mariani. *Solid State Commun. (USA)*, vol.46, no.9, p.713-16 (June 1983). Photoelectron spectra of the krypton 3d core-levels and MNN Auger spectra of krypton mono- and multilayers on Cu(110) have been recorded with synchrotron radiation. The Kr-3d line is found to shift to higher binding energies by 0.73 eV for first- and second-layer adsorption, respectively. This value is much larger than the work function decrease for Kr monolayer adsorption, $\Delta\phi = -0.29$ eV. The shift in Auger line energies is found to be about three times larger than the 3d line shift. These observations can be readily explained in terms of image-charge screening of the hole states. (16 refs.)
- 76787** The melting line for ethylene on graphite. J.Z.Larese, R.J.Rollefson (Phys. Dept., Wesleyan Univ., Middletown, CT, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.L172-8 (May 1983). Using the minimum in the nuclear magnetic spin-lattice relaxation time versus temperature as an indicator of melting the authors have mapped out the solid-fluid phase boundary for ethylene adsorbed on graphite. At low coverages the ethylene forms a self-bound monolayer solid with a melting temperature of about 68K. The molecules in the solid retain orientational mobility down to 55K, the lowest temperatures explored. (12 refs.)
- 76788** Diffusion of hydrogen on metal surfaces: strong coupling limit. M.D.Miller (James Franck Inst., Univ. of Chicago, Chicago, IL, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.383-402 (May 1983). Recently DiFoggio and Gomer (1980, 1982) measured diffusion coefficients for $^1H/W(110)$ and $^2H/W(110)$ using the field emission fluctuation method. Qualitatively, they found two temperature regimes: high temperature thermally activated behavior and a low temperature regime of temperature independent diffusivity. The present author examines in detail the possibility that the thermal regime is due to phonon assisted tunneling (small polarons). By means of a Kubo formulation, the high temperature real part of the frequency dependent diffusivity is calculated. It is concluded that for $H/W(110)$ a polaronic mechanism would require an implausibly large adatom-phonon coupling. (33 refs.)
- 76789** The formation of a surface iodide on Ni(100) and adsorption of I_2 at low temperatures. R.G.Jones, C.F.McConville, D.P.Woodruff (Dept. of Phys., Univ. of Warwick, Coventry, England). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.424-40 (May 1983). Iodine adsorption on clean Ni(100) has been investigated using low energy electron diffraction (LEED) and Auger electron spectroscopy (AES). At temperatures below 340K a saturated surface of adsorbed iodine atoms in a $c(2 \times 2)$ structure is observed. Adsorption of iodine on clean Ni(100) at temperatures in excess of 370K forms a structure identified as a single layer of the layered compound NiI_2 on the metal substrate. Solid iodine is shown to grow epitaxially on both the $c(2 \times 2)$ chemisorbed surface and the surface iodide at temperatures less than 185K. Heating to $185 < T < 226$ K leaves a physisorbed molecular iodine layer, while on returning to room temperature the original $c(2 \times 2)$ or iodide is restored. (17 refs.)
- 76790** The temperature dependence of the interaction of oxygen with Pd(111): a study by photoemission and Auger spectroscopy. D.L.Weissman-Wenocur, M.L.Sheik, P.M.Stefan, I.Lindau, W.E.Spicer (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.513-25 (May 1983). The temperature dependence of the different binding states of oxygen on Pd(111) has been studied using photoemission spectroscopy and Auger spectroscopy. By examining the oxygen 2s binding energies, three distinct states are observed, which are identified as surface chemisorbed oxygen, oxygen incorporated into the first Pd layers, and subsurface oxygen. Changes in the relative oxygen Auger peak heights for 1000K exposure temperature are explained if the oxygen is assumed to become more negatively charged as it

penetrates the Pd surface. A model for the interaction of oxygen with the Pd(111) surface is proposed. (21 refs.)

76791 A LEED-AES study of the structure of sulfur monolayers on the Mo(100) crystal face. M.Salmeron, G.A.Somorjai (Dept. of Chem., Univ. of California, Berkeley, CA, USA), R.R.Chianelli. *Surf. Sci. (Netherlands)*, vol.127, no.3, p.526-40 (May 1983). The formation of ordered phases of sulfur on the molybdenum (100) crystal face has been studied by low energy electron diffraction (LEED), Auger electron spectroscopy (AES) and thermal desorption spectroscopy (TDS). Sulfur was deposited from a S₂ molecular flux streaming out of an Ag₂S containing electrochemical cell inside the UHV chamber. The use of a controlled flux of S₂ allowed the careful determination of saturation values for the monolayer, as well as the formation of multilayers of sulfur. This allowed the calibration of Auger intensities in terms of sulfur coverage. Various ordered structures were observed by LEED for different values of the S coverage. Real space models for these structures are proposed that satisfy the coverage values observed and place sulfur atoms only on high symmetry four-fold sites on the (100) molybdenum surface. (22 refs.)

76792 The role of sulfur in oxygen adsorption on niobium. A.P.Kazantsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1406-7 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2289-90 (Nov. 1982). [received: May 1983]

Surfaces are always purified of surface and bulk contaminants before metal surfaces are cleaned and purified. Sulfur atoms are very frequently observed on metal surfaces when samples are exposed to air or heated because sulfur atoms segregate out from the interior. In some cases these sulfur atoms may affect the adsorption properties. The author studied adsorption of oxygen on a pure polycrystalline niobium surface by Auger electron spectroscopy. The chemical bonding of oxygen to metal surfaces is known to be altered when the metal is oxidized or during adsorption and segregation of impurity atoms; as a result, both the shape and the energy shifts of the Auger peaks are changed. The author recorded the undifferentiated Auger peaks in order to use the changes in the area underneath the oxygen peak to follow the changes in oxygen concentration in the analyzed surface region. (9 refs.)

76793 Adsorption of O₂ and CO on thin films of palladium. V.D.Vankar, R.W.Vook, B.C.De Cooman (Dept. of Chem. Engng. & Materials Sci., Syracuse Univ., Syracuse, NY, USA). *Thin Solid Films (Switzerland)*, vol.102, no.4, p.313-26 (29 April 1983). The adsorption of O₂ and CO on polycrystalline and (111) monocrystalline thin palladium films formed by vapor deposition has been studied by means of Auger electron spectroscopy (AES), low energy electron diffraction (LEED) and mass spectrometry. The palladium film thicknesses ranged from 15 to approximately 1500 Å. The experiments were carried out at 298K. Surface topographical effects were studied in various ways, one of which was a method consisting of repeated alternating vapor deposition of palladium and gaseous exposure. In all cases studied, no LEED pattern other than the normal Pd(1×1) pattern was observed after gaseous exposures up to 6000 langmuir of O₂ or 7200 langmuir of CO. However, AES showed clearly that some O₂ and CO adsorbed on polycrystalline and monocrystalline surfaces that were either contaminated or rough. Thick (1500 Å) smooth Pd(111) films grown on mica showed no evidence of significant O₂ or CO adsorption, and in both cases the AES intensity ratio of the O(512 eV) line to the Pd(329 eV) line was near zero. (28 refs.)

76794 Photon stimulated ion desorption from Na₂WO₃. R.L.Benbow, M.R.Thuler, Z.Hurtych (Phys. Dept., Northern Illinois Univ., Dekalb, IL, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.6-7. The authors have studied photon-stimulated desorption (PSD) of O⁺ ions from Na₂WO₃ in the range 30 eV ≤ hν ≤ 85 eV. The results show the potential for using the Knotek-Feibelman interaction as a bonding-site sensitive probe of certain species on the surface. (2 refs.)

76795 Sorption of hydrogen and deuterium in a glassy Pd-Si alloy by a bending-cantilever method. B.S.Berry, W.C.Pritchett (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.249-53. The dilatation caused by the sorption of H and D in amorphous samples of melt-spun Pd₈₂Si₁₈ and sputter-deposited Pd₈₁Si₁₉ has been measured at room temperature for ambient charging pressures P up to 760 torr. By comparison with the strength of the Gorsky relaxation, it is concluded that (a) the dilatations per hydrogen and deuterium atom are identical and independent of concentration and (b) the non-linearity of the dilatation vs. P^{1/2} isotherms is due solely to a deviation from Sieverts' law. The isotherms exhibit a distinct isotope-dependence, of a similar nature to that for crystalline Pd. A sputter-deposited film is found to dissolve more H or D than a melt-spun ribbon, due possibly to a less structurally-relaxed configuration. (3 refs.)

(inc. bicrystals; for grain boundaries, see 61.70N)

76796 Kinetics of self-interstitials generated at the Si/SiO₂ interface. K.Taniguchi, D.A.Antoniadis (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA), Y.Matsushita. *Appl. Phys. Lett. (USA)*, vol.42, no.11, p.961-3 (1 June 1983).

The kinetics of self-interstitials in silicon were investigated by monitoring oxidation stacking faults on backside oxidized silicon wafers in the temperature range 1100-1200°C in a wet O₂ ambient. The diffusion coefficient and thermal equilibrium concentration of self-interstitials were obtained by optimizing model parameters to match calculated and experimental observations of growth of oxidation stacking faults at the front surface of silicon wafers protected from oxidation by a composite SiO₂/poly Si/Si₃N₄ film. (22 refs.)

76797 Anodic bonding of imperfect surfaces. T.R.Anthony (General Electric Res. & Dev. Centre, Schenectady, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2419-28 (May 1983).

The intimate surface contact necessary for anodic bonding of a metal to a glass is examined in terms of the electrostatic forces which promote this contact and surface imperfections which prevent this contact. Surface imperfections that are considered include foreign particles, isolated hillocks, and periodic curved and angular surfaces. With curved and angular surfaces, a critical voltage exists that causes spontaneous mating of the surfaces by elastic or plastic deformation. Below this voltage, intimate surface contact is achieved by viscous flow. For isolated hillocks and foreign particles, surface conformation generally occurs by viscous flow because of large stress concentrations at these imperfections. The resulting time required for intimate surface contact is a very sensitive function of the imperfection size. (25 refs.)

76798 High resolution imaging of the interfacial region in metal-insulator-semiconductor and Schottky diodes. M.A.Green, A.W.Blakers (Joint Microelectronics Res. Centre, Univ. of New South Wales, Kensington, Australia), O.L.Krivaneck. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2885-7 (May 1983).

Interfacial oxides can greatly influence the properties of metal-semiconductor heterojunctions as demonstrated by recent work on metal-insulator-semiconductor solar cells. The physical structure of such interfacial regions is examined using high resolution electron microscopy. Simultaneous imaging of the lattice structure on both sides of the interfacial region is reported for the first time. (6 refs.)

68.55 THIN FILM GROWTH, STRUCTURE, AND EPITAXY

(for techniques of crystal growth and film deposition, see 81.10 and 81.15)

76799 Use of an overlay-film configuration to improve contrast of low-angle electron diffraction in thin films with columnar microstructure. S.Nakahara, A.F.Hebard (Bell Labs., Murray Hill, NJ, USA). *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.141-4 (April 1983).

Periodicities associated with columnar microstructure have been observed in the electron diffraction patterns obtained from a thin-film overlay structure. This structure consists of a copper/copper-oxide film containing a small regularly-spaced array of columns and covered by a polycrystalline gold film. Both the transmitted and diffracted beams within the gold film act as independent incident beams for the underlying copper film, the latter giving rise to the formation of sub-diffraction rings around strongly-diffracted spots of gold lines. These sub-rings, appearing only because of this double diffraction effect, were found to represent the spatially-periodic distribution of columns in the copper film. (7 refs.)

76800 Substrates for epitaxial growth of hexaferrite films. F.Licci, S.Rinaldi, T.Besagni (Istituto MASPEC, CNR, Parma, Italy). *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.163-5 (April 1983).

By suitable substitution of iron by nonmagnetic trivalent cations in hexagonal ferrites, the authors succeeded in obtaining compounds which are paramagnetic at room temperature, isomorphous with R-Fe₁₂O₁₉, where R=Ba, Sr or Pb, and have lattice parameters close to the hexaferrite ones. These materials

may be suitable substrates for epitaxial deposition of magnetic hexaferrite films. (4 refs.)

76801 An analysis of the process of recrystallization of silicon thin films with either a scanning laser or strip heater. H.E.Cline (General Electric Corporate Res. & Dev., Schenectady, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2683-91 (May 1983).

An analysis of the temperature, stress distribution, and crystal growth was made to model the process of recrystallization of silicon thin films with either a scanning laser or strip heater. The temperature distribution of a wafer with one or more thin film layers was calculated using both Green's function and Fourier series methods. With increasing velocity, the temperature profile becomes asymmetric and the maximum temperature decreases. Heat flow is influenced by the applied heat profile, the layer thicknesses, thermal properties, heat transfer coefficient between the wafer and substrate, and the velocity of the heat zone. If the heat zone is wider than the wafer thickness the temperature profile may be approximated using a one-dimensional model. Thermal stresses are generated by either a nonuniform temperature or differential thermal expansion between layers. Temperature differences along the film that are greater than 10°C may plastically deform the silicon film. To crystallize cell-free single-crystal thin films a critical ratio of the thermal gradient to the solidification velocity must be exceeded. The criterion for the crystallization of defect-free material is derived in terms of the solidification rate, heat transfer, and stability of the planar solid-liquid interface during crystal growth. It is predicted that defect-free silicon films are possible at rates below 0.005 cm/sec from a comparison with conventional growth of silicon single crystals. (20 refs.)

76802 Spin coated amorphous chalcogenide films: structural characterization. G.C.Chern, I.Lauks (Dept. of Electrical Engng. & Sci., Univ. of Pennsylvania, Philadelphia, PA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2701-5 (May 1983). Thin films that are substantially amorphous arsenic sulfide have been prepared by spin deposition from solutions of *n*-propylamine or *n*-butylamine. These materials have been investigated by nuclear magnetic resonance, infrared absorption, and elemental analysis. A structural model is suggested based on As_2S_3 clusters surrounded by amine as an amine salt. (58 refs.)

76803 Defect evaluation of Si MBE film. Y.Ota (Bell Labs., Reading, PA, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.439-48 (April-May 1983). Crystalline defects in (100) and (111) Si MBE films were evaluated by various chemical etching techniques. Although the defects and defect patterns in an MBE film were similar to those observed in a CVD film, they were generated by different mechanisms because of the vast difference in the growth conditions of the two epitaxial techniques. Furthermore, (111) Si MBE films contained a unique defect pattern which has not been observed in CVD films. Defect etch patterns in a Si MBE film are described in terms of the cause of the defects. (20 refs.)

76804 Morphology of organometallic CVD grown GaAs epitaxial layers.

D.H.Reep, S.K.Ghandhi (Rensselaer Polytech. Inst., Troy, NY, USA). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.449-57 (April-May 1983). Growth conditions and resulting epitaxial layer morphology are presented for atmospheric pressure OM-CVD layers of GaAs, grown at 700°C on (100), (100)+ 3° , (110), (110), (111)Ga, and (111)As oriented substrates. The substrate orientation found most favorable for useable devices is either the (100) or misoriented (100). For these substrates, the epitaxial layer morphology is largely independent of reactant flux, in contrast to the results found for the other orientations. A simple model is presented to explain the morphology of layers grown on the (111)As and (111)Ga faces. Finally, impact of the morphology study on the electrical characteristics of the layers, and on the growth of polycrystalline layers, is discussed. (39 refs.)

76805 Interface reactions and grain growth processes in poly-GaAs deposited on molybdenum substrates by the organometallic process. S.K.Shastry, S.K.Ghandhi (Rensselaer Polytech. Inst., Troy, NY, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.458-62 (April-May 1983). Describes grain growth processes for polycrystalline gallium arsenide on molybdenum substrates. Growth was carried out by the pyrolytic decomposition of trimethylgallium and arsine in hydrogen. The ability of the organometallic process to allow the growth of gallium arsenide over a wide temperature range is exploited in the initial nucleation and growth phase to obtain full coverage of the substrate. A heat treatment step is used to provide grain expansion and results in a surface with a rippled character. It is proposed that this comes about by the dissociation of GaAs at the interface, due to strong Mo-As reactions at the annealing temperature, resulting in regrowth of GaAs from a liquid-like phase. Eventual growth of a device quality, active layer is accomplished by conventional CVD growth at $650\text{--}700^\circ\text{C}$, resulting in an average grain size of $6\text{ }\mu\text{m}$ for a $6\text{--}7\text{ }\mu\text{m}$ thick overall structure. (15 refs.)

76806 Influences of substrate surface structures and water vapor on the nucleation, epitaxy and graphoepitaxy of tin thin films grown on potassium chloride substrates. T.Osaka, T.Kawana, T.Noijima (Dept. of Metall. Engng., Waseda Univ., Tokyo, Japan), K.Heinemann.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.509-24 (April-May 1983). Thin films of tin were prepared by vapor deposition on vacuum-cleaved potassium chloride substrates with and without exposure to water vapor, and on air-cleaved substrates. Examination by optical and electron microscopy revealed that the cleavage surface of the substrate had fine structures composed of six characteristic features. On clean substrates, {100} epitaxial films and graphoepitaxial films were produced, depending upon the surface structures of the substrate. For the case of air-cleaved and water-vapor-exposed substrates, a decrease of the {100} epitaxy and modifications of the substrate surfaces were observed. Possible mechanisms for these findings are discussed. (31 refs.)

76807 Growth kinetics of LPE $\text{Ga}_{0.83}\text{Al}_{0.17}\text{Sb}$ layers grown from supercooled solutions. M.Mebarki, P.Salsac, A.Jouille, G.Bougnat (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.637-40 (April-May 1983). GaSb and $\text{Ga}_{0.83}\text{Al}_{0.17}\text{Sb}$ alloys were grown by liquid phase epitaxy from supercooled solutions. The composition profiles were determined and the thicknesses of the layers were measured as a function of the growth time and the cooling rate. The data are quantitatively consistent with a simple diffusion limited growth model, available for binary and ternary compounds. The diffusivity of antimony was found to be $D_{\text{Sb}} = 7.1 \times 10^{-10}\text{ cm}^2\text{ s}^{-1}$ for GaSb (at 560°C) and $D_{\text{Sb}} = 6.7 \times 10^{-10}\text{ cm}^2\text{ s}^{-1}$ for $\text{Ga}_{0.83}\text{Al}_{0.17}\text{Sb}$ (at 550°C). (17 refs.)

76808 Electroepitaxy from a limited solution volume: growth kinetics calculations. Z.R.Zytikiewicz (Inst. of Phys., Polish Acad. of Sci., Warszawa, Poland).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.665-74 (April-May 1983). The analytical expression for the growth rate is obtained and applied, as an example, to GaAs. The advantages of using thin solution layers in electroepi-

taxy of GaAs instead of the previously used systems are discussed. It is shown that limitation of the solution height causes a reduction of the influence of diffusion on the growth rate and results in better homogeneity of the grown layers. Moreover, elimination of convective mixing in the solution volume allows easier control of the growth process. (32 refs.)

76809 Mechanism of graphite baffle gettering in organometallic vapor phase epitaxy; adsorption of trimethylaluminum on graphite. D.W.Kisker, D.A.Stevenson (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).

J. Electron. Mater. (USA), vol.12, no.2, p.459-82 (March 1983). The adsorption of trimethylaluminum (TMA) on graphite surfaces was investigated using a controlled gas flow system and a molecular beam mass spectrometer. Values for the amount of TMA adsorbed on graphite surfaces under a variety of conditions were determined by analyzing the transient response attending abrupt changes in input gas composition. Significant adsorption of TMA was observed, with a heat of adsorption of 15.7 kcal/mole . When graphite baffles are used in organometallic vapor phase epitaxy, there are several important practical consequences of the adsorption: the gettering of impurities, the doping efficiency, and difficulties in establishing sharp junctions. (14 refs.)

76810 Auger and AC impedance studies of the RF sputter deposited Fe_2O_3 films. S.C.Tjong (Dept. of Chem. Engng., Univ. of Saskatchewan, Saskatoon, Saskatchewan, Canada).

Mater. Res. Bull. (USA), vol.18, no.4, p.421-7 (April 1983). Thin iron oxide films were prepared by RF sputtering techniques. X-ray diffraction and Auger electron spectroscopic techniques were used to determine the structure of the films. The results showed that the film prepared with such techniques has an $\alpha\text{-Fe}_2\text{O}_3$ structure. AC impedance techniques were also applied to determine the electrochemical properties of the films. It was found that the film exhibited semiconducting properties in the borate buffer solution at the anodic potentials below 0.73 V vs. RHE. (5 refs.)

76811 Formation of semiconductor epitaxial films by pulse heating crystallization or regrowth. L.N.Aleksandrov (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Phys. Status Solidi A (Germany), vol.76, no.1, p.179-90 (16 March 1983). The contemporary state and perspectives of methods used, namely thermodynamic and kinetic characteristics of amorphous film crystallization and regrowth processes by pulse (laser, electron beam etc.) heating are considered. On the base of experimental data thermodynamic diagrams of the processes of normal and accelerated, explosive or shock, crystallization of amorphous film (in the solid state) or regrowth (through the liquid phase) are given. An analysis of the acting mechanism by comparing the waiting time t_0 for the appearance of the first nucleus of the crystalline or liquid phase with the time Δt of heating pulse is made. Calculation of possible size of the crystalline blocks and of the time of their growth gives ≈ 1 to $100\text{ }\mu\text{m}$ by ≈ 1 to $100\text{ }\mu\text{s}$. The ways for improving the structure of polycrystalline epitaxial semiconductor films with large blocks are discussed. (51 refs.)

76812 Shock crystallization of films. L.N.Aleksandrov, F.L.Edelman (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Phys. Status Solidi A (Germany), vol.76, no.2, p.409-27 (16 April 1983). The phenomenon of shock (explosive) film crystallization with a rate several orders higher than the normal one at the transition of films from the amorphous to the crystalline state is considered. Experimental data for films of antimony, germanium, silicon, silicon dioxide, and silicon oxynitride, for the structure and mechanism of crystallization are discussed in detail. The connection has been established between the temperature and energy of the phase transition and elastic stresses and heat conduction of amorphous and crystalline phases with an energy of external effects and initial temperature. The model of the process of shock crystallization in films has been developed and the difficulties of the theory of this phenomenon have been revealed. The possible time of the self-sustaining shock crystallization has been estimated depending on the film temperature for structures on the basis of amorphous SiO_2 , Si films-Si, shock crystallization is required for its quantitative description. (39 refs.)

76813 Accommodation of misfit in heterostructures with continuous and islands films. E.M.Trukhanov (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).

Phys. Status Solidi A (Germany), vol.76, no.2, p.437-45 (16 April 1983). An equation is derived for the equilibrium dislocation configuration in a slip plane with a stress distribution depending on a single coordinate. The equation allows one to determine the critical film thickness at which dislocations are first formed in various heterostructures. Critical thicknesses are discussed for systems with a continuous film, with a semi-infinite film, bounded by a straight edge, and with a series of parallel strips on the substrate surface. The theoretical data are in agreement with the observed ones for continuous films. They are confirmed by experimental results for the heterostructure with a discontinuous film. The peculiarities of stable and unstable equilibrium dislocations are discussed for the mentioned heterostructures. (21 refs.)

76814 Multiple phase transitions in GeTe films. Dynamics and film structure. O.Bostanjoglo (Optisches Inst., Tech. Univ. Berlin, Berlin, Germany).

Phys. Status Solidi A (Germany), vol.76, no.2, p.525-31 (16 April 1983). Electron pulse-crystallization of amorphous $\text{Ge}_{0.8}\text{Te}_{0.2}$ films, serving as a model substance for multiple transitions, is investigated by 'time-resolved' TEM. Precipitation and amorphization of Te crystallites, and generation of different textures of crystalline GeTe successively occur during a μs annealing pulse, depositing 1.1 kW/cm^2 in the film. The growth velocities of the different GeTe textures range from 0.3 to 10 m/s at the beam centre, dropping by more than one order of magnitude beyond the irradiated area. The various phases spatially separate in concentric regions, fast transitions being characterized by a sharp demarcation between the participating phases. (17 refs.)

76815 Evidence of the formation of twins by deformation and 'growth-accidents' in evaporated thin films of gold. A.H.King (Dept. of Materials Sci. & Engng., State Univ. of New York, Stony Brook, NY, USA).

Phys. Status Solidi A (Germany), vol.76, no.2, p.629-36 (16 April 1983). Transmission electron microscope observations of twins in epitaxially grown gold single crystals are presented. It is demonstrated that most, though not all, of the twins found in such specimens arise from deformation of the material during handling. A mechanism for the formation of grown-in twins is proposed to explain some of the observed features. (8 refs.)

68.60 PHYSICAL PROPERTIES OF THIN FILMS, NONELECTRONIC

76816 Adhesion of aluminum films deposited on glass. F.Kobayashi, A.Nomura, T.Kano (Faculty of Engng., Shinshu Univ., Nagano, Japan). *J. Fac. Eng. Shinshu Univ. (Japan)*, no.53, p.45-53 (Dec. 1982). In Japanese. Adhesion of aluminum films deposited on glass substrate was experimentally studied for effects of the substrate temperature, substrate cleaning processes, and time lapse after deposition. Aluminum films were obtained at various substrate temperatures ranging from room temperature to 200°C and glass substrates were arranged by application of three different cleaning processes. The adhesion was measured by the scratch method. With rise in substrate temperature, the adhesion increases slightly in the range from room temperature to 100°C, but abruptly in the range 100-125°C, saturating above 150°C. Films obtained above 150°C exhibit a higher adhesion by a factor of 50 than those obtained at room temperature. As for the change in adhesion with time, at 312 hr films obtained at room temperature and those obtained at 200°C exhibit adhesions 10 and 1.5 times as high as those at 24 hr, respectively, with the latter films always kept higher in adhesion than the former. The three different cleaning processes applied on substrate had no effect on the adhesion. (10 refs.)

76817 Determining the frictional properties of thin films of lubricants. I.V.Kragel'skii, N.V.Gitis (A.A. Blagonravov Inst. of Mech. Engng., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.644-5 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1125-7 (Aug. 1982). [received: May 1983]

The tendency toward an increase in loading and heat stress at points of friction gives rise to the use of highly viscous and plastic lubricating materials and to a decrease in the roughness of rubbing surfaces, and leads to an increase in the danger of seizing and sticking as a result of the 'film starvation' effect. This effect consists of the fact that, under certain conditions, the thin films on the rubbing surfaces are worn away at the regions of actual contact and do not have time to be restored in the spaces between these regions. To investigate the effect in an actual frictional contact, the authors applied to the cylindrical surfaces of hardened steel rollers a regular microrelief of type IV by vibrational rolling. The profile of the rollers over the circumference was similar to the periodic profile of the packet of plates. (4 refs.)

68.90 OTHER TOPICS IN THE STRUCTURE AND NONELECTRONIC PROPERTIES OF SURFACES AND THIN FILMS

76818 The transmission electron microscopy of 1 to 2 nm rhodium particles dispersed on γ-Al₂O₃. S.B.Newcomb, W.M.Stobbs, J.A.Little (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.191-6 (16 March 1983). The primary problem in the transmission electron microscopical examination of small supported catalyst particles is differentiating them from their support. Methods for doing this using relatively low resolution dark field and bright field Fresnel techniques are described. High resolution images of rhodium particles, identified by this method, are discussed in relation to current models for their structure and morphology. (11 refs.)

71.10 GENERAL THEORIES AND COMPUTATIONAL TECHNIQUES

76819 Some considerations on U_{eff} values entering the Hubbard Hamiltonian. J.Friedel, C.Noguera (Phys. des Solides, Univ. Paris XI, Orsay, France). *Int. J. Quantum Chem. (USA)*, vol.23, no.4, p.1209-21 (April 1983). One of the simplest ways to take into account correlations between electrons in solid state physics, beyond the usual one electron approximation, is to use the Hubbard Hamiltonian $H = \sum_{ij} \beta_{ij} C_i^\dagger C_j + U \sum_i n_{i\uparrow} n_{i\downarrow}$ ($1-\sigma_i$), $n_i = C_i^\dagger C_i$. Although it corresponds to very severe approximations, since intersite correlations are neglected, and since the whole problem is reduced to a single parameter U , it is already very difficult to solve, and exact solutions exist in only a few cases. It is thus not desired to introduce more complications in the Hamiltonian; but it could be interesting to understand, at least qualitatively, which processes influence the value taken by parameter U . The question arises in concrete cases, such as transition metals or organic molecules; comparing experiments and approximate solutions of the Hubbard Hamiltonian has been shown that, in most cases, the value of U that yields the best fit is very different from what would be expected from atomic considerations. For instance, if one wants to study correlation on atoms of type M , a pure atomic point of view would affect to U the change in energy U_{at} in the redox-type

equation $2M \rightleftharpoons M^+ + M^-$. However it seems that solid state effects plays an important role and the authors discuss three of them. (12 refs.)

76820 A generalized approximation of the Fermi-Dirac integrals. X.Aymerich-Humet, F.Serra-Mestres, J.Millan (Dept. d'Electricitat i Electronica, Univ. Autònoma de Barcelona, Barcelona, Spain). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2850-1 (May 1983). An analytical approximation for the Fermi-Dirac integral $F_j(\eta)$ for real j is proposed. This approximation works for $-\infty < \eta < \infty$, with an error of 1.2% for $-1/2 < j < 1/2$ and 0.7% for $1/2 < j < 5/2$. The error increases with j for higher j values. (11 refs.)

76821 Relationship between the Kittler-Falicov method and the coherent potential approximation for disordered alloys. G.Gomez-Santos (Dept. de Física Fundamental, Univ. Autònoma, Madrid, Spain). *J. Phys. C (GB)*, vol.16, no.14, p.L453-8 (20 May 1983). The decoupling procedure involved in the configurational average of the Kittler-Falicov method for alloys is discussed. As a result of this analysis, a relationship between this method and the coherent potential approximation is established. (11 refs.)

76822 Simultaneous relaxation of nuclear geometries and electric charge densities in electronic structure theories. P.Bendt, A.Zunger (Solar Energy Res. Inst., Golden, CO, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1684-8 (23 May 1983).

A simple formalism is presented, within the density-functional approach, which constitutes a powerful scheme for directly calculating the ground-state energy of systems with arbitrarily located nuclei and their accompanying electrons. The method permits simultaneous relaxation of both the atomic geometries and the electronic charge densities of polyatomic systems towards equilibrium. It circumvents the far less efficient indirect (consecutive) approach in which the equilibrium geometry is determined after calculation of energies on the Born-Oppenheimer surface. (14 refs.)

76823 MO study of counter anions of TMTSF: electronic structure of NO_3^- , BF_4^- , ClO_4^- and FSO_3^- . H.Teramae, K.Tanaka, K.Shiotani, T.Yamabe (Dept. of Hydrocarbon Chem., Kyoto Univ., Kyoto Japan). *Solid State Commun. (USA)*, vol.46, no.8, p.633-7 (May 1983). The electronic structure and geometrical structure of NO_3^- , BF_4^- , ClO_4^- and FSO_3^- anions are studied by means of the ab initio molecular orbital method. According to the results obtained, the central atoms of these anions are all positively charged and the surrounding atoms negatively charged. The bonding nature of ClO_4^- and FSO_3^- is similar to that of XF_6^- ($X = \text{P, As}$ and Sb) previously studied, and has a coordination-like character. However, BF_4^- and NO_3^- show a covalent-like character. The ion radii of these anions are determined from the total density contour maps obtained by the calculation. (19 refs.)

76824 Density of unidimensional finite disordered system particles. L.A.Zil'berman.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.752-60 (May 1983). In Russian. The structure of states is studied in one-dimensional finite disordered systems. The random potential $v(x)$ is considered as a Gaussian white noise. In a quasi-elastic region the energy particle density can be divided into two terms: the first is changed at distances of about a localization length and the second is a modulated standing wave with a period of π/ω . At negative energy $\omega = -q^2$ the boundary influence vanishes at a distance of about q^{-1} . (11 refs.)

71.20 ELECTRONIC DENSITY OF STATES DETERMINATIONS

(inc. energy states of liquid semiconductors; see also 65.40 Lattice and electronic heat capacity)

76825 Effects of energy dependence in the electronic density of states on some normal state properties. B.Mitrovic, J.P.Carbotte (Dept. of Phys., McMaster Univ., Hamilton, Ontario, Canada).

Can. J. Phys. (Canada), vol.61, no.5, p.758-83 (May 1983). The authors study the effects of energy dependence in the electronic density of states (EDOS) on the electron quasiparticle properties in the normal state. The Migdal-Eliashberg equations (1958, 1960) generalized to include a non-constant EDOS are derived in the isotropic approximation. By numerical solution of the electron self-energy equations in the normal state, they assess the effect of the interplay of the energy dependence in the EDOS, the electron-phonon interaction, and/or elastic impurity scattering on the electron quasiparticle properties. Self-consistency requirements are fully discussed. (55 refs.)

76826 Effects of energy dependence in the electronic density of states on some superconducting properties. B.Mitrovic, J.P.Carbotte (Dept. of Phys., McMaster Univ., Hamilton, Ontario, Canada).

Can. J. Phys. (Canada), vol.61, no.5, p.784-801 (May 1983). The authors study the influence of energy dependence in the electronic density of states (EDOS) on the single particle tunneling characteristics into a superconductor. The Migdal-Eliashberg equations (1958, 1960) generalized to the case of a nonconstant EDOS are derived. Three equations are involved, one for the gap, another for the renormalization function, and a new one for the chemical potential shift which does not appear in the conventional formulation. Numerical solutions of these equations are obtained, from which current voltage characteristics are calculated for a model EDOS. The 'inversion' of the calculated tunneling conductance shows that the effects of the peaks in the EDOS, on the scale of several Debye energies are important and cannot necessarily be reproduced within the usual Eliashberg theory by working with some effective value of electron-phonon spectral density $\alpha^2(\omega)F(\omega)$ and/or Coulomb parameter μ^* without introducing unphysical features to these parameters. (57 refs.)

76827 Model calculations of local electron and phonon densities of states in bimetallic superlattices. M.Menon, G.B.Arnold (Univ. of Notre Dame, Notre Dame, IN, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5508-18 (1 May 1983). The authors have analytically obtained the exact Green's functions for electrons and phonons in a bimetallic superlattice. The electrons are treated in the tight-binding approximation, and the phonons are of one acoustic branch in a lattice with nearest-neighbor coupling. The most interesting effects arise near the interfaces when the acoustical or electronic coupling between layers is large compared to the intralayer coupling. In this large coupling case, the local phonon density of states at low frequency is enhanced by a linear contribution due to interface modes. The appearance of electronic interface states in the local density of states is discussed. The impact of the results on superconducting properties is considered. The influence of zone-folding effects is found to be small. (16 refs.)

71.25 NONLOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

76828 Interacting stereo-irregular chains: a model for conducting polymers. S.Stafstrom, R.Riklund, K.A.Chao (Dept. of Phys. & Measurement Technol., Univ. of Linköping, Linköping, Sweden).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1363-83 (April 1983). Interacting stereo-irregular chains of hydrogen atoms, which simulate the topological structure of many conducting polymers, are generated by a computer and solved numerically with the unrestricted Hartree-Fock method with a modified spin polarized potential. The electron localization is investigated, and a mechanism for the interchain tunneling is discovered. Local antiferromagnetic ordering is derived which may explain the AF behavior observed in some conducting polymers. (30 refs.)

76829 Electronic states of disordered binary alloys with strong off-diagonal disorder. S.Yoshino (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan), K.Hoshino, M.Goda.

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1687-91 (May 1983). The properties of eigenvalues and/or eigenfunctions of disordered binary alloys A_xB_{1-x} with off-diagonal disorder are investigated numerically in the two-dimensional square lattice with 50×50 lattice sites. Special attention is focused on the eigenfunctions near the band edges of A or B subbands when t_{AB} is much larger than t_{AA} and t_{BB} , where t_{ij} s ($i, j = A$ or B) are transfer energies between i and j sites. It is shown that the states near the inner band edges are highly localized within A or B atom clusters and the states near the outer band edges are localized within the clusters of atoms connected by AB bonds. The numerical results of the density of states as a function of t_{AB} are consistent with previous results and support the importance of the repulsive effect between bands. (9 refs.)

76830 A CNDO/INDO crystal orbital model for transition metal polymers of the 3d series-basis equations. M.C.Bohm (Inst. für Organische Chem., Univ. Heidelberg, Heidelberg, Germany).

Theor. Chim. Acta (Germany), vol.62, no.4, p.351-72 (1983). The crystal orbital formalism in the right-binding approximation is combined with a recently developed CNDO/INDO model for transition metal species of the 3d series in order to allow band structure calculations on the Hartree-Fock SCF level for one-dimensional (1D) chains with organometallic unit cells. The band structure approach based on the CNDO and INDO approximation can be used for any atom combination up to bromine under the inclusion of the 3d series. The matrix elements for the tight-binding Hamiltonian are derived for an improved CNDO and INDO framework. The total energy of the 1D chain is partitioned into one-center contributions and into two-center increments of the intracell and intercell type. (65 refs.)

76831 A CNDO/INDO crystal orbital model for transition metal polymers of the 3d series—the band structure of nickel(II)glyoximate. M.C.Bohm (Inst. für Organische Chem., Univ. Heidelberg, Heidelberg, Germany).

Theor. Chim. Acta (Germany), vol.62, no.4, p.373-96 (1983). The band structure of nickel(II)glyoximate has been studied by means of semiempirical INDO calculations implemented into the crystal orbital formalism of the tight-binding approximation. It has been shown that the crystal orbital approach allowed the rationalization of various experimental results. The theoretical model should be a suitable tool for the systematic investigation of the electronic structure of recently designed low-dimensional systems with organometallic stacking units. It can be expected that such an approach facilitates the formulation of general rules and principles that determine the physical and chemical properties of quasi one-dimensional conducting or semi-conducting polymers. (36 refs.)

71.25C Techniques of band-structure calculation (general theory, applications of group theory, analytic continuation, etc)

76832 A method for the calculation of improved band gaps in the crystal orbital formalism. M.C.Bohm (Inst. für Organische Chem., Univ. Heidelberg, Heidelberg, Germany).

Solid State Commun. (USA), vol.46, no.9, p.709-12 (June 1983). A computational method for the calculation of improved band gaps in the crystal orbital (CO) formalism based on the Hartree-Fock (HF) procedure is developed. The approach makes use of fractional k-averaged band occupation numbers in the band structure technique. An electron in the recalculated conduction band(s) feel the averaged potential of $(N-1)$ electrons. The method is applied to the LiH polymer. Semiempirical INDO CO calculations lead to an $\epsilon(k)$ lowering of nearly 3 eV for the improved conduction band in comparison to the dispersion curve of the standard variational approach. The two $\epsilon(k)$ curves are characterized due to slightly different dispersions. (22 refs.)

CNDO/S parameters of C, O, and Si for solid state calculations ... See Entry 76839

71.25H Measurement of Fermi surface parameters
(inc. dHvA, magnetoacoustic, position annihilation, and cyclotron resonance studies, etc.)

76833 Positron-annihilation measurements of the Fermi surface of copper-base solid solutions with gallium, germanium, and nickel. K.-H.Steinmetz, H.-P.Fischer (Inst. fur Metallforschung, Univ. Munster, Munster, Germany), M.Martin, E.Nembach.

Phys. Status Solidi b (Germany), vol.116, no.2, p.575-83 (1 April 1983). The [011] cross-section of the Fermi surface of Cu-rich solid solutions with Ga, Ge, and Ni is measured by positron annihilation. The 'rotating specimen' method is used. The concentrations of Ga and Ge cover the whole range of primary solid solutions; C_{Ni} extends up to 22 at.%. For all three solutes investigated, the neck radius of the Fermi surface increases monotonously with solute concentration. For a given electron per atom ratio e/a , Ga widens the neck 32% more than Ge does. All three solutes decrease the ratio of maximum to minimum diameter of the Fermi surface. The electronic structure of these solid solutions is not exclusively determined by the e/a ratio, but depends on the specific properties of the solute. The present experimental results do not support the view that the extent of primary solid solutions is mainly governed by the electron structure. (32 refs.)

76834 A theoretical investigation of the Fermi surfaces of bismuth and antimony. J.Rose, R.Schuchardt (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).

Phys. Status Solidi b (Germany), vol.117, no.1, p.213-24 (1 May 1983). The band structure and Fermi surfaces of Bi and Sb are studied with four different semiempirical pseudopotentials. By application of a Golin potential (1968) screened by the Heine-Abarankov form of dielectric function reasonable band structures are obtained. The calculated Fermi surfaces show very good agreement with the experimental data. Remaining discrepancies with respect to lower lying valence bands are analysed and compared with other calculations. (53 refs.)

76835 Electronic properties of dilute copper alloys. I. Theory. I.Mertig (Sektion Phys., Tech. Univ. Dresden, Dresden, Germany), E.Mrosan, R.Zeller, P.H.Dederichs, P.Ziesche.

Phys. Status Solidi b (Germany), vol.117, no.1, p.335-44 (1 May 1983). The electronic properties of 4d transition metal impurities and sp impurities of the third, fourth, and fifth rows of the periodic table in a Cu host are calculated self-consistently. The impurity is embedded in the perfect crystal environment and described by a single perturbed muffin-tin potential in the KKR-Green function scheme. The influence of the impurities on the de Haas-van Alphen effect (Dingle temperatures and changes in areas of the Fermi surface) and the residual resistivity are discussed. For the residual resistivity the linearized Boltzmann equation is solved taking into account the full anisotropic band structure of the host. (22 refs.)

76836 Changes in the electron structure of Fe-Ni alloys with the FCC lattice as a result of a magnetic phase transition. V.V.Bukhalenkov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.826-9 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of a change in the isomeric shift in the Mossbauer effect of ^{57}Fe nuclei in Fe-Ni alloys. This was done in the critical range of compositions corresponding to the establishment of a ferromagnetic order under the influence of temperature. The increase in the isomeric shift as a result of ferromagnetic ordering was attributed to a shift of the absolute position of the Fermi level associated with the exchange splitting of the 3d band, magnetostriuctive changes in the atomic volume, and a possible discontinuity of the second-order Doppler shift because of a change in the Debye temperature and transformation of the vibration spectrum of the nuclei. (14 refs.) A.T.

71.25R Band structure of crystalline elemental semiconductors

76837 The recursion method and a first-principles tight-binding calculation of the band structures of diamond and silicon. R.Jones, T.King (Dept. of Phys., Univ. of Exeter, Exeter, England).

Philos. Mag. B (GB), vol.47, no.5, p.481-90 (May 1983). A tight-binding first-principles calculation of the band structures of diamond and silicon is presented. The numerical crystal potential (including a local exchange-correlation term) is fitted to a superposition of simple analytic functions centred on each atom. A basis of localised s and p orbitals is calculated from this potential and fitted to a combination of Gaussians. All Hamiltonian and overlap matrix elements are then evaluated analytically, and the local density of states can be calculated by a recursion method modified to deal with overlap. An extension of the method to the study of crystal defects is discussed. (14 refs.)

76838 An operational method to model carrier degeneracy and band gap narrowing. M.S.Adler (General Electric Co., Corporate Res. & Dev. Center, Schenectady, NY, USA).

Solid-State Electron. (GB), vol.26, no.5, p.387-96 (May 1983).

An operational method of modeling heavily doped silicon to include effects of carrier degeneracy and band gap narrowing is presented. The issue of carrier degeneracy on majority carrier flow is discussed together with the question of the ambiguity in the electrostatic potential associated with identifying which band edge is narrowed. Using an exact numerical analysis of a bipolar transistor as an example it is shown that when modeling carrier flow in quasi-neutral regions, classical statistics can be used for the majority carrier and

the ambiguity in the electrostatic potential can be ignored. Overall, it is shown that for the same quasi-neutral heavily doped regions the effects of carrier degeneracy and band gap narrowing are accurately modeled within the context of classical statistics by adding the quasi field term to the minority carrier transport equation that is based on the commonly used 'band gap narrowing' data available from measurements of minority carrier transport in heavily doped regions. 76839 CNDO/S parameters of C, O, and Si for solid state calculations. P.Deak (Phys. Inst. Tech. Univ., Budapest, Budapest, Hungary).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1165-77 (April 1983).

Semiempirical methods used in cluster-type calculations must be applicable for calculating ionization potentials ('valence band') and electronic transitions ('gap'). CNDO/S seems to be an appropriate choice for this purpose. However, the solids of main interest (as, e.g. diamond and silica) contain saturated bonds for which the original parametrization does not work well. A new set of parameters was determined for C, O, and Si by fitting them to vertical ionization potentials and to singlet electronic transitions of their saturated molecules. The transferability of the parameters were also checked. By these parameters a successful description of the electronic structures of diamond and silica became possible. (63 refs.)

76840 Recent investigations on the electronic structure of the fourth and fifth group transition metal monocarbides, mononitrides, and monoxides. A.Neckel (Inst. fur Phys. Chem., Univ. Wien, Vienna, Austria).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1317-53 (April 1983).

An overview of band structure calculations on the fourth and fifth group transition metal monocarbides, mononitrides, and monoxides is given. Furthermore, the relations of three categories of experimental properties, which allow insight into the electronic structure of the above mentioned compounds, and the results of band structure calculations are discussed. Theoretical predictions are compared with experimental findings. The considered experimental properties are valence band photoemission spectra, valence band X-ray emission spectra, and optical properties. (100 refs.)

76841 Electron densities and chemical bonding in TiC, TiN, and TiO derived from energy band calculations. P.Blaha, K.Schwarz (Inst. fur Tech. Elektrochem., Tech. Univ. Wien, Vienna, Austria).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1535-52 (April 1983).

The chemical bonding in the interesting class of refractory transition metal compounds is illustrated for TiC, TiN, and TiO. Self-consistent augmented plane wave (APW) calculations are already available for these compounds. Using the respective potentials the author have repeated the band calculations on a finer k grid with the linearized APW method to obtain accurate densities of states (DOS). These DOS can be divided into local partial contributions to characterize the bonding. Further information can be obtained from a decomposition of the metal d DOS into dt_{2g} and eg symmetry components. These partial local DOS are compared into the LCAO counterpart and give a first picture of the chemical bonding in these compounds. The electron densities corresponding to the occupied valence states are obtained from the LAPW calculations. They provide further insight into characteristic trends in the series from TiC to TiO: around the nonmetal sit and density shows increasing localization; around the metal site the deviation from spherical symmetry changes from e_g to t_{2g} . These effects can be traced back to the three types of valence bands. Electron density plots of characteristic band states (all energies of a selected k point in the Brillouin zone) will be shown. These plots can describe the different types of bonding occurring in these systems. (15 refs.)

76842 Relativistic extended Huckel studies of cluster models of solid HgTe, CdTe, and PbTe: densities of states and nuclear spin-spin coupling. M.Hotokka, L.Laaksonen, P.Pyykko, A.Viste (Dept. of Phys. Chem., Abo Akad., Abo, Finland).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1685 (April 1983).

Summary form only given. Relativistic extended Huckel (REX) and EHT molecular orbital calculations have been carried out for a variety of cluster models of crystalline HgTe and CdTe. The local environment of each atom in the crystals and in the selected clusters is tetrahedral, and the largest clusters studied here are of formula $M_{10}Te_{10}$. Clusters $Hg_{10}Te_{10}$, $Hg_4Te_{13}^{18-}$, and $Hg_{13}Te_4^{18+}$, studied in wurtzite and zinc-blende isomeric forms, are found by REX double-zeta calculations to be more stable in the zinc-blende form, in agreement with the known crystal structure of HgTe and CdTe. For PbTe (NaCl structure), a cluster model Pb_6Te_6 is considered. Densities of states for clusters M_nTe_n are found to exhibit trends in reasonable qualitative agreement with available experimental data and earlier band structure calculations. For HgTe clusters there is very little difference between results for wurtzite and zinc-blende REX results, and the best overall correspondence with bulk properties occurs for the largest cluster models. Band gaps calculated by REX tend to increase in the order $PbTe < HgTe < CdTe$. Nuclear spin-spin coupling has been investigated by the REXNMR program. (5 refs.)

76843 A semi-empirical tight-binding theory of the electronic structure of semiconductors. P.Vogl (Inst. fur Theoretische Phys., Univ. Graz, Graz, Austria), H.P.Hjalmarson, J.D.Dow.

J. Phys. & Chem. Solids (GB), vol.44, no.5, p.365-78 (1983).

A nearest-neighbor semi-empirical tight-binding theory of energy bands in zincblende and diamond structure materials is developed and applied to the following sp^3 -bonded semiconductors: C, Si, Ge, Sn, SiC, GaP, GaAs, GaSb, InP, InAs, InSb, AlP, AlAs, AlSb, ZnSe, and ZnTe. For each of these materials the theory uses only thirteen parameters to reproduce the major features of conduction and valence bands. The matrix elements exhibit chemical trends, the differences in diagonal matrix elements are proportional to differences in free-atom orbital energies and the off-diagonal matrix elements obey the d^{-2} rule of Harrison et al. The lowest energy conduction bands are well described as a result of the introduction of an excited s state, s^* , on each atom. Examination of the chemical trends in this sp^3s^* model yields a crude but 'universal' sp^3s^* model whose parameters do not depend explicitly on band gaps, but rather are functions of atomic energies and bond lengths alone. The 'universal' model, although cruder than the sp^3s^* model for any

single semiconductor, can be employed to study relationships between the band structures of different semiconductors; the authors use it to predict band edge discontinuities of heterojunctions. (35 refs.)

76844 Self-consistent embedded-cluster calculations of the electronic structure of alkaline earth fluorides in the Hartree-Fock-Slater approximation. N.C.Amaral, B.Maffei, D.Guenzburger (Dept. de Física, Univ. Federal de Goiás, Goiânia, Brazil).

Phys. Status Solidi b (Germany), vol.117, no.1, p.141-53 (1 May 1983). Molecular orbital calculations are performed for clusters representing the CaF_2 , SrF_2 , and BaF_2 ionic crystals. The discrete variational method is employed, with the $\chi\alpha$ approximation for the exchange interaction; a detailed investigation of different models for embedding the clusters in the solids led to a realistic description of the effect of the neighbouring ions in the infinite crystal. The results obtained are used to interpret optical and photoelectron data reported in the literature. In the case of CaF_2 , comparisons are made with existing band structure calculations. (33 refs.)

76845 Instability of a heavily doped semiconductor near the band inversion point. M.A.Korzhuev (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1961-2 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3451-3 (Nov. 1982). [received: May 1983]

Inversion of the conduction and valence bands accompanied by vanishing of the band gap $E_g = E(L_g^-) - E(L_g^+)$ and a transition to a zero-gap state are exhibited by solid solutions of IV-VI semiconductors ($\text{Pb}_{1-x}\text{Sn}_x\text{Te}$, $\text{Pb}_{1-x}\text{Sn}_x\text{Se}$) when the pressure P , the temperature T , or the composition x are varied. The authors have used the energy band parameters of $\text{Pb}_{1-x}\text{Sn}_x\text{Se}$ solid solutions, which are typical of solutions of IV-VI semiconductors and which agree with the dependences $E_F(E_g)$ calculated using the six-band Dimmock model of the electron energy spectrum. The dependences $E(E_g)$ are recalculated on the P , T , and x scales. (7 refs.)

71.30 METAL-INSULATOR TRANSITIONS

76846 The localization transition on the Bethe lattice. H.Kunz (Inst. de Phys. Théorique, EPFL, Lausanne, Switzerland), B.Souillard.

J. Phys. Lett. (France), vol.44, no.11, p.411-14 (1 June 1983). Presents exact results concerning the localization transition on the Bethe lattice. In a certain number of situations, the authors prove the existence of a transition from extended to localized regime when varying the energy or the disorder. The density of states is analytic at the mobility edges and the exponent ν governing the divergence of the localization length is found equal to 1. (5 refs.)

76847 Theory of the Verwey transition in the mixed valence compound EuS_2 . D.Ihle, B.Lorenz (Sektion Phys., Karl-Marx-Universität Leipzig, Leipzig, Germany).

Phys. Status Solidi b (Germany), vol.116, no.2, p.539-46 (1 April 1983). The Verwey transition in EuS_2 at $T_V = 186$ K is explained on the basis of a model which takes into account the Coulomb interaction of the extra $4f$ electrons at the Eu^{2+} ions and the formation of small polarons due to the interaction with phonons. This model is treated in the Hartree and cluster variation approximations. At T_V a first-order Verwey transition is obtained. The magnitude of the observed entropy change at T_V is explained. Above T_V the polarons are found to be considerably short-range ordered. (20 refs.)

71.35 EXCITONS AND RELATED PHENOMENA (inc. electron-hole drops)

76848 Anderson transition in the exciton-impurity band in silicon. P.D.Altukhov, A.V.Ivanov, A.A.Rogachev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.9, p.401-4 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.9, p.328-31 (5 Nov. 1982). [received: June 1983]

An Anderson transition is observed in the exciton-impurity band (EIB) in Si:P with donor concentration $n_D = n \approx 1.5 \times 10^{17} \text{ cm}^{-3}$. The transition is accompanied by a sharp rearrangement of the recombination-radiation spectrum of EIB with increasing n_D in the region $n_D \approx n^*$ due to increases exciton mobility and a change in the polarization of radiation in a magnetic field. (5 refs.)

76849 On the theory of singlet and triplet charge-transfer excitons. B.J.Schmid, P.Reineker (Abteilung für Theoretische Phys., Univ. Ulm, Ulm, Germany).

Phys. Status Solidi b (Germany), vol.117, no.1, p.117-26 (1 May 1983).

A many-particle Hamiltonian for electrons which takes into account their energy in a periodic potential and in an external magnetic field, as well as their Coulomb and spin-spin interaction energies is specialized for charge-transfer excitons on a linear chain with one donor and one acceptor molecule in the unit cell. The Hamiltonian decomposes into a part of singlet excitons, which is diagonalized exactly, and a part for triplet excitons, whose diagonalization is reduced to wave vector dependent eigenvalue problems of the dimension of the unit cell. The fine-structure tensor is expressed explicitly in terms of electronic matrix elements. (20 refs.)

76850 Emission of free and bound excitons in layered GaSe crystals. Yu.P.Gnatenko, Z.D.Kovalyuk, P.A.Skubenko, Yu.I.Zhirko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Phys. Status Solidi b (Germany), vol.117, no.1, p.283-7 (1 May 1983).

The emission spectra of GaSe single crystals of ϵ -modification doped with Co of 0.001 to 0.5 wt.% concentration are investigated at different temperatures ($T = 4.2$ to 35K) using polarized light. It is shown that the wide emission band with energy 2.031 eV is due to structural defects while the other wide bands of 2.039 and 2.008 eV are due to indirect exciton transitions with radiation of TO-phonons. The narrow emission lines correspond to the decay of direct excitons bound on different defects and to their phonon satellites involving phonons of $(14.5 \pm 0.5) \text{ meV}$. The temperature dependence of a doublet structure of the free exciton emission line, which is thought to be due to the peculiarities of the GaSe crystal band structure, namely the splitting of the valence band by interlayer interaction is investigated. (15 refs.)

76851 Excitonic correlations and a first-order phase transition in an excitonic dielectric. B.A.Volkov, V.V.Tugushev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.636-8 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1374-8 (Aug. 1982). [received: May 1983]

The influence of many-particle correlations on a dielectric phase transition, is considered in systems with electron-hole pairing. The most detailed discussion is devoted to results for a model of an isotropic semimetal, whose one-electron spectra of the conduction band, and of the valence band are connected by the relation $\epsilon_c(k) = -\epsilon_v(k)$, where k is the electron quasimomentum. As the temperature is lowered, a second-order phase transition takes place at the point $T = T_c$ into the 'excitonic-dielectric' state, i.e. a condensate of electron-hole pairs is formed. In the limit of large electron density ($na_0 \gg 1$, a_0 is exciton radius, n is the concentration of electrons and holes), all correlation corrections to the self-consistent field theory are small and of the order of the parameter $T_c/\epsilon_F \ll 1$ (ϵ_F is the Fermi energy). (4 refs.)

76852 Effect of one-dimensional disorder on exciton states in semiconductors. A.Yu.Maslov, L.G.Suslina (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1928-31 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3394-400 (Nov. 1982). [received: May 1983]

A theoretical and experimental study of the effect of one-dimensional (structural) disorder on exciton states in semiconductors is reported. One-dimensional disorder is due to a random distribution of close-packed layers in the direction of the optic axis. Disorder in the stacking of layers leads to a random one-dimensional potential which localizes the motion of quasiparticles in the direction of stacking. It is shown that differences in the exciton localization energy at different points of a crystal lead to an inhomogeneous broadening of exciton states. The dependence of the broadening on the concentration of stacking faults is calculated in a model of uncorrelated distribution of close-packed layers. The results of an experimental study of the broadening of exciton states in ZnS crystals with stacking faults are reported. The measured results are quite well described by the proposed theoretical model. (16 refs.)

76853 Zeeman effect and diamagnetic shift of a free exciton in gallium arsenide crystals. L.P.Nikitin, I.B.Rusanov, R.P.Selsyan, T.V.Yezeva (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1962-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3453-6 (Nov. 1982). [received: May 1983]

The authors consider the Zeeman effect and diamagnetic shift of Wannier-Mott excitons in GaAs. The perturbation treatment of these effects has previously been shown to be valid up to $\sim 12 \text{ KOe}$. The authors examine this validity by studying the absorption spectra of thin unstressed GaAs crystals. (10 refs.)

76854 Bound states in the presence of a screened Coulomb potential in a magnetic field. S.B.Anokhin, M.V.Ivanov (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1979-80 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3478-80 (Nov. 1982). [received: May 1983]

The use of high-power light sources can create carrier densities in semiconductor crystals sufficient for a detailed experimental investigation of the screening of excitons. The simplest theoretical model for the description of this effect is an analysis of the interaction of an electron and a hole via a screened Coulomb potential. The authors report the results of numerical calculations of the energy eigenvalues for a system with a Hamiltonian operator which has the form of a cylindrical coordinate system (ρ, ϕ, z) after separation of the motion over the angle ϕ . (10 refs.)

76855 Self-localized excitons in molecular crystals with allowance for anharmonicity of the lattice and dispersion. N.I.Kislukha, A.V.Karbovskii, V.I.Ponomarenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.661-6 (May 1983). In Russian.
The possibility of self-localized exciton formation is studied in terms of the continuous approximation with allowance for anharmonicity of the lattice and dispersion. When the resonance interaction is weak and anharmonicity is strong, there, possibly, exist self-localized states alongside the exciton states. It is shown what role the crystal lattice dimensionality plays for two- and three-dimensional lattices. (5 refs.)

71.36 POLARITONS
(inc. photon-phonon and photon-magnon interactions)

76856 Two-photon transitions to exciton polaritons. A.R.Hassan (Internat. Centre for Theoretical Phys., Trieste, Italy).
Indian J. Theor. Phys., vol.29, no.3, p.203-8 (Sept. 1981).
A semiclassical theory for the creation of excitonic polariton states by two-photon absorption, via an intermediate exciton state, is given. A band model has been introduced which gives the dominant contribution to this process. A numerical calculation is found to be in good agreement with a recent observation in CuCl. (15 refs.)

76857 Optical properties of polaritons in thin crystal films. V.N.Myasnikov, S.V.Marisova, A.N.Lipovchenko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Phys. Status Solidi b (Germany), vol.117, no.1, p.109-16 (1 May 1983).
The dispersion relation for polaritons in a crystal slab of an arbitrary thickness is derived by the quantum Green function method. The equation is reduced to the classical electrodynamics form with an effective dielectric function depending on the crystal thickness. The energy and the radiation damping of polariton modes in thin anthracene crystals are calculated and compared with the experimental values based on studies of low-temperature luminescence and refractive index dispersion. (14 refs.)

76858 Observation of dispersion on magnetic polaritons. K.M.Haussler (Sektion Phys., Univ. Munchen, Munchen, Germany), J.Brandmuller, L.Merten, H.Finsterholz, A.Lehmeyer.
Phys. Status Solidi b (Germany), vol.117, no.1, p.225-8 (1 May 1983).
Far-infrared reflectivity measurements on uniaxial antiferromagnetic CoF₂ display a characteristic dispersion of the magnetic reststrahlenbands if the wave vector components of the radiation are varied by choosing different angles of incidence. Thus the expected dispersion behaviour of the so-called magnetic polaritons is demonstrated experimentally in a direct manner for the first time. The simulation of the infrared reflectivity spectra based on a generalized formula for anisotropic magnetically ordered insulators shows good agreement with the experimental results and can be used to predict even weak polariton dispersion effects. (11 refs.)

76859 Effects of a transition layer on slab polaritons. L.Wendler (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Phys. Status Solidi b (Germany), vol.117, no.1, p.241-6 (1 May 1983).
Dispersion relations are derived for polaritons in a dielectric slab, coated with a transition layer (thickness 20 to 150 Å), on a substrate. If $\tilde{\epsilon}(\omega)$ is the dielectric function of the transition layer a splitting of the dispersion curves occurs for resonances of the form $\tilde{\epsilon}(\omega_1)=\infty$ and $\tilde{\epsilon}(\omega_2)=0$ in the case of p-polarized polaritons. In the case of s-polarized polaritons the splitting is obtained only for resonances of the form $\tilde{\epsilon}(\omega_1)=\infty$. (6 refs.)

71.38 POLARONS AND ELECTRON-PHONON INTERACTIONS
(for electron-phonon interactions in lattices, see also 63.20K)

76860 Theory of solitons in molecular chains. A.A.Eremko, A.I.Sergienko (Inst. of Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.12, p.2122 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3720-2 (Dec. 1983).
The authors have shown that collective excited states of the soliton type can occur in one-dimensional molecular chains irrespective of the sign of the resonant interaction. For dipole-dipole interactions $J>0$, the neighboring molecules near a soliton are excited in phase, whereas for $J<0$, they are in antiphase. The internal soliton energy is always lower than the bottom of the exciton band. This is one of the factors which determine large stability of solitons. (5 refs.)

76861 Intrinsic polaron energy with allowance for dynamic correlations. A.P.Popov.
Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.623-4 (April 1983). In Russian.
To calculate the energy of the polaron ground state with zero full momentum, the author uses a method which is a logical development and extension of the Pekar-Buymistrov method. The calculations lead to energy values of the autolocalized state somewhat lower than those obtained using other calculation methods. (6 refs.) V.G.P.

76862 Electromagnetic wave absorption by an electron-phonon system under parametric resonance. Nguyen Van Trong.
Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.760-7 (May 1983). In Russian.
A quantum kinetic equation is considered for an electron-phonon system exposed to an external radiation field under conditions of parametric resonance decay. The collision term obtained is used to calculate the dissipative conductivity. With the external field intensity being close to the threshold value corresponding to the parametric instability, the conductivity is shown to have a logarithmic singularity. (8 refs.)

71.45 COLLECTIVE EFFECTS

76863 X-ray scattering study of 2k_F and 4k_F CDW in TMTTF-TCNQ. S.Kagoshima, J.P.Pouget (Lab. de Phys. des Solides, Univ. Paris Sud, Orsay, France), H.Anzai.
J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1629-34 (May 1983).
In the organic one-dimensional conductor TMTTF-TCNQ, the 2k_F and the 4k_F CDW were found by the diffuse X-ray photographic method. The 2k_F CDW condenses at 36K, at which the metal-insulator transition occurs, and forms three-dimensionally ordered structures indicating the occurrence of the Peierls transition. A different and unusual temperature dependence is shown by the 4k_F CDW. The transverse ordering of CDW is easily destroyed by the X-ray irradiation. Observed wave number of the transverse ordering and the strong irradiation effect suggest that the 2k_F CDW grows on both TCNQ and TMTTF stacks. However the 4k_F CDW is expected to be present mostly on the TMTTF stack.

76864 Electron localization in a two-dimensional system in strong magnetic fields. I. Case of short-range scatterers. T.Ando (Inst. of Appl. Phys., Univ. of Tsukuba, Ibaraki, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1740-9 (May 1983).
A computer simulation is performed to study localization of a two-dimensional electron system in strong magnetic fields. Scatterers with short-range δ -potentials are assumed, and the localization criterion based on the Thouless number $g(L)$ is employed. It is shown that states are localized exponentially except in the vicinity of the center of each Landau level. The decay rate of the localized wave function, i.e. the inverse localization length, approaches zero smoothly at the center. This suggests that only the states just at the center of the Landau level are not localized and all the other states are exponentially localized, although the localization length is extremely large near the center. The energy range where the localization length is extremely large becomes wider with the Landau level index. (28 refs.)

76865 Perturbation theoretical investigation of electron correlation effects in infinite metallic and semiconducting polymers. S.Suhai (Lehrstuhl fur Theoretische Chem., Friedrich-Alexander-Univ. Erlangen-Nurnberg, Erlangen, Germany).
Int. J. Quantum Chem. (USA), vol.23, no.4, p.1239-56 (April 1983).
Moller-Plesset-type perturbation theory is applied to calculate electron correlation effects in infinite, periodic, metallic, and semiconducting polymers. Different possible choices of the zeroth-order Hamiltonian (symmetry adapted Hartree-Fock, spin-, and charge-density waves), the influence of the size of the atomic basis sets, lattice and conduction band sums are investigated. In the case of semiconducting systems a very efficient version of the method using optimally localized Wannier functions has been worked out. Applications include model calculations for infinite atomic hydrogen chains, the investigation of the role of correlation effects in the bond alternation and metal-insulator phase transition in polyene, different one- and many-particle effects contributing to the single-particle gap in polyene, and the calculation of correlated quasiparticle band structures using the electronic polaron model. (23 refs.)

76866 De-correlation technique for separation of Drude parameters from wavelength modulation spectroscopy data. M.Burd, R.Stearns, R.Braunstein (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Status Solidi b (Germany), vol.117, no.1, p.101-7 (1 May 1983).
Separation of bound- and free-electron contributions to the dielectric function is necessary for an accurate analysis of interband transitions. A technique for doing this separation which does not require low energy data is presented. The technique makes use of the fact that the functions which describe the contributions of each part are sufficiently uncorrelated, allowing the construction of a correlation function which uses the Drude effective mass and Drude relaxation time as adjustable parameters. The technique is shown to properly separate a test function and to yield reasonable results from experimental data. (22 refs.)

76867 Inverse dielectric function for a semi-infinite solid. F.Bechstedt, R.Enderlein, D.Reichardt (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany).

Phys. Status Solidi b (Germany), vol.117, no.1, p.261-70 (1 May 1983).

An old problem is addressed here: the description of the dielectric response of electrons near the surface of an infinite half space to perturbing potentials and external charges. Taking into account spatial dispersion, expressions are derived for the screened potential and the inverse dielectric function within the approximation of specular electron reflection. The expressions generalize former results in a way that spatial symmetries of the problem are properly reflected. The boundary conditions are shown to follow from the definition of the screened potential. The inverse dielectric function obtained in the treatment fulfils the orthogonality relation to the dielectric function and the f -sum rule. (20 refs.)

71.45J Fermi-Thomas model

76868 Correlation correction to the Thomas-Fermi-Dirac statistical model of condensed matter. K.Ebina, T.Nakamura (Dept. of Material Phys., Osaka Univ., Toyonaka, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1658-64 (May 1983).

Effect of the correlation energy on the Thomas-Fermi-Dirac statistical model of condensed matter is studied systematically by means of a perturbation method. The pressure curves are obtained with main interest in the low pressure region where the correlation effect is appreciable. The instability of the statistical model occurring at a certain negative pressure is discussed in connection with the thermodynamical stability of electron gas in the outermost region of the Wigner-Seitz sphere; and with the binding problem for an aggregate of atoms at zero pressure.

71.50 LOCALIZED SINGLE-PARTICLE ELECTRONIC STATES

(exc. impurities; for localisation in disordered structures, see 71.55J)

76870 Local partial DOS and experimental Al K spectra of transition metal aluminides. Charge transfer trend. C.Muller (Sektion Phys., Tech. Univ. Dresden, Dresden, Germany), W.Blau, P.Ziesche.

Phys. Status Solidi b (Germany), vol.116, no.2, p.561-73 (1 April 1983).

For the B2-type compounds VAl, CrAl, MnAl, FeAl, CoAl, and NiAl the local partial DOS (densities of states) and the corresponding integrated DOS are determined on the basis of a linear KKR method. The calculated local partial DOS are directly compared to experimental SXE (soft X-ray emission)-spectra. The integrated local partial DOS provide the valence charge distributions per unit cell. The latter are used to estimate the charge transfer in the intermetallic compounds. The calculated results are in good agreement with the experimental observed trend. (28 refs.)

76871 Quantum localization in one-dimensional quasi-random systems and magnetic breakdown. A.A.Slutskin, L.Yu.Gorelik (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).

Solid State Commun. (USA), vol.46, no.8, p.601-3 (May 1983).

The magnetic breakdown in metals is shown to cause the appearance of a new class of one-dimensional quasi-random 'incommensurable' systems where the electrons are localized due to quantum interference effects. At this time both absolute localization and phase transition of 'metal-dielectric' type can be realized. (5 refs.)

76872 Multichannel localization and magnetic impurities. O.N.Dorokhov (L.D. Landau Inst. for Theoretical Phys., Acad. of Sci., Moscow, USSR).

Solid State Commun. (USA), vol.46, no.8, p.605-8 (May 1983).

The behaviour of an electron in N -coupled conducting chains of length L is studied in the presence of magnetic impurities. The electron flow can be

expanded in an orthonormal set of $2N$ channels. Each channel has its own transmission coefficient $T_n(L)$. Spontaneous breaking of the symmetry between channels results in $2N$ different exponential dependences $T_n(L) \sim \exp(-L/l_n^*)$ where l_n^* is a localization length in the n th channel. Low frequency kinetic behaviour depends on the channel with the maximum localization length l_0^* . (16 refs.)

76873 Asymptotic behavior of the density of states of electrons interacting with critical fluctuations of the order parameter. M.I.Auslender, M.I.Katnelson (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.562-4 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.601-4 (July 1982). [received: April 1983]

The interaction of an electron with fluctuations of the order parameter (in magnetic semiconductors, solid and liquid solutions, liquid helium, etc.) may significantly alter the character of its motion, leading to the occurrence of self-localized states. In studying the self-localization of a single electron it is necessary to estimate its averaged partition function $Z(\beta) = (\text{Tr} \exp(-\beta H))$, where H is the Hamiltonian of the electron in the field ϕ of the fluctuations β is the temperature, and $\langle \dots \rangle$ denotes the operation of averaging over the ensemble of fluctuations. (10 refs.)

76874 Ordering of localized electron pairs in crystals with varying valency. L.A.Manakova, S.P.Ionov (Inst. of Physiologically Active Substances, Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.7, p.568-70 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.611-14 (July 1982). [received: April 1983]

Results of the analysis of various types of ordering of localized electron pairs (defined by Anderson as bipolarons) are given in terms of interaction parameters and the electron concentration. An important aspect of the work is that it takes into account the fact that the degree of lattice polarization due to the bipolaron-phonon interaction is related to the parameters of the ground state of the crystal in a self-consistent manner. (14 refs.)

76875 Localized centers in bismuth silicate crystals. M.G.Ermakov, A.V.Khomich, P.I.Perov, I.A.Gorn, V.V.Kucha (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR).

Sov. Microelectron. (USA), vol.11, no.5, p.250-4 (Sept.-Oct. 1982). Translation of: *Mikroelektronika (USSR)*, vol.11, no.5, p.424-9 (Sept.-Oct. 1982). [received: May 1983]

Bismuth silicate ($\text{Bi}_2\text{SiO}_{20}$) crystals, due to their electrooptic, piezoelectric, and elastooptic effects, have found broad application in quantum electronic and optoelectronic structures such as modulators, deflectors, spatial modulators, image converters, holographic memories, etc. The functioning of all of these structures is greatly affected by the presence of localized states in the forbidden band which influence the optical, electrical, and photoelectric properties of the crystals. In order to investigate the localized states the authors have measured the photoconductivity, EPR, and photo-EPR spectra in an electric field, the spectrum of the additional absorption of undoped $\text{Bi}_2\text{SiO}_{20}$ crystals due to the photochromic effect, and the photoconductivity and EPR spectra of bismuth silicate doped with aluminum and gallium (the Al_2O_3 and Ga_2O_3 doping in the melt was up to 0.5 wt.%). 71.55 IMPURITY AND DEFECT LEVELS

76876 High temperature annealing defects of high resistivity Si doped by neutron transmutation. Wu Shuxiang, Yan Maoxun, Hua Zhongli, Zhang Yufeng, Du Yongchang (Dept. of Phys., Peking Univ., Peking, China).

Acta Sci. Nat. Univ. Pekin. (China), no.6, p.62-6 (1982). In Chinese.

Neutron transmutation doped silicon was studied with DLTS. After annealing in nitrogen at 850°C , three deep levels were found in the gap located at 0.2 eV, 0.23 eV and 0.49 eV respectively below the conduction band. It is suggested that they are related to the complex consisting of neutron irradiation damage and quenched-in defects, excited impurities, and the complex of excited impurities and defects of neutron irradiation, respectively. (7 refs.)

76877 Clustered hydrogenic centers in impure semiconductors. K.A.Chao, K.-F.Berggren (Dept. of Phys. & Measurement Technol., Univ. of Linköping, Linköping, Sweden).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1155-63 (April 1983).

Doped semiconductors with shallow impurities provide an ideal situation to study a collection of hydrogenlike atoms under controllable experimental conditions. The authors present the results of recent cluster calculation of the electronic properties of such systems. (19 refs.)

76878 Defects induced by electron irradiation in InP. J.Suski, J.C.Bourgoin (Groupe de Phys. des Solides, Univ. Paris VII, Paris, France), H.Lim.

J. Appl. Phys. (USA), vol.54, no.5, p.2852-4 (May 1983).

Schottky diodes made on n -type InP, containing $2 \times 10^{16} \text{ cm}^{-3}$ free carriers, have been irradiated at room temperature with $\sim 1 \text{ MeV}$ electrons. Using transient capacitance techniques, three electron traps situated at 0.14, 0.24, and 0.41 eV below the conduction band have been detected. Measurement of their introduction rates and comparison with the carrier removal rate measured at 80K indicate that these traps represent $\sim 20\%$ of the electrically active defects created by the irradiation. The capture cross section for electrons of the trap at $E_c - 0.24 \text{ eV}$ is $3 \times 10^{-20} \text{ cm}^2$. (8 refs.)

76879 Magnetic impurities in semiconductors. S.Fukuchi, Y.Kayanuma (Dept. of Phys., Tohoku Univ., Sendai, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1682-6 (May 1983).

The magnetic-nonmagnetic transition of impurities in semiconductors is studied by a simple one-dimensional model. The model is a two-electron system in a linear chain with a short-range impurity potential v . The intra-site two-body repulsive energy U is assumed throughout the crystal. The phase boundary for the transition is calculated numerically exactly by the use of the Green's function formalism. In contrast with the model of Mattis and Lieb, the singlet ground state becomes degenerate with the lowest one-electron scattering state (magnetic) for practically all value of v as U exceeds a critical value U_c which is of the same order of magnitude as v .

76880 Stability of oxygen impurity in silicon and gallium phosphide. M.Jaros (Dept. of Theoretical Phys., Newcastle upon Tyne Univ., Newcastle upon Tyne, England). *J. Phys. C (GB)*, vol.16, no.14, p.1459-63 (20 May 1983). It is argued that the stable positions of the oxygen impurity in the lattice of silicon and gallium phosphide can be explained in terms of a simple first-order mechanism, without invoking a second-order process known as the pseudo Jahn-Teller effect. (10 refs.)

76881 Energy levels of an electron bound on a donor-acceptor pair. B.L.Gel'mont (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.10, p.443-5 (20 Nov. 1982). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.365-7 (20 Nov. 1982). [received: June 1983] The problem of the dependence of the binding energy of an electron in a donor-acceptor pair on the distance R between the donor and acceptor is examined. It is shown that the critical distance R_c is an essential singularity at which an infinite number of levels converge. (3 refs.)

76882 Electron bombardment induced defect states in p-InP. M.Levinson, H.Temkin, W.A.Bonner (Bell Labs., Murray Hill, NJ, USA). *J. Electron. Mater.* (USA), vol.12, no.2, p.423-32 (March 1983). A deep level transient spectroscopy (DLTS) study has been made of 1 MeV electron bombardment induced defect states in the lower half band gap of EC grown Zn doped p-InP. One state was observed in the unirradiated material with a hole emission activation energy H of 0.15 eV. Irradiation resulted in two new states with H of 0.34 and 0.58 eV, and introduction rates $dN_i/d\phi$ of 1 and 0.04 cm^{-2} , respectively. Annealing experiments revealed the appearance of an additional state with H (0.52 eV), and recovery of the 0.34 eV defect state above 150°C. The 0.52 eV and 0.58 eV states were found at the highest concentration near the metal-semiconductor interface. The implications of the large introduction rate of the 0.34 eV state are discussed. (17 refs.)

76883 Residual donors and acceptors in high-purity GaAs and InP grown by hydride VPE. B.J.Skromme, T.S.Low, T.J.Roth, G.E.Stillman (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA), J.K.Kennedy, J.K.Abrokwhah. *J. Electron. Mater.* (USA), vol.12, no.2, p.433-57 (March 1983). Residual donors and acceptors in epitaxial films of GaAs and InP grown by the hydride vapor phase epitaxy technique were investigated using the complementary techniques of photothermal ionization spectroscopy and variable-temperature photoluminescence. High-purity samples of GaAs grown in three different laboratories were compared and high-purity InP samples were also measured. The dominant shallow acceptors in the GaAs samples were found to be C and Zn, and deep Cu and Mn acceptors were also observed. The donors Si, S, and Ge were observed in the GaAs with S being dominant. A clear correlation was observed between the gas phase stoichiometry during growth and the relative incorporation of column IV donors (Si and Ge) and column VI donors (S) in GaAs. Substrate quality, source purity, and atmospheric contamination of the growth system were found to influence the photoluminescence spectra of the GaAs samples. (41 refs.)

76884 Theory of interimpurity transitions in condensed medium. L.N.Christophorov, V.N.Kharkyanen (Inst. of Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.415-25 (1 April 1983). The problem investigated is the quantum particle transfer between impurities imbedded in a condensed medium via the states of the latter. The kinetic equation explicitly containing no medium indices (the role of the medium is taken into account by effective constants found from 'free' medium properties) is obtained. The two-impurity case (donor-acceptor transfer) is considered in detail for a one-dimensional model of a crystal. (18 refs.)

76885 Comparison of different approaches to the study of local defects in crystals. II. Substitutional impurities in the tight-binding approximation. C.Pisani, R.Dovesi, P.Ugliengo (Inst. of Theoretical Chem., Univ. of Turin, Turin, Italy). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.547-56 (1 April 1983). Different approaches to the study of local defects in perfect crystals are compared as applied to the classical problem of substitutional impurities in tight binding (TB) cubic metals. The standard embedding procedure proposed by Koster and Slater (KS) is perfectly suited for this problem and its results are taken as a reference. It is thus possible to evaluate the performance of isolated cluster (IC) calculations, and of those 'perturbed cluster' approaches which correct the cluster molecular solution by a suitable coupling operator (MLEC schemes). It is shown that while IC results are affected by enormous relative errors at small perturbations even with large clusters, the MLEC approach is very effective in accounting for the presence of the surrounding media and reproducing the correct electronic structure within the cluster. (14 refs.)

76886 Energy levels and binding energy of ion pairs in Si. H.Lemke (Zentralinst. für Elektronenphys., Akad. der Wissenschaften, Berlin, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.223-34 (16 March 1983). In German. The energy levels of the ion pairs between the acceptor Ga and the donors Fe, Mn, Cr are investigated by DLTS- and TSCA-techniques. The donor levels and capture coefficients for holes lie at $E_d+0.24\text{ eV}$, $E_d-0.36\text{ eV}$, $E_d+0.47\text{ eV}$ and $r_p=4\times10^{-8}$ ($T=120\text{K}$), 1×10^{-11} (90K), $2\times10^{-8}\text{ cm}^2\text{ s}^{-1}$ (240K) for FeGa, MnGa, CrGa. The binding energies for all neutral ion pairs between B, Al, Ga and Fe, Mn, Cr are determined. These energies lie between 0.3 and 0.7 eV and show a 'chemical shift' with both pairing atoms. Between the acceptor energy E_A , the energy E^{++} of the 'free' double charged donor and the donor energy E^{++}_p of the pair there exist an approximation $E^{++}_p \approx E^{++} + aE_A$ with $a=5$ (Fe), 6.5 (Mn), and 8 for Cr. In the case of Fe and Cr the level E^{++} must lie in the valence band ($\approx E_v-0.15\text{ eV}$). (11 refs.)

76887 The electronic structure of F-centres in alkali halide crystals. Z.S.Herman (Quantum Chem. Group, Univ. of Uppsala, Uppsala, Sweden), G.Barnett. *Rev. Bras. Fis. (Brazil)*, vol.12, p.73-91 (March 1982). [received: April 1983] A method is presented for estimating the number of bound states of different orbital angular momentum quantum number for an F-centre residing in an alkali halide crystal through the introduction of a spherically symmetric potential well of finite depth. The method is illustrated through its application to the F-centre in sodium chloride, and the results for F-centres in various alkali halide lattices are tabulated. The results provide a good account of the experimental features of the F-centre including the K-band which, it is suggested, is due to transitions from the $2p$ to excited levels. Values for the effective range of penetration of the defect electron with the neighbouring cation in different crystals are determined by requiring that the well depth be independent of orbital angular momentum quantum number. The technique is applied to estimate the Madelung constant and Madelung potential for the host crystals. (no refs.)

76888 Electronic structure of thallous centres and $\text{Ti}^{++}-\text{V}_k$ recombination in KCl crystal. E.Kotomin, A.Shluger, I.Tale (Latvian State Univ., Riga, Latvian SSR). *Solid State Commun. (USA)*, vol.46, no.8, p.625-9 (May 1983). Parameters of impurity Ti^{++} ion required for the calculation of different thallous centres in alkali halides are obtained for the semiempirical method of the intermediate neglect of differential overlap (INDO). The electronic structure of Ti^{++} , Ti^{++} , $(\text{Ti}_2)^{3+}$ centres in KCl is calculated. The potential energy curves for the recombination of nearest Ti^{++} , V_k centres against the breathing vibrational mode of the V_k centre are calculated. This recombination (hole trapping) is found to be nonradiative tunneling with small activation energy. Experimental data is also discussed in the light of the present calculations. (40 refs.)

76889 Microscopic model of the EL2 level in GaAs. J.Lagowski, M.Kaminska, J.M.Parsey, H.C.Gatos, W.Walukiewicz (MIT, Cambridge, MA, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.41-8. It was found that the defect responsible for the dominant deep donor $E_c-0.76\text{ eV}$ (EL2) in melt-grown GaAs also introduces a shallow donor level at $E_c-0.025\text{ eV}$. This finding makes possible the refinement of the authors' antisite defect As_{Ga} model of the EL2 formation in melt growth to a microscopic model which accounts for the, thus far, observed electronic behavior of EL2 (including its metastable state). In addition to the antisite defect As_{Ga} , the proposed defect center involves an arsenic vacancy V_{As} on a neighboring site. This complex is similar to a DX center exhibiting a large lattice relaxation energy. (24 refs.)

76890 Interactions among certain deep-level traps in GaAs. Zou Yuanxi, Zhou Jicheng, Mo Peigen, Lu Fengzheng, Li Liansheng, Shao Juan, Hong Lei (Shanghai Inst. of Metall., Acad. Sinica, Shanghai, China), Sun Henghui, Sheng Chi, Sun Qing. Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.49-56. The interactions among certain defects in GaAs including the deep levels A, B, C and EL2 as well as certain shallow donors are discussed on the basis of DLTS measurements on VPE and LPE grown bulk GaAs. The model proposed previously by one of the authors (Zou, 1974) to account for two predicted unknown acceptors in GaAs, which are expected to be equal in concentration but different in nature just like the A and B hole traps reported later by Lang and Logan (1975), is elaborated in the light of the present findings. (31 refs.)

76891 Thermal conversion of undoped GaAs and the outdiffusion of the main electron trap EL2. B.Hughes, C.Li (Santa Rosa Technol. Center, Hewlett-Packard, Santa Rosa, CA, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.57-64. The deep level donor EL2 compensates acceptors making undoped GaAs grown by the low-pressure LEC technique semi-insulating. Hall effect measurements vs. temperature were used to substantiate this model. The concentration of electrically active EL2 in the layer near the surface decreased during annealing at 850°C in a hydrogen atmosphere. The observed p-type thermal conversion of undoped semi-insulating GaAs is caused by the decrease in the EL2 concentration. EL2 did not decrease, however, during annealing in a nitrogen atmosphere; this suggests that the apparent EL2 loss is associated with indiffusion of hydrogen. (19 refs.)

76892 Re-examination of the mid-gap electron trap (EL2) in different GaAs wafers by photocapacitance, DLTS and photoluminescence spectra. M.Taniguchi, T.Ikoma (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.65-70. Using DLTS, photocapacitance, and photoluminescence methods, the authors re-examined a mid-gap electron trap (EL2) in variously grown GaAs wafers; some were ion-implanted (O, As, Ga, Si and N) and annealed. All the samples contained EL2 as a major electron trap. From these results, a new mid-gap electron trap (EL2-O) was distinguished from EL2, which has the same emission rate but different photoionization energies. Results also suggest that the 0.64 eV PL band is not related to EL2 but to an oxygen-induced level. (16 refs.)

76893 Dependence of emission-capture properties of dominant traps and interface states on alloying in organometallic VPE $\text{Al}_x\text{Ga}_{1-x}\text{As}$. T.Matsumoto, P.K.Bhattacharya, J.Darmawan (Dept. of Electrical & Computer Engng., Oregon State Univ., Corvallis, OR, USA), M.J.Ludowise. Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.289-96. Thermal emission and capture and photoionization properties of three dominant electron traps in organometallic VPE $\text{Al}_x\text{Ga}_{1-x}\text{As}$ have been investigated. Some of the trends have been explained by a configuration coordinate model. New deep levels are not observed at the grown GaAs/ $\text{Al}_x\text{Ga}_{1-x}\text{As}$ heterointerface. Evidence is shown of transfer doping phenomena at the $\text{Al}_x\text{Ga}_{1-x}\text{As}$ -GaAs:Cr substrate interface for $x\geq 0.4$. (30 refs.)

76894 Behavior of shallow acceptors following neutron transmutation doping. A.T.Hunter, M.H.Young, R.Baron, J.P.Baukus, O.J.Marsh (Hughes Res. Lab., Malibu, CA, USA). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.509-14. Neutron transmutation doping of p-type liquid encapsulated Czochralski (LEC) GaAs has been carried out. The concentrations of C, an 0.7 eV level, and an 0.2 eV level present in the starting material remain unchanged. All of the added Se is expected to incorporate as a donor. Approximately 50% of the added Ge is incorporated as an acceptor for samples with 1.5 and $3.4\times10^{15}\text{ cm}^{-3}$ added Ge. These studies confirm the authors' estimates of the activation energy of the 0.07 eV acceptor, as well as the total concentration of acceptors in the original material. (5 refs.)

- 76895 Deep levels in InP grown by SSD method.** C.H.Chung, S.K.Noh, S.C.Park, C.K.Kim (Dept. of Phys., Yonsei Univ., Seoul, Korea). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.641-6.
- Six electron traps have been observed in InP bulk crystals by deep-level transient spectroscopy and photoluminescence measurements. The crystals were grown by the SSD (synthesis by solute diffusion) method. Three deep impurity levels induced by low-temperature heat treatment ($\leq 500^\circ\text{C}$) have the same activation energies of 0.43 eV but somewhat different cross sections. The origin of these deep impurity levels may be due to a specific complex which includes P vacancies and defects. (10 refs.)

71.55J Localization in disordered structures

- 76896 Measurement of deep levels in hydrogenated amorphous silicon by transient voltage spectroscopy.** N.M.Johnson (Xerox Palo Alto Res. Center, Palo Alto, CA, USA). *Appl. Phys. Lett. (USA)*, vol.42, no.11, p.981-3 (1 June 1983).
- Electronic defect levels in amorphous silicon Schottky diodes have been measured by capacitance transient spectroscopy performed in the constant capacitance mode. In hydrogenated amorphous silicon deep levels are continuously distributed in energy and of sufficient density to dominate the electrical properties. The constant capacitance mode, applied for the first time to an amorphous semiconductor, offers significant advantages over the transient capacitance mode for measuring the bulk density of gap states. For example, numerical solution of Poisson's equation for only the steady-state charge distribution is required to analyze the transient response of a diode after a trap-filling voltage pulse. The technique has been used to record time-resolved transients, which saturate with respect to pulse width, and the analysis yields deep level distributions in the range of $10^{17} \text{ eV}^{-1} \text{ cm}^{-3}$ over the energy interval from 0.6 to 0.9 eV below the conduction-band mobility edge. (11 refs.)
- 76897 Defect states and donors in thermally annealed or post-hydrogenated chemically vapor-deposited amorphous Si_3N_4 alloy.** G.Sasaki, S.Fujita, A.Sasaki (Dept. of Electrical Eng., Kyoto Univ., Kyoto, Japan). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2696-700 (May 1983).
- Thermal annealing and post-hydrogenation effects on the electrical properties of chemically vapor-deposited (CVD) amorphous silicon-nitrogen ($\text{a-Si}_3\text{N}_4$) alloys are studied. Annealing of CVD a-Si and a-SiN_x films causes the increases in the ESR centers, the hopping conduction, and the gap-state density evaluated by the field-effect method. The nitrogen incorporation reduces the number of ESR centers in a film. The Fermi level of CVD a-SiN_x films is shifted by post-hydrogenation, which suggests that the films include donors. The $n_{\text{H}}\tau$ products of CVD a-Si and a-SiN_x films are increased by post-hydrogenation, exceeding two orders of the magnitude. Post-hydrogenated CVD a-SiN_x films show larger $n_{\text{H}}\tau$ product than post-hydrogenated CVD a-Si . (30 refs.)
- 76898 On local density of states in Anderson localized systems.** F.J.Ohkawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1710-17 (May 1983).
- The ensemble average of local densities of states defined by $g_2(\epsilon_1, \epsilon_2) = \langle \rho(\epsilon_1, \tau) \rho(\epsilon_2, \tau) \rangle$ is theoretically investigated, where $\rho(\epsilon, \tau)$ is the local density of states of disordered systems. It is shown by using the self-consistent theory due to Vollhardt and Wolfe and a physical picture of localization due to Mott, which includes the effect of 'level repulsion', that $g_2(\epsilon_1 - \epsilon_2)$ is non zero even if the states around ϵ_2 are localized. (14 refs.)

- 76899 Transmission coefficient and the localization length of an electron in N bound disordered chains.** O.N.Dorokhov (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., Chernogolovka, USSR). *JETP Lett. (USA)*, vol.36, no.7, p.318-21 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.7, p.259-62 (5 Oct. 1982). [received: May 1983]
- A model of N-coupled chains with defects for which it is possible to prove rigorously the presence of localization with arbitrarily strong coupling between chains is examined. N different localization lengths arise under these conditions. (8 refs.)
- 76900 Self-consistent study of localisation.** A.Brezini (Internat. Centre for Theoretical Phys., Trieste, Italy), G.Olivier. *Philos. Mag. B (GB)*, vol.47, no.5, p.461-9 (May 1983).
- The localisation models of Abou-Chakra et al. (1973, 1974) and Kumar et al. (1975) are critically re-examined in the limit of weak disorder. By using an improved method of approximation, the displacement of the mobility edge is studied as a function of disorder. The results are compared to other theories in the light of the present approximation. (14 refs.)

- 76901 Analysis of valence-electron structures of $\text{Y}_3\text{Al}_5\text{O}_{12}$ (YAG) and Al_2O_3 , Cr_2O_3 (ruby) - study of certain properties of these laser materials related to their valence-electron structures.** S.H.Yu (Jinan Univ., Changchun, China), L.H.Yu. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.335, p.16-30 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).
- A direct method of determination of the valence-electron structure from its crystal structure has been presented by the writer at XIIth International Congress of Crystallography, at Ottawa, 1981. Here the method is applied to determine the valence-electron structures of $\text{Y}_3\text{Al}_5\text{O}_{12}$ (YAG) and Al_2O_3 , Cr_2O_3 (ruby) to see how certain properties of these laser materials are related to their valence-electron structures. The first point observed is the very strong, continuous, but zig-zag three-dimensional fractional covalent M-O bond nets (M=Al or Cr) being connected with the high melting points, the great resistance against the puncture by the strong laser beam. In the case of Nd-YAG, the distortion caused by the replacement of the Y atoms by almost the same size Nd atoms is small. On the other hand, because of the similarity of the valence-electron structures of $\alpha\text{-Al}_2\text{O}_3$ and Cr_2O_3 , the replacement of Al atoms by the little larger size Cr atoms in small amount is easily understood. The large atomic spins of magnetic moment $m_B = 2.76 \mu_B$ (=experiment value, the theoretical $m_B = 2.70 \mu_B$) of Cr atoms pointing parallel to the c axis of the hexagonal lattice, is found to be due to the direction of the spin situated in the space of lowest density space of the valence-electron cloud distribution. This agrees with the result of $\alpha\text{-Fe}$ disclosed in the paper 'Electron theory of the magnetic moment structures of $\alpha\text{-Fe}$, $\epsilon\text{-Co}$, Ni from neutron diffraction experiments' presented at the Symposium on Neutron Scattering, Argonne National Laboratory, 1981. (20 refs.)

Powder Metall. & Met. Ceram. (USA)*, vol.21, no.10, p.820-3 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.78-82 (Oct. 1982). [received: May 1983]
- A study was made of $\text{Sm}_2\text{M}_{1-x}\text{B}_6$ solid solutions, where M represents ions of di- and trivalent metals, and of metal-deficient Sm_2B_6 phases produced by synthesis. The mixed-configuration state of samarium in SmB_6 is stable and unaffected by defectiveness of structure and the presence of vacancies of metallic states in the lattice. The introduction of atoms of stable integral valence into the SmB_6 crystal lattice alters the valent state of the samarium atoms. The introduction of divalent atoms of atomic radius larger than that of samarium increases the lattice constant of the boride and results in the effective valence gradually growing to the integral value 3. The larger the atomic radius of the addition metal, the lower is the concentration of this addition at which a change in the valence of the samarium atoms is observed. The introduction of trivalent atoms shifts the mixed-configuration state of Sm ions toward smaller values of effective valence, but an integral value is not attained. The effect of substitution of magnetic elements (Eu and Gd) for samarium is the same as that of substitution of nonmagnetic elements (Yb and La). (9 refs.)

| 76905 Energy level diagrams for d^2 - d^8 configurations in a cubic field. Y. Sakunthalamma, K. Purandar, S.V.K. Lakshman (Dept. of Phys., SVU Coll., Tirupati, India). <i>Indian J. Pure & Appl. Phys.</i> , vol.21, no.3, p.190-2 (March 1983). Tanabe-Sugano diagrams are of great help to scientists working on the transition metal ions embedded in crystals in the optical absorption spectra. Since fixing the band positions with Racah parameter (C) involves a great amount of computer work, the cubic field energy matrices for d^2 , d^3 , d^4 , d^5 , d^6 , d^7 , and d^8 electronic configurations are diagonalized. A few typical energy level diagrams drawn between Dq/B and E/B for certain values of C/B are presented. (2 refs.) | |
| 76906 Comparative crystal-field analysis of Eu^{3+} : Y_2O_3 . B.M. Angelov (Dept. of Phys. Chem., Higher Inst. of Food Technol., Plovdiv, Bulgaria). <i>J. Phys. C (GB)</i> , vol.16, no.14, p.1437-9 (20 May 1983). The dependence of the crystal-field parameters for Eu^{3+} : Y_2O_3 upon four sets of radial expectation values $\langle r^n \rangle_{4f}$ has been examined. It is shown that the more extended wavefunctions reproduce better the available experimental data. The europium-oxygen overlap has been calculated and found to give parameters comparable to the experimental ones. The same trend is reflected on the variation of the crystal-field strength evaluated as an average parameter. (17 refs.) | |
| 76907 Anomalous linewidths of the crystal electric field excitations in $\text{La}_{0.997}\text{Tm}_{0.003}\text{Al}_2$ below the superconducting transition. R. Feile, K. Knorr (Inst. fur Phys., Johannes Gutenberg Univ. Mainz, Mainz, Germany), J.K. Kjems, B. Frick, M. Loewenhaupt. <i>J. Phys. C (GB)</i> , vol.16, no.14, p.1465-9 (20 May 1983). Inelastic neutron scattering experiments on $\text{La}_{0.997}\text{Tm}_{0.003}\text{Al}_2$ show an inelastic electric field transition at 0.75 meV. The width of this transition decreases monotonically in the temperature range from 9.5K down to the superconducting temperature at $T_c = 3.15\text{K}$. Below T_c a sudden decrease of the linewidth is observed levelling off at a finite value between 2.5K and 60 mK. (14 refs.) | |
| 76908 A quantum field theoretic approach to the calculation of reduction factors in Jahn-Teller systems. I. General theory. S.H. Payne, G.E. Stedman (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand). <i>J. Phys. C (GB)</i> , vol.16, no.14, p.2679-703 (20 May 1983). Ham reduction factors are defined in the context of a field theoretic formalism and are thus generalised to cover arbitrary choices of electronic states, linear and nonlinear ion-lattice couplings, anharmonic lattice interactions, the mixing of electronic levels, second- and higher-order reduction factors and notably the effect of temperature in populating a distribution of vibronic states. Symmetry considerations are integrated with the field theoretic formalism in diagram form. Calculational techniques are described in some detail. Comparison is made with a similar generalisation of the standard definition of the reduction factor, which however implies the choice of particular vibronic states and does not include the effects of finite temperature. Symmetry considerations allow the first-order reduction factor to be written as a sum of products of $6j$ symbols (of the relevant symmetry group) and physical parameters. This in turn prescribes the form of sum rules linking the reduction factors in some approximation. The most important sum rules are exact at second order if the ion-lattice interaction contains only time-even operators. As a concrete illustration of the results, a simple tetragonal example is analysed in some detail. (21 refs.) | |
| 76909 A quantum field theoretic approach to the calculation of reduction factors in Jahn-Teller systems. II. $\text{E}_g(2\alpha_1 + e)$ in octahedral symmetry. S.H. Payne, G.E. Stedman (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand). <i>J. Phys. C (GB)</i> , vol.16, no.14, p.2705-23 (20 May 1983). For pt.I see <i>ibid.</i> , vol.16, no.14, p.2679 (1983). The formalism of the preceding paper is applied to doublet levels in octahedral symmetry in interaction with many lattice modes of all frequencies through linear, nonlinear and anharmonic couplings. It is shown explicitly that when non-linear and anharmonic couplings are present, the interaction with symmetric modes (which have been ignored in the Jahn-Teller problem up till now) will contribute to reduction factors. The authors give the constraints upon the topology of any field theoretic diagram for it to contribute to a given reduction factor. These permit the generalisation of some results to all orders of perturbation. Explicit formulae are given for each reduction factor and for all temperatures and all fundamental interactions, up to fourth order and in some cases sixth order of perturbation. For example, at low temperatures the temperature-dependent part of a reduction factor varies as T^2 in second order, while at fourth order it will vary as T^4 , T^5 , T^6 or T^9 depending on whether linear, non-linear or both of these mixed with anharmonic effects are responsible. The conditions under which the sum rule $q = 1/2(1+p)$ breaks down are discussed in detail. For example, it is valid for all linear couplings at all temperatures if only one phonon frequency is chosen (Einstein lattice), while in a realistic (multifrequency) lattice contributions from nonlinear and anharmonic coupling violating the sum rule appear at sixth order. (22 refs.) | |
| 76910 A quantum field theoretic approach to the calculation of reduction factors in Jahn-Teller systems. III. $\text{E}_g(2\alpha_1 + e + \tau_2)$ in octahedral symmetry. S.H. Payne, G.E. Stedman (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand). <i>J. Phys. C (GB)</i> , vol.16, no.14, p.2725-48 (20 May 1983). For pt.II see <i>ibid.</i> , vol.16, no.14, p.2705 (1983). The method and results of the two previous papers are extended to triplet and quartet electronic states in octahedral symmetry. Explicit expressions are given for all reduction factors to fourth order, including nonlinear, anharmonic and symmetric interactions. Sum rules for reduction factors, and the conditions under which they are | |

| | |
|--|-----------------|
| broken, are discussed in detail for each system, in the general coupling case, in the case where one coupling symmetry only is assumed, and in the case of equal coupling. A general proof is given for all Jahn-Teller systems, including tetrahedral and icosahedral systems, that sum rules associated with time-reversal considerations at second order are also valid at fourth order to the case of coupling to isoenergetic modes. For triplet systems weak τ_2 coupling together with nonlinear and anharmonic effects may be expected to have disproportionately large effects by inducing violations of sum rules and by introducing resonant terms. For quartet systems many novel sum rules are discussed. By testing such rules or by measuring the temperature dependence of a reduction factor it is possible in principle to determine whether either coupling symmetry is dominant and whether any of nonlinear, anharmonic and symmetric coupling effects are significant in practice. (29 refs.) | |
| 76911 Crystal-field calculation of the 3d multiplets of the binuclear Ni(II) monothiocarboxylates. J.A. Sordo, F. Gomez Beltran, L. Pueyo (Dept. de Quimica Fisica, Univ. de Oviedo, Oviedo, Spain). <i>J. Solid State Chem. (USA)</i> , vol.47, no.3, p.350-60 (May 1983). The electronic spectra of the dimers $(\text{Ni(R-COS)}_2)_2$ and $(\text{Ni(R-COS)}_2)_2 \cdot \text{C}_2\text{H}_5\text{OH}$ are calculated by crystal-field theory in terms of different polyhedra of coordination around the two Ni^{2+} ions. The necessary radial parameters are taken from other clusters of Ni^{2+} after a detailed study of their intercluster transferability. The calculations are organized in two blocks. In the first one, the Ni^{2+} - Ni^{2+} interaction is neglected and the clusters Ni^{2+} , Ni^{2+}O_4 and Ni^{2+}O_2 are considered. In the second block, this interaction is explicitly taken into account as a point-charge perturbation produced by one of the two metal ions on the 3d states of the other one. Accordingly, we deal with the $\text{Ni}^{2+}\text{Ni}^{2+}$ in which the Ni^{2+} acts as a pointlike ligand of charge q , and with the $\text{Ni}^{2+}\text{O}_4\text{Ni}^{2+}$ and the $\text{Ni}^{2+}\text{O}_2\text{Ni}^{2+}$, where the Ni^{2+} is the punctual ligand. The calculation shows that the optical spectra and magnetic moments of these dimers can be best reproduced if $q \approx 0$, i.e. when the metal-metal electrostatic interaction is negligible. The agreement with the experiments quickly disappears as q grows. This calculation supports the interpretation of Meljón et al. (1970) according to which the 3d electronic distribution of the Ni^{2+} ions in these dimers is probably controlled by their nearest neighbors rather than by the metal-metal interaction. (19 refs.) | |
| 76912 Influence of an impurity ion on the geometry of its immediate environment. V.N. Vasyukov, S.N. Lukin, G.A. Tsintsadze (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR). <i>Sov. Phys.-Solid State (USA)</i> , vol.24, no.11, p.1995-6 (Nov. 1982). <i>Translation of: Fiz. Tverd. Tela (USSR)</i> , vol.24, no.11, p.3501-3 (Nov. 1982). [received: May 1983] Demonstrates the active role of an impurity ion in the formation of the geometry of its immediate environment. A Co^{2+} paramagnetic impurity ion replacing isovalently an ion which does not exhibit orbital degeneracy of the ground state alters the existing trigonal distortion of the octahedral immediate environment. This is a special case of the pseudo-Jahn-Teller effect. (5 refs.) | |

71.70E Spin-orbit coupling, Zeeman, Stark and strain splitting

- 76913 Temperature dependence of the Wannier-Stark level width in a semiconductor in a strong electric field. A.M.Berezhevskii, A.A.Ovchinnikov (L.Ya. Karpov Inst. of Phys. Chem., Moscow, USSR). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.289-99 (1 May 1983). Analytical expressions for the level width of the Wannier-Stark ladder caused by an electron-phonon interaction are derived. They allow to investigate the dependence of the width on temperature, external field, and semiconductor band parameters. It turns out that with increase in temperature the width associated with acoustic phonons is drastically increased whereas the width associated with optical phonons rises much more slowly. It seems that almost all experiments for finding the Wannier-Stark ladder had been carried out at too high temperatures when the interaction of an electron with acoustic phonons eliminates the ladder. 72.00 ELECTRONIC TRANSPORT IN CONDENSED MATTER

(for surfaces, interfaces, and thin films, see 73.)

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982 See Entry 74219

72.10 THEORY OF ELECTRONIC TRANSPORT; SCATTERING MECHANISMS

- 76916 Quantum transport in quasi-one-dimensional systems. V.K.Arora (Dept. of Phys., Univ. of Riyadh, Riyadh, Saudi Arabia), M.Prasad. *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.127-40 (1 May 1983). The results of quantum transport investigations in quasi-one-dimensional systems assumed to be of cylindrical geometry are presented. Quantum size effects become important when the de Broglie wavelength (λ_D) of confined electrons becomes comparable to the radius R_0 of the cylindrical geometry. In the extreme quantum limit, $\lambda_D > R_0$, the resistivity is found to be proportional to λ_D^2/A , where $A = \pi R_0^2$ is the area of cross-section. Similar behavior is found for electrons confined to a strong magnetic field, $\lambda_D \gg \lambda = (\hbar c/eB)^{1/2}$, when $A = \pi \lambda^2$ is the area of the cyclotron orbit or radius λ in a magnetic field of strength B . The quantum-transport behavior of electrons confined in thin wires is found to be analogous to that of electrons confined in a magnetic field. (51 refs.)
- 76917 Phase recurrences and metastability in a one-dimensional solid. C.J.Lambert, P.D.Beale, M.F.Thorpe (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England). *Phys. Rev. B (USA)*, vol.27, no.9, p.5860-3 (1 May 1983). The inverse localization length α (and hence resistance) of a one-dimensional disordered solid can be expressed in terms of a cumulative phase ϵ which obeys a nonlinear finite-difference equation. The authors examine this equation in the limit of zero disorder and obtain an expression for probability distribution $P(\epsilon)$. In the band-gap region, there is a stable fixed point leading to a nonzero α . At discrete points within a band there are metastable attractors with period ≥ 2 which for a small amount of disorder can lead to anomalies in α . (16 refs.)
- 76918 Ballistic passage of current carriers in crystals with a narrow allowed band. A.A.Ignatov (Inst. of Appl. Phys., Acad. of Sci., Gorki, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.619-21 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.859-62 (Aug. 1982). [received: May 1983] Studies the volt-ampere characteristic of a crystal with a narrow allowed band under conditions of ballistic passage of current carriers through the sample ($x \ll v_0\tau$, where x is the thickness of the crystal, τ is the relaxation time of the particle momentum, and v_0 is the characteristic velocity acquired by the particles in the electric field). It is assumed that the current carriers are created in the sample by monopolar injection from one of the contacts (the 'cathode'). This formulation of the problem is fairly realistic in molecular crystals because of their characteristic long relaxation times of the momenta of the current carriers. (10 refs.)

- ## 72.15 ELECTRONIC CONDUCTION IN METALS AND ALLOYS
- 76919 Electron transport and magnetic properties of some mixed-valent alkalthiocuprates. B.P.Ghosh, M.Chaudhury, K.Nag (Dept. of Inorganic Chem., Indian Assoc. for the Cultivation of Sci., Calcutta, India). *J. Solid State Chem. (USA)*, vol.47, no.3, p.307-13 (May 1983). Electrical transport properties of some two-dimensional isostructural compounds KCuS_3 , RbCuS_3 , and CsCuS_3 and a one dimensional conductor $\text{Na}_2\text{Cu}_4\text{S}_4$ have been investigated. Conductivities have been measured on pelletized materials in the temperature range 300 to 150K. All of them behave as metallic conductors. The room temperature conductivities of these compounds are KCuS_3 , $1600 \Omega^{-1} \text{cm}^{-1}$; RbCuS_3 , $1400 \Omega^{-1} \text{cm}^{-1}$; CsCuS_3 , $1250 \Omega^{-1} \text{cm}^{-1}$; $\text{Na}_2\text{Cu}_4\text{S}_4$, $700 \Omega^{-1} \text{cm}^{-1}$. The observed trend in conductivities among the isostructural compounds may be rationalized either on the basis of shortest Cu-Cu distances or on the carrier charge concentrations per unit volume. All of these compounds behave as Pauli paramagnetic materials. (25 refs.)
- ## 72.15C Electrical and thermal conduction in amorphous and liquid metals and alloys
- 76920 Compound-forming effect in the resistivity of liquid Na-Pb alloys. S.Matsunaga, S.Tamaki (Dept. of Phys., Niigata Univ., Niigata, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1725-9 (May 1983). The electrical resistivity of Na-Pb alloys has been measured as a function of temperature and concentration. The curve of the resistivity has a remarkable maximum around the composition of 75 at.%Na. The curve of temperature dependence of the resistivity has also a sharp maximum at 80 at.%Na. From these results and the thermodynamic properties of this system, it is inferred that there forms a grouping of Na_2Pb in liquid Na-Pb alloys. The resistivity isotherm was analysed in terms of compound-forming effect. (14 refs.)
- 76921 The pressure- and temperature dependence of the electrical resistivity of some amorphous Fe-B alloys. G.Fritsch (ZWE Phys., Hochschule der Bundeswehr Munchen, Neubiberg, Germany), J.Willer, H.Schink, A.Wildermuth, E.Luscher. *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.30-8 (May 1983). Reports measurements of the electrical resistivity of the amorphous alloys $\text{Fe}_{40}\text{Ni}_{40}\text{P}_{14}\text{B}_6$ (Metglas 2826), $\text{Fe}_{32}\text{Ni}_{36}\text{Cr}_{14}\text{P}_{12}\text{B}_6$ (Metglas 2826A), $\text{Fe}_{80}\text{B}_{20}$ (Metglas 2605) and $\text{Fe}_{75}\text{B}_{25}$ as a function of pressure and temperature. The pressure is varied between 0 and 12 GPa, the temperature between 1.2 and 380K. At low temperatures the pressure dependence yields additional information on the scattering mechanism. (26 refs.)

76922 Thermodynamical and structural properties of amorphous $\text{Fe}_{80}\text{B}_{20}$ and $\text{Fe}_{80}\text{P}_{13}\text{C}_7$ alloys. V.M.Pan, I.Ya.Dekhtyar, M.E.Osinovskii, S.E.Litvin, B.G.Nikitin, M.M.Nishenko, M.P.Voronko (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.197-206 (16 March 1983). Such properties of amorphous $\text{Fe}_{80}\text{B}_{20}$ and $\text{Fe}_{80}\text{P}_{13}\text{C}_7$ alloys as heat capacity and electric resistivity in the temperature range 1.5 to 300K, magnetoresistance in perpendicular and parallel magnetic fields up to $\approx 4.78 \times 10^6$ A/m, magnetization, and the Mossbauer effect at 100 and 300K are investigated. The data obtained are interpreted in terms of the hypothesis of short-range order and weakly-coupled 'paramagnetic' centres in a ferromagnetic matrix. A phenomenological description of magnetoresistance data is given and a correlation with the Mossbauer data is discussed. (17 refs.)

76923 Influence of s-d hybridization on the electrical conductivity of liquid transition metals. V.T.Shvets (Odessa Technol. Inst. of Refrigeration Industry, Odessa, USSR). *Theor. & Math. Phys. (USSR)*, vol.53, no.1, p.1040-6 (Oct. 1982). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.146-55 (Oct. 1982). Retarded Green's functions are used to develop a theory of the electrical conductivity of liquid transition metals with systematic allowance for the hybridization of the s and d state of the conduction electrons. It is shown that the conductivity can be represented as a sum of three terms, one of which is due to the scattering of s electrons by ions, including resonance scattering by d states, the second is due to tunneling of d electrons through d states, and the third is due to transitions of almost localized d electrons to delocalized s states and reverse transitions from s to d states. Expressions for each of the contributions are obtained in the framework of perturbation theory with respect to the pseudopotential of the electron-ion interaction, the hybridization potential, and the resonance integral. (14 refs.)

72.15E Electrical and thermal conduction in crystalline metals and alloys

76924 Low-frequency electrical resistance of iron, cobalt, and nickel in the vicinity of their Curie temperatures. B.C.Sales, M.B.Maple (Inst. for Pure & Appl. Phys. Sci., Univ. of California, San Diego, CA, USA). *Appl. Phys. A (Germany)*, vol.A31, no.2, p.115-17 (June 1983). Alternating-current electrical resistance measurements between 17 Hz and 100 kHz were made on high purity Fe, Co, and Ni wires in the vicinity of their Curie temperatures (T_c). The electrical resistance was independent of frequency for temperatures (T) above T_c . As the temperature was lowered, however, there was an abrupt jump in the electrical resistance at T_c followed by a gradual decrease toward its DC value. The magnitude of the electrical resistance jump at T_c increased as the square root of the frequency. The enhancement of the electrical resistance for $T \leq T_c$ is produced by an abrupt decrease of the skin depth at T_c which, in turn, is due to the sudden increase in the initial magnetic permeability at T_c . Measurements of the AC electrical resistance in the vicinity of the Curie temperature of certain ferromagnetic metals can be utilized to 1) accurately determine the Curie temperature using frequencies as low as 17 Hz, and 2) quantitatively determine the initial magnetic permeability as a function of temperature and heat treatment. (2 refs.)

76925 Characteristics of the electrical resistivity of magnetically ordered Pd-base alloys. V.A.Matveev, G.V.Fedorov, N.V.Volkenshtein (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.707-10 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. The electrical resistivity of Pd-Mn alloys with 1.25-10 at.%Mn was investigated in the temperature range 20-300K. The concentration and temperature dependences $\rho(c,T)$ obtained in the range 120-300K showed that $\rho(c,T)$ deviated from linearity in the direction of the temperature axis. The nature of this deviation made it possible to divide the investigated alloys into two groups with the following manganese concentrations $c < 5$ at.% and $c > 5$ at.%; these groups corresponded to a ferromagnetic state and to a spin glass state of Pd-Mn alloys. The behaviour of $\rho(c,T)$ observed in the investigated temperature range is explained on the basis of the s-d scattering model which leads to the conclusion that the transition of Pd-Mn alloys from the ferromagnetic to the spin glass state is accompanied by a change in the energy band structure. (11 refs.) A.T.

76926 Anomalous Hall effect in an antiferromagnetic metal. V.A.Volkov, S.I.Masharov, A.F.Rybalko (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.818-20 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A theoretical study is made of this effect, which is associated with asymmetric scattering of conduction electrons by spin inhomogeneities. The s-d or s-f exchange model is used for the case of a two-sublattice antiferromagnet. The temperature dependence of the anomalous Hall coefficient is considered and its singularities due to antiferromagnetic ordering are discussed. (5 refs.) A.T.

76927 The electrical resistivity of short-range ordered alloys and its temperature dependence. J.Richter, G.Schubert (Wissenschaftsbereich Phys., Hochschule für Verkehrswesen Friedrich List, Dresden, Germany). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.597-605 (1 April 1983). The electrical resistivity R of short-range ordered binary alloys with BCC structure is calculated using the force-force correlation function scheme in the weak-scattering limit. For the description of short-range order for temperatures above the critical temperature, the theory of Clapp and Moss (1966, 1968) is applied yielding the Fourier transform of the Cowley short-range order parameters and their dependences on the interatomic potential, the concentration and the temperature. In AB ordering alloys the short-range order causes a decrease of the resistivity R in comparison with a totally stochastic alloy and a positive temperature coefficient $(1/R) dR/dT$. In clustering alloys the atomic short-range order increases the resistivity and yields negative $(1/R) dR/dT$. This qualitative relation between R and $(1/R) dR/dT$ is in agreement with Mooij's rule (1973). Furthermore, the short-range ordering causes characteristic deviations from the Nordheim behaviour. (29 refs.)

76928 The Lorenz function for aluminium of different chemical purity, neutron irradiated or plastically deformed. H.Misiorek, T.Zakrzewski, J.Rafalowicz (Inst. for Low Temperature & Structure Res., Polish Acad. of Sci., Wrocław, Poland). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K25-6 (16 March 1983). The authors perform thermal and electric conductivity measurements in aluminium samples with chemical purity of 6N, 5N, 4N, and 3N. The samples were investigated in the temperature range 4.2 to 50 K in the non-deformed state, fast neutron irradiated state, and plastically deformed (elongated) state. Neutron irradiated (dose 10^{13} and 10^{16} n/cm²) or plastic deformation (3 to

16%) were performed in liquid N₂. From the results of the measurements they plot a family of L(T) curves for different purity Al. (3 refs.)

72.15G Galvanomagnetic and other magnetotransport effects

76929 Relaxation phenomena in amorphous $\text{Co}_{75-x}\text{Mn}_x\text{B}_{25}$ induced by stress annealing. A.Ehrhardt, R.Kern, U.Gonser (Fachbereich Angewandte Phys., Univ. des Saarlandes, Saarbrücken, Germany). *Appl. Phys. A (Germany)*, vol.A31, no.2, p.93-5 (June 1983). The change of the magnetization direction in amorphous ferromagnets by the application of a magnetic field and a tensile stress is investigated by magnetoresistivity measurements. Attention is focussed on permanently remaining influences on the domain structure induced by stress annealing treatments. To observe any dependence on the sign of the magnetostriction λ_s , the authors investigated the amorphous $\text{Co}_{75-x}\text{Mn}_x\text{B}_{25}$ system where the sign of λ_s changes from negative to positive values with increasing Mn content. Surprisingly the stress-annealed samples showed a similar behavior independent of the sign of the magnetostriction. (8 refs.)

76930 Transverse magnetoresistance of amorphous $\text{Fe}_{40-x}\text{Ni}_{40}\text{Cr}_x\text{B}_{20}$ alloys in magnetic fields up to 20 T. P.Czarnecki (Inst. of Phys., A. Mickiewicz Univ., Poznań, Poland), G.Fritzkowski. *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K93-6 (16 March 1983). Investigates the influence of chromium on the magnetoresistance of amorphous ferromagnetic $\text{Fe}_{40-x}\text{Ni}_{40}\text{Cr}_x\text{B}_{20}$ alloys both in low and strong magnetic fields up to 20 T. (9 refs.)

76931 Anomalies of the Hall coefficient in the region of a negative temperature coefficient of the resistance of disordered Ti-Cr alloys. A.S.Sherbakov, A.F.Prekul, N.V.Volkenshtein (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1982-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3483-5 (Nov. 1982). [received: May 1983] Formation of a pseudogap at the Fermi level of alloys containing only metals is an unusual phenomenon, therefore, there is a natural interest in the behavior of the various physical properties of materials exhibiting a pseudogap near the critical composition x_c . The authors report the results of an investigation of the Hall coefficient of the alloy system $\text{Ti}_{1-x}\text{Cr}_x$ ($0 < x < 15$ at.% Cr), which is a typical representative of the investigated class of alloys (this system is characterized by $x_c \approx 7$ at.% Cr). 76932 Kink deformation of $(\text{TMTSF})_2\text{ClO}_4$ single crystal and its influence on electrical resistivity. T.Ishiguro, T.Ukachi (Electrotech. Lab., Ibaraki, Japan), K.Kato, K.Murata, K.Kajimura, M.Tokumoto, H.Tokumoto, H.Anzai, G.Saito. *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1585-92 (May 1983). Mechanical kinks are formed in a needle crystal of bis (tetramethyltetraselenafulvalenium) perchlorate, $(\text{TMTSF})_2\text{ClO}_4$, by applying stresses. The kink which has definite angle of 18.4° accompanies an antikink with the same angle in the opposite direction. By the X-ray precession photograph, the authors show that the kink is ascribed to the mechanical twinning with the boundary on the (210) plane. The electrical resistivity measurements in a deformed part, lying between the kink and antikink, and in a region including the kink, were carried out. They did not show substantial difference compared with those in the undeformed part. However, the kink which accompanies distortion in a molecular stack is considered to be one of the causes of the resistance jump (stepwise increase in resistance), which is frequently observed during cooling.

76933 Non-linear conductivity of one-dimensional charge density wave. S.E.Burkov, V.L.Pokrovsky (L.D. Landau Inst. for Theoretical Phys., Moscow, USSR). *Solid State Commun. (USA)*, vol.46, no.8, p.609-11 (May 1983). A pure system with one-dimensional CDW placed in a homogeneous electric field is considered. Non-linear effects are found to appear due to motion of a

soliton superstructure. The dependence of the differential conductivity on the electric field is calculated. (8 refs.)

76934 The electronic properties of $[\text{CH}(\text{FeCl}_4)_{0.61}]_x$ Y.W.Park, J.C.Woo, K.H.Yoo, W.K.Han, C.H.Choi (Dept. of Phys., Seoul Nat. Univ., Seoul, Korea), T.Kobayashi, H.Shirakawa. *Solid State Commun. (USA)*, vol.46, no.9, p.731-4 (June 1983). The temperature dependence of DC conductivity, thermopower and electron paramagnetic resonance (EPR) results on $[\text{CH}(\text{FeCl}_4)_{0.61}]_x$ are reported. The DC conductivity and thermopower measurements indicate metallic charge transport along the polyacetylene chain interrupted by the interfibril contact resistances and also 'dragged' primarily by the dopant ions. The initial measurements of EPR show Dysonian lineshape with very broad linewidth ($\Delta H \approx 600$ G at room temperature). The temperature dependence of EPR absorption intensity implies that there exist localized magnetic moments. The observed g value ($g \approx 2.03$) suggests the dopant anion is in a form of $(\text{FeCl}_4)^-$. (22 refs.)

76935 Peierls instability and charge density waves at the surface of a metal with a quasideimensional electron spectrum. O.M.Braun, E.A.Pashitskii (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1893-6 (Nov. 1982). *Translation of: Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3333-8 (Nov. 1982). [received: May 1983] It is shown that a displacive (Peierls) transition at an anisotropic surface of a quasideimensional metal should occur at a higher critical temperature than in the bulk. The existence of an adsorbed layer with an optical spectrum of adatom vibrations facilitates the formation of surface charge density waves. (22 refs.)

76936 Anisotropy of transport properties due to direction-dependent band nonparabolicity. M.Storuder, H.T.Langhammer (Sektion Phys., Martin-Luther-Univ. Halle/Wittenberg, Halle, Germany). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.329-33 (1 May 1983). In addition to two-band conduction or the action of an anisotropic-mixed scattering mechanism a further possibility is proposed for the interpretation of the anisotropy of the Seebeck coefficient, the Hall coefficient, and the Lorenz number of semiconducting crystals with noncubic symmetry. In the band model a nonparabolicity is considered which depends on the crystal direction. For acoustic mode scattering the expected anisotropy of these effects is calculated in dependence on the reduced Fermi level with the nonparabolicity as the parameter. The numerical results show that in contrast to the isotropic nonparabolicity the model used here predicts distinct anisotropies. (13 refs.)

76937 High resistivity in p -type InP by deuteron bombardment. M.W.Focht, B.Schwartz (Bell Labs., Murray Hill, NJ, USA). *Appl. Phys. Lett. (USA)*, vol.42, no.11, p.970-2 (1 June 1983). High resistivity layers have been achieved in p -type InP using deuteron bombardment. A curve of average resistivity versus bombardment dose has been determined for p -type InP with an initial background carrier concentration of $1 \times 10^{18} \text{ cm}^{-3}$. It has been shown that average resistivities of $10^9 \Omega \text{ cm}$ or higher can be attained reproducibly, over a dose range 3×10^{13} – 1×10^{14} deuterons/ cm^2 . (13 refs.)

76938 Some properties of amorphous Si thin films and their application to sensors. I. Power sensor. I.Sugiura, S.Kodato, K.Takahashi, M.Konagai. *Anriutsu Tech. Bull. (Japan)*, no.44, p.93-7 (March 1983). In Japanese. Because an amorphous Si thin film containing a microcrystalline phase has properties of a very high dark-conductivity, a large thermoelectric effect and piezoresistance effect, the film can be used as a new electronic material for thermocouple power sensors. The fabrication process of a device used for measurement of the thermoelectric power of the films is reported. The films were deposited on glass substrate, using $\text{SiF}_4 + \text{H}_2$ gases by a d.c. glow discharge. Experimental results on electrical and thermoelectric properties of the films are presented. They show that the Seebeck coefficient (S) is 150–220 $\mu\text{V/K}$, in the proximity of room temperature. The fabrication process and properties of the power sensor are given. The power sensitivity is 1500 $\mu\text{V/mW}$ and the linearity is better than 1%, when input power is 0.1–10 mW. (8 refs.)

76939 The conductivity and thermoelectric power of amorphous silicon. Chu Juehui, Zhang Guobing, Zhang Tianyi (Peking Univ., Peking, China). *Acta Sci. Nat. Univ. Pekin. (China)*, no.5, p.70-6 (1982). In Chinese. Deals with the measurement of conductivity and thermoelectric power of amorphous silicon in the temperature range from 77 to 470K. Specimens are prepared either by the glow discharge-deposition method (sample 1) or by the vacuum evaporation method (sample 2). The sign of the thermoelectric power S of these two samples are negative throughout the temperature range. Experimental results indicate that the conductivity activation energy of a -Si above 300K are 0.25 eV (sample 1) and 0.62 eV (sample 2) obtained by conductivity temperature dependence. These values are in good agreement with the values obtained directly by thermoelectric power measurement (0.24 eV for sample 1, 0.65 eV for sample 2) in the temperature range. The ranges of localized states ($E_C - E_A$) are equal to 0.09 eV and 0.25 eV, the hopping energy W for sample 1 and sample 2 are respectively 0.01 eV and 0.07 eV. (4 refs.)

76940 Electron transport in sub-micron GaAs channels at 300K. B.R.Na. (Centre of Advanced Study in Radio Phys. & Electronics, Calcutta Univ., Calcutta, India), M.Deb Roy. *Appl. Phys. A (Germany)*, vol.A31, no.2, p.65-70 (June 1983). Transient velocity-field characteristics have been computed for GaAs channels having lengths of 0.1, 0.2, 0.5, 1, and 20 μm for electric fields between 1 and 50 kV/cm at 300K. The results are compared with earlier calculations and the significant features of the computed results are discussed. It is found that the electron motion for all channel lengths and for all fields is significantly affected by collisions. The threshold field for negative differential mobility increases, and the magnitude of the differential mobility decreases with decrease in the length of the sample. The maximum steady-state velocity increases with decrease in the length and may be as high as $5.4 \times 10^7 \text{ cm/s}$ for 0.1 μm samples. (31 refs.)

76941 Electrical resistance of diamond implanted at liquid nitrogen temperature with carbon ions. J.F.Prins (Nuclear Phys. Res. Unit, Univ. of the Witwatersrand, Johannesburg, S Africa). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.3, p.79-82 (1983). Carbon ion implantation of diamond to high fluence, below the temperature at which diamond growth can occur, usually leads to black layers of high conductivity. This study shows that for a low enough temperature of the diamond during implantation, a black layer with high electrical resistance can develop. In particular, carbon ion implantation at liquid nitrogen temperature, leads to an implanted layer with electrical resistance about one million times higher than the resistance obtained for implantation at temperatures above room temperature. (5 refs.)

76942 A direct comparison of LEC GaAs grown using low- and high-pressure techniques. W.M.Duncan, G.H.Westphal, J.B.Sherer (Central Res. Labs., Texas Instruments Inc., Dallas, TX, USA). *IEEE Electron Device Lett. (USA)*, vol.EDL-4, no.6, p.199-201 (June 1983). A direct comparison has been made between the properties and implant behavior of undoped semi-insulating (SI) low- and high-pressure liquid encapsulated Czochralski (LEC) GaAs. Although the properties of high-pressure LEC had previously been well characterized, this is the first detailed study of the quality of low-pressure LEC material. It is shown that both material types are similar in structural quality, purity, and in the characteristics of conducting layers formed by direct ion implantation. Arsenic-rich melts and B_2O_3 with greater than 500-ppm H_2O content are required for obtaining reproducible and stable SI behavior growing from quartz crucibles. (16 refs.)

76943 Electron and hole carrier mobilities for liquid phase epitaxially grown GaP in the temperature range 200–550K. Y.C.Kao, O.Eknoyan (Electrical Engng. Dept., Texas A&M Univ., College Station, TX, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2468-71 (May 1983). Mobility data for GaP in the temperature range 200–550K as a function of impurity concentration are presented. The data were determined from sheet Hall coefficient and resistivity measurements obtained using the van der Pauw method. The results are given for a wide range of concentrations ranging from unintentionally doped to degenerately doped conditions. The maximum values of the electron and hole mobilities at room temperature were found to be 160 and 135 cm^2/Vs , respectively. The observed average temperature dependence of the mobility is $T^{-1.7}$ for electrons and $T^{-2.3}$ for holes. (16 refs.)

76944 The DC resistivity of modified PZT ceramics. Long Wu, Tien-Shou Wu, Chung-Chuang Wei (Res. Inst. of Electronics & Electrical Engng., Nat. Cheng-Kung Univ., Tainan, Taiwan), Hsi-Chuan Liu. *J. Phys. C (GB)*, vol.16, no.14, p.2823-32 (20 May 1983). PZT ceramics with various impurities were prepared by the powder metal-lurgy method, in the temperature range 1150–1350°C. The electrical resistivity of each composition has been studied. Explanations based on the distribution model were given. Within the solubility limit, the impurities can produce A-site vacancies or produce O-site vacancies for the PZT ceramics, depending on the valence and the size of impurity ion. When the A-site vacancy produced was added, it acted as a donor, contributed electrons to the conduction process, and increased the resistivity of ceramics, owing to the p -type electrical conduction of undoped ceramics. But the O-site vacancy produced served as an acceptor, contributed holes to the conduction process and thus decreased the resistivity. (20 refs.)

76945 Ternary mixed valence oxygen deficient K_2NiF_4 type copper oxides. Progressive evolution of a semiconducting state from a semimetallic state in $\text{La}_{2-x}\text{Sr}_x\text{CuO}_{4-x/2-y}$. N.Nguyen, F.Studer, B.Raveau (Lab. de Cristallographie et Chimie du Solide, Univ. de Caen, Caen, France). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.389-400 (1983). In French. Magnetic and electron transport properties of the mixed valence copper oxides $\text{La}_{2-x}\text{Sr}_x\text{CuO}_{4-x/2-y}$ ($0 \leq x \leq 1.20$) have been investigated in the temperature range 120–650K. A progressive evolution of the conductivity from a semiconductor to a semi-metallic behavior, as the amount of trivalent copper increases, has been observed. The positive sign of the Seebeck coefficient and the evolution of the conductivity and magnetic properties have been interpreted. (13 refs.)

76946 Solid state studies on substituted CuCr_2O_4 spinel. K.S.De, J.Ghose, K.S.R.C.Murthy (Dept. of Chem., Indian Inst. of Technol., Kharagpur, India). *J. Solid State Chem. (USA)*, vol.47, no.3, p.264-77 (May 1983). Changes in crystallographic, electrical, and thermal properties of CuCr_2O_4 spinel were investigated by replacing Cu with Mg, i.e. $\text{Cu}_{1-x}\text{Mg}_x\text{Cr}_2\text{O}_4$ and Cr with Al, i.e. $\text{CuCr}_{2-x}\text{Al}_x\text{O}_4$. The tetragonal distortion in CuCr_2O_4 disappeared with 60% replacement of Cu by Mg ($x=0.6$) or 50% replacement of Cr by Al ($x=1.0$). The temperature variation of electrical resistivity for all the tetragonal samples was similar to that of CuCr_2O_4 . The first order, diffusionless phase transition was manifest in the hysteresis loops of $\log \rho$ vs. $1/T$ plots. The resistivity and activation energy for conduction changed sharply near the phase transition composition. With the replacement of Cr by Al, the conduction in CuCr_2O_4 was found to change from p type to n type. The low

thermal stability of the spinel was found to be due to a high concentration of tetrahedral Cu^{2+} ions (>80%) and compressed tetragonal distortion which strains the spinel lattice. This strain is removed by replacing either Cu with Mg or Cr with Al, whereby the spinel becomes stable. (32 refs.)

76947 Preparation and properties of substituted iron tungstates. K.Sieber, H.Leiva, K.Kourtakis, R.Kershaw, K.Dwight, A.Wold (Dept. of Chem., Brown Univ., Providence, RI, USA). *J. Solid State Chem. (USA)*, vol.47, no.3, p.361-7 (May 1983). Polycrystalline samples of members of the systems $\text{Fe}_{2-x}\text{Cr}_x\text{WO}_6$ and $\text{Fe}_{1-x}\text{Mn}_x\text{WO}_4$ were prepared and single crystals of $\text{Fe}_{1-x}\text{Mn}_x\text{WO}_4$ were grown by chemical vapor transport. Their crystallographic parameters and electrical properties were characterized. Fe_2WO_6 crystallizes with the tri- α - PbO_3 structure and is an n-type semiconductor. For $0.3 \leq x \leq 2$, the system $\text{Fe}_{2-x}\text{Cr}_x\text{WO}_6$ crystallizes with the inverse triurilite structure and is nonconducting due to blocking of iron(II)-iron(III) conduction paths by chromium(III). For $0 \leq x \leq 1$, the system $\text{Fe}_{1-x}\text{Mn}_x\text{WO}_4$ crystallizes with the wolframite structure and shows p-type semiconducting behavior. The nature of the variation of resistivity with x of $\text{Fe}_{1-x}\text{Mn}_x\text{WO}_4$ suggests that inter-chain electron transfer may occur in this structure. (15 refs.)

76948 Effect of temperature on the electrical transport properties of p-type polycrystalline indium antimonide. P.C.Mathur, A.K.Shukla, R.P.Sharma, P.K.Goyal (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India). *J. Electron. Mater.* (USA), vol.12, no.2, p.483-506 (March 1983). Measurements of Hall coefficient (R_H), DC conductivity and Hall mobility have been made on p-type polycrystalline indium antimonide in the temperature range ~77-450K. The average size of the grains in the sample was ~0.15 μm . It is found that Hall coefficient in the low temperature range is determined by the carrier concentration in the crystallites and n-type conduction predominates over p-type conduction above room temperature. Conductivity and Hall mobility were found to be thermally activated above 120K while the conduction near liquid nitrogen temperature is predominated by the variable range hopping. The effect of grain boundaries is found to be removed above ~370K. (52 refs.)

76949 Screening of electrostatic fields in crystalline semiconductors by electrons hopping over defects. N.A.Poklonski, V.F.Stelmakh (A.N. Sechenko Sci.-Res. Inst. of Appl. Phys. Problems, Minsk, USSR). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.93-9 (1 May 1983). The expression for the electrostatic field screening length is obtained and it is shown that the effective concentration of electrons hopping via defects is included both into the screening length and electrical conductivity. The ratio of the diffusion coefficient to the drift mobility for hopping electrons is found. (12 refs.)

76950 Effect of heat treatment on the conduction and structure of Ge-Se-Te amorphous alloys. M.M.Hafiz (Dept. of Phys., Assiut Univ., Assiut, Egypt), A.A.Ammar, A.I.Al-Adi, A.Mohamed. *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.319-25 (16 March 1983). The effect of heat treatment on the structure and electrical resistivity of the amorphous alloys of the system $\text{Ge}_{20}\text{Se}_{70-x}\text{Te}_{10-x}$ where $x=15,30$, and 50 is studied. Irreversible resistivity changes are observed after heating above the glass transition temperature accompanied by the appearance of the dendritic Te crystalline phase. The amount of the crystalline phase increases with increasing the annealing temperature. The effect of heat treatment on the structure transformation is investigated using DTA, X-ray, and scanning microscopy. The amorphous to crystalline transformation and its effect on the resistivity is discussed. (23 refs.)

76951 Electrical conduction through anodic oxides on InP. G.Eftekhari, D.de Cogan, B.Tuck (Dept. of Electrical & Electronic Engng., Univ. of Nottingham, Nottingham, England). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.331-6 (16 March 1983). The results of measurements of a.c. and d.c. electrical properties in anodic oxides on n-type indium phosphide are reported. The d.c. current, which is polarity dependent, appears to be due to Schottky emission. The semiconductor surface is inverted at zero bias with a potential of ~0.9 V. An oxide and surface states charge density of 2.2×10^{11} electrons cm^{-2} is measured. The oxide relative permittivity decreases from 14.8 at 400 Hz to 4.5 at 10^6 Hz and the a.c. conductivity has a sublinear dependence on frequency. (16 refs.)

76952 Electrical transport and phase stability in silver iodide-cadmium iodide. J.W.Brightwell, C.N.Buckley, L.S.Miller, B.Ray (Faculty of Appl. Sci., Coventry Polytech., Coventry, England). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.391-9 (16 March 1983). A form of the equilibrium diagram for the system AgI-CdI₂ is proposed on the basis of thermal, X-ray diffractometer, and electrical conductivity data. Only one intermediate equilibrium phase, of composition Ag_2CdI_4 , of tetragonal form with $a_0=6.35$ Å and $c_0=12.7$ Å is apparent; the previously reported hexagonal form of this composition being metastable. Low levels of CdI₂ are found to enhance the formation of the cubic, γ -form, of AgI and to increase the electrical conductivity. For various levels of CdI₂ inclusion in AgI, the principal increase in conductivity occurs in the region of 110°C instead of at 146°C as in pure AgI. (15 refs.)

76953 Isolation characteristics in selectivity O^+ and Cr^+ implanted GaAs. S.Nojima (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K9-12 (16 March 1983). The author reports annealing behavior for isolation resistances in O^+ and Cr^+ implanted GaAs crystals. The isolation resistances between two terminals were measured in the darkness at room temperature. (5 refs.)

76954 Microwave transport properties around the structural phase transition of MnSe. Y.Watanabe, J.Takeuchi, M.Oka (Dept. of Phys., Shimane Univ., Matsue, Japan). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K13-15 (16 March 1983). The authors report the measurement of the microwave (9.4 GHz) resistivities ϕ_m performed around the sharp structural transition in InMnSe. The microwave method, which requires no electrode in resistivity measurements, seems to provide an excellent tool for the investigation around the structural phase changes. Evaluation of ϕ_m was made on the basis of the eddy current loss method, by using a reference specimen to determine the cavity constant. The microwave skin depth estimated for the ϕ_m value obtained below was 0.4 to 1.2 mm, a comparable order of the grain size. They therefore assume that the effect of the boundary layer of coarse grains is small in the present case. (6 refs.)

76955 Dependence of electrical properties in iron-cobalt, iron-zinc ferrites near stoichiometry on firing temperature and atmosphere. B.Gillot, F.Jemmal (Lab. de Recherches sur la Reactivite des Solides, Faculte des Sci., Dijon, France). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.601-8 (16 April 1983). The electrical conductivity and the thermoelectric power of some finely-divided cobalt and zinc ferrites near stoichiometry are studied as a function of firing temperature and atmosphere. It is determined that iron-excess ferrites

obtained at low preparation temperature or firing in vacuum above 600°C are of n-type and of much higher conductivity than iron-deficient ferrites which are obtained by oxidation at 300°C or by firing in air with the development of vacancies on octahedral sites and exhibiting p-type conduction. Abrupt changes in conductivity and energy occur as the stoichiometry varies from an iron deficiency to an iron or zinc excess. (15 refs.)

76956 Effect of free carrier screening on the electron mobility of GaAs: a study by field-effect measurements. R.H.Wallis (Lab. Central de Recherche, Thomson-CSF, Orsay, France). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.756-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). By using a field effect technique, the electron mobility in GaAs at 300K has been studied in two systems where the free electron concentration may be varied over a wide range while the density of ionized impurities is kept constant. These are (a) a thin, almost fully depleted n-type layer on a semi-insulating substrate and (b) a GaAs/Al_{0.3}Ga_{0.7}As modulation doped heterojunction. In both cases the mobility falls by more than a factor of two as the free electron concentration is reduced, due to loss of screening. (7 refs.)

76957 Time-dependent field effect in amorphous chalcogenides. C.Bullock, J.M.Marshall, C.Main (Dept. of Phys., Dundee Coll. of Technol., Dundee, Scotland). *Philos. Mag. B (GB)*, vol.47, no.5, p.L69-75 (May 1983).

Exploratory measurements of the transient decay of the field effect in amorphous films from the system $\text{As}_2\text{Te}_3\text{-As}_2\text{Se}_3$ are reported. The excess current is shown to exhibit a power-law dependence upon time over the range 5-5000 s. The rate of decay increases with increasing temperature for a given composition, and with increasing selenium concentration as the composition is varied. The data are discussed in terms of a mechanism of thermalisation of excess charge carriers with localised states which are distributed over a range of energy. The possibility that the decay of the field effect is related to that of the transient photoconductivity is examined. (9 refs.)

76958 The interpretation of drift mobility experiments on amorphous silicon. W.E.Spear, H.Steemers (Carnegie Lab. of Phys., Univ. of Dundee, Dundee, Scotland). *Philos. Mag. B (GB)*, vol.47, no.5, p.L77-82 (May 1983).

A simple analysis is given of the charge displacements expected in a drift mobility experiment from (a) the carrier generation and (b) the subsequent drift of the excess carriers across the specimen. It is then shown that the features of the observed pulses in experiments on a-Si are in quantitative agreement with the predicted behaviour and show a clear transition between events (a) and (b). On the basis of these and of other results it is concluded that, under the experimental conditions, the main component of the observed displacement is associated with the transit of excess electrons, leading to an extended state mobility of about $10 \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$. These conclusions disagree with the recent work of Silver and coworkers (1982, 1983) and throw considerable doubt on their estimated mobility of $10^3 \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$ for a-Si. 76959 Ballistic transport in GaAs. C.K.Williams, T.H.Glisson, M.A.Littlejohn, J.R.Hauser (Dept. of Electrical Engng., North Carolina State Univ., Raleigh, NC, USA).

IEEE Electron Device Lett. (USA), vol.EDL-4, no.6, p.161-3 (June 1983). Ballistic transport in GaAs has been studied using an ensemble Monte Carlo simulation. Duration and spatial extent of ballistic transport for a hot electron distribution can be defined from such studies. Mean displacement of the ensemble increases quadratically with time for a specified interval. This observation provides a phenomenological definition of ensemble ballistic transport. This phenomenological definition is compared with a theoretical definition based on time at which a significant fraction of an ensemble have experienced at least one collision. From these studies, times and distances are given for which a single-particle ballistic equation and a Langevin equation accurately describe ensemble transport in GaAs. (9 refs.)

76960 Experimental determination of impact ionization coefficients in (100) GaAs. G.E.Bulman, V.M.Robbins, K.F.Brennan, K.Hess, G.E.Stillman (Electrical Engng. Res. Lab., Univ. of Illinois, Urbana, IL, USA).

IEEE Electron Device Lett. (USA), vol.EDL-4, no.6, p.181-5 (June 1983). The room-temperature electron and hole impact ionization coefficients, α and β , respectively, have been determined for (100)-GaAs using photocurrent multiplication measurements on specially fabricated p-n junction devices with active region net donor concentrations from $n=1.1 \times 10^{17}$ to $2.2 \times 10^{15} \text{ cm}^{-3}$. In contrast with many previous reports, the electron impact ionization coefficient is found to be greater than the hole impact ionization coefficient over the entire doping and electric field range studied. The ratio α/β decreases from 2.5 to 1.3 as the electric field is increased from 2.22 to $6.25 \times 10^5 \text{ V/cm}$. These results have been confirmed by avalanche noise measurements with both electron and hole injection on the same devices. (24 refs.)

76961 Effect of oxygen on the electrical properties of β -zinc phthalocyanine single crystals. T.G.Abel-Malik (Dept. of Phys., Univ. of El-Minia, El-Minia, Egypt).

Phys. Status Solidi a (Germany), vol.76, no.2, p.K159-62 (16 April 1983). The author reports measurements of ohmic and space charge limited (SCL) currents in β -zinc phthalocyanine (β -ZnPc) single crystals and determines both depth and concentration of localized levels in crystalline specimens of this material. (7 refs.)

76962 Conductivity of ionic dielectrics under pulsed bombardment by electron and X-ray beams of medium density. D.I.Vaisburd, G.A.Mesyats, V.L.Naminov, E.G.Tavanov (Inst. of High-Current Electronics, Acad. of Sci., Tomsk, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.625-8 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1113-16 (Aug. 1982). [received: May 1983]

To elucidate the mechanism for the conductivity of ionic dielectrics under pulsed bombardment by X-ray and electron beams of medium and high density, one must consider the wide energy range covered by the spectrum of nonequilibrium electrons and holes. The authors examine the region of medium beam densities, where the low-energy conductivity vanishes. The samples are thin wafers of alkali-halide crystals. The experiments show that at medium beam densities the fast conductivity is due in comparable measure to the intracenter, temperature-independent conductivity and the high-energy conductivity, which falls off with temperature with an activation energy equal to the energy of the short-wavelength phonon. The amplitude of the fast component therefore falls off more slowly with temperature than does the high-energy conductivity. (14 refs.)

72.20J Charge carriers: generation, recombination, lifetime, and trapping

76963 Determination of diffusion length of electron beam induced minority carriers in polycrystalline GaAs. O.Paz (General Technol. Div., IBM East Fishkill, Hopewell Junction, NY, USA).

Appl. Phys. Lett. (USA), vol.42, no.11, p.958-60 (1 June 1983). A method of combining Schottky barrier electron beam induced current imaging of grain clusters with quantitative determination of diffusion length is demonstrated. This was achieved by comparing the measured number of collected carriers per incident electron, corrected for backscattered, and secondary electrons to a calculated value. A source function compensated for metal thickness was used. Diffusion lengths were measured in GaAs samples and ranged from $0.2 \mu\text{m}$ for polycrystalline and bulk single crystal material to $7.5 \mu\text{m}$ for chemical vapor deposition grown layers. These values were independently verified through a comparison with quantum efficiency data. (13 refs.)

76964 Electron diffusion lengths in Mn-doped InP. C.-L.Chiang, S.Wagner (Dept. of Electrical Engng. & Computer Sci., Princeton Univ., Princeton, NJ, USA), A.A.Ballman.

Mater. Lett. (Netherlands), vol.1, no.5-6, p.145-7 (April 1983). The minority carrier (electron) diffusion length L_n was measured in Mn-doped p-type single crystals of InP. The surface photovoltage technique on electrolyte/InP diodes was employed. For samples with hole densities p ranging from $4.1 \times 10^{14} \text{ cm}^{-3}$ to $5.3 \times 10^{16} \text{ cm}^{-3}$ (296K), $L_n = 2.20 \times 10^3 / p^{0.45} \mu\text{m}$. L_n does not appear to be affected by the high concentration of neutral Mn. (16 refs.)

76965 Determination of carrier lifetime in Si by optical modulation. D.L.Polla (Honeywell Electro-Optics Operation, Lexington, MA, USA).

IEEE Electron Device Lett. (USA), vol.EDL-4, no.6, p.185-7 (June 1983). A contactless optical modulation technique for the determination of photogenerated carrier lifetime in silicon is presented. The method is based on the measurement of the optically modulated free-carrier absorption in Si at $10.6 \mu\text{m}$. The fractional change in transmitted intensity of a DC below band-gap probe beam (with $\hbar\omega_p < E_g$) due to a modulated pump beam (with $\hbar\omega_p > E_g$) is proportional to the excess carrier lifetime. This optical modulation technique, which is relatively simple, contactless, and nondestructive, may have significant potential as a high-resolution high-sensitivity tool for Si wafer screening, crystal growth studies, and process evaluation. (9 refs.)

76966 Minority-carrier diffusion-length measurement and lifetime in $\text{Pb}_{0.8}\text{Sn}_{0.2}\text{Te}$ and indium-doped PbTe liquid phase epitaxy layers. A.Shahar, M.Oron, A.Zussman (Soreq Nuclear Res. Centre, Yavne, Israel).

J. Appl. Phys. (USA), vol.54, no.5, p.2477-82 (May 1983). Minority carrier diffusion length was measured between 10-110K, using a laser light spot scanning technique in $\text{Pb}_{0.8}\text{Sn}_{0.2}\text{Te}$ and In-doped PbTe layers,

grown by liquid phase epitaxy. A new method for fabricating diodes with a bevelled surface is described. Diffusion lengths L of about 10 and $1 \mu\text{m}$ were measured in $\text{Pb}_{0.8}\text{Sn}_{0.2}\text{Te}$ epilayers grown at 500 and 600°C , respectively. In indium-doped PbTe epilayers, L varies with temperature in the range 0.2 to $1.6 \mu\text{m}$. The measured diffusion length was used with available mobility data to derive the minority-carrier lifetime in these epilayers. Comparison of the experimental results with theory shows that in undoped $\text{Pb}_{0.8}\text{Sn}_{0.2}\text{Te}$, carrier lifetime is dominated by band-to-band radiative and Auger recombination mechanisms, while in In-doped PbTe, recombination takes place via nonradiative centres. The implications of the observed diffusion length and the derived lifetime values on the performance of optoelectronic devices are discussed. (28 refs.)

76967 Effect of reabsorbed recombination radiation on the diffusion length of minority carriers in wide-band-gap semiconductors. Ovon Roos (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2495-8 (May 1983). The integrodifferential equation governing the diffusion of minority carriers under the influence of both recombination by flaws and multiple photon absorption and emission via band-band transitions recently developed by the author is solved by means of a variational principle. It is shown that for bulk material the effect of the reabsorbed recombination radiation (RRR) on carrier diffusion is negligible when the average mean free path of photons is larger than the diffusion length of the carriers. In the opposite case, this is not true and the results previously obtained by a different method are recovered. Applied to GaAs, these findings signify that if the diffusion length L due to flaws or recombination centres possesses a magnitude less than $1 \mu\text{m}$, the effect of the RRR may safely be ignored. But, on the other hand, if L is greater than $1 \mu\text{m}$, there exists an effective diffusion length L_{eff} always larger than L , which is engendered by the RRR and which enhances carrier transport. This enhancement becomes noticeable only at high doping levels. (6 refs.)

76968 Comments on 'Carrier recombination through shallow donor/acceptor levels in heavily doped silicon'. M.S.Tyagi (Dept. of Electrical Engng., Indian Inst. of Technol., Kanpur, India).

J. Appl. Phys. (USA), vol.54, no.5, p.2857-9 (May 1983). For original paper see Hu and Oldham, *Appl. Phys. Lett.*, vol.35, p.636 (1979). Carrier recombination through shallow donor/acceptor levels in heavily doped silicon is analyzed. It is found that the Shockley, Read, and Hall theory of recombination is unable to explain the sharp decrease in lifetime with increasing dopant concentrations. However, trap assisted Auger recombination through these levels satisfactorily explains the observed lifetimes as well as their temperature dependences. (18 refs.)

76969 Electron-beam-induced conduction in fluorinated ethylene propylene copolymer and its acrylonitrile graft copolymer. S.G.Joshi, N.D.Ghate (Nat. Chem. Lab., Poona, India), J.F.Jog, S.J.Walzade, S.V.Bhoraskar.

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.685-97 (May 1983). Electron-beam-induced conductivity (EBIC) studies were carried out on fluorinated ethylene propylene copolymer (FEP) and its acrylonitrile graft copolymer (FEP-g-AN). The current transport parallel to the surface under the influence of an electron beam of medium energy (6-30 keV) is reported. The gain in EBIC is calculated and its characteristic variation as a function of beam energy is studied. Minima in the gain versus energy curves have been obtained around 21 keV for FEP, 12 and 18 keV for FEP-g-AN, and 12 keV for polyacrylonitrile (PAN). This behavior is explained by assuming the existence of electron trapping bands close to the surface, at characteristic distances below the surface of the polymeric film corresponding to the range of incident electrons. Gains of the order of 5, 12, and 30 have been obtained respectively for FEP, FEP-g-AN, and PAN for the maximum energy of incident electrons used. (21 refs.)

76970 Depolarization current in a dielectric with deep trapped charge layers. H.Sodolski (Inst. of Phys., Tech. Univ., Gdansk, Poland).

Phys. Status Solidi a (Germany), vol.76, no.1, p.303-9 (16 March 1983). The depolarization current in a dielectric with two bipolar, immobile charge layers is considered. Using simplifying assumptions, the depolarization current equations in the short-circuited system are obtained. Two cases are considered: the isothermal discharge and the thermally stimulated discharge. The influence of several parameters on the TSD current spectra is examined. The theoretical results and the experimental ρ peak for polyester polymer are compared. (8 refs.)

76971 Transfer mechanisms of nonequilibrium charge carriers in graded band-gap semiconductors. A.I.Basyk, V.F.Kovalenko, G.P.Peka (T.G. Shevchenko State Univ., Kiev, Ukrainian SSR).

Phys. Status Solidi a (Germany), vol.76, no.2, p.429-35 (16 April 1983). An analysis is made of carrier transfer in a graded band-gap semiconductor with allowance for both, the photon- and the diffusion-drift transfer mechanisms of the nonequilibrium charge carriers with linear radiative and nonradiative recombination. The conditions expressed in terms of the experimentally measured recombination parameters are obtained, under which one mechanism prevails over the other. The calculated dependences of the effective shift length L_{eff} of the nonequilibrium carrier on grad E_g for different absorption models are investigated. The derived dependences are supported by tests performed on the solid solutions $n\text{-Al}_x\text{Ga}_{1-x}\text{As}$ silicon doped at high levels of doping. (12 refs.)

76972 Photogeneration and geminate recombination in amorphous silicon. F.Carasco, W.E.Spear (Carnegie Lab. of Phys., Univ. of Dundee, Dundee, Scotland).

Philos. Mag. B (GB), vol.47, no.5, p.495-507 (May 1983). Photogeneration in undoped amorphous silicon (a-Si) has been investigated at photon energies ϵ_{ph} from 3.1 to 1.3 eV, lying above and below the optical gap of the material (1.65 eV). The measurements were carried out on p-i-n junctions, deposited by the glow-discharge technique, in which the saturated (primary) photocurrent J_p under reverse bias is a reliable measure of the quantum efficiency of photogeneration, η . It is shown both by direct measurement of η and from the field dependence of J_p that at photon energies above 1.5 eV η closely approaches unity. $J_p(E)$ is completely independent of the applied field for E between 20 and 150 kV cm^{-1} which, according to the Onsager theory, gives a thermalisation length $r_0 \approx 400 \text{ \AA}$ and $\eta(20 \text{ kV cm}^{-1}) \approx 0.95$. It is concluded that geminate recombination does not impose any fundamental limitation on photogeneration in a-Si at photon energies of interest in photovoltaic applications. At $\epsilon_{\text{ph}} < 1.5 \text{ eV}$, involving transitions into electron tail states, η decreases rapidly and $J_p(E)$ shows a field dependence in agreement with the Onsager theory; geminate recombination thus plays a predominant role in this spectral range. The temperature dependence of J_p has been investigated and shows a rapid rise in activation energy for $\epsilon_{\text{ph}} < 1.5 \text{ eV}$, suggesting that photogeneration involves a thermal activation step into the extended states. These results are discussed on the basis of a simple model. (16 refs.)

76973 Hot carrier relaxation processes in 1.3 μm quaternary InGaAsP: analysis and application to temperature dependence of laser threshold. J. Shah, B. Etienne, R.F. Leheny, R.E. Nahory (Bell Labs., Holmdel, NJ, USA). Gallium Arsenide and Related Compounds, 1982, Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.303-10.

The authors discuss two aspects of carrier energy relaxation processes in 1.3 μm quaternary InGaAsP. They demonstrate that the combined effect of this alloy's four LO phonons on the carrier energy relaxation is well approximated by a single effective phonon with $\hbar\omega = 31.6$ meV for $35\text{K} < T_c < 160\text{K}$ and 33.5 meV for $160\text{K} < T_c < 500\text{K}$. Carrier heating effects are shown to contribute significantly to temperature sensitivity of threshold in 1.3 μm lasers. A single $T_c = 90\text{K}$ describes the data when T is taken to be the carrier temperature rather than the lattice temperature. (15 refs.)

72.20M Galvanomagnetic and other magnetotransport effects

76974 Transverse magnetophonon resonance in n-GaAs under pulsed high magnetic fields. G.Kido, N.Miura (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1734-9 (May 1983). Magnetophonon resonance of high purity epitaxial n-type GaAs was investigated in the configuration of $j \perp B$ at various temperatures from 77 to 303K using pulsed high magnetic fields up to 30 T. In the high magnetic field and low temperature region, a nonlinear increase of the amplitude against the field was clearly observed in the resonant oscillation. A relation between the damping factor and the magnetic field was determined to be $\gamma \propto B^{2/3}$ from the experiment, which suggests that the electron-phonon scattering is the dominant process for the damping at high magnetic field according to the Barker's theory (1972). (12 refs.)

76975 Conductivity and Hall coefficient studies in plastically deformed CdTe single crystals. M.Nagabhooshanam, V.Hari Babu (Dept. of Phys., Osmania Univ., Hyderabad, India).

Phys. Status Solidi a (Germany), vol.76, no.1, p.K89-92 (16 March 1983). The authors investigate the nature of dislocations formed due to plastic deformation by indentations in CdTe crystals and their influence on transport properties (Hall effect, conductivity, and carrier mobility). A probable explanation of the experimental results is also given. (11 refs.)

76976 New type of quantum oscillation of the transverse magnetoresistance of semiconductors. V.M.Polyanovskii, Nguyen Hong Shon (V.I. Lenin State Univ., Kishinev, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1857-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3273-5 (Nov. 1982). [received: May 1983]

A rigorous quantum-mechanical treatment of a quasirelativistic scattering mechanism is employed to predict maxima in the transverse magnetoresistance of nondegenerate semiconductors which occur when the separation between the Landau levels is equal to the width of the conduction band in the direction of the applied magnetic field. (6 refs.)

76977 Zero-gap type I semiconductor in a quantizing magnetic field. Yu.V.Petrov (All-Union Sci.-Res. & Planning Inst. of Mech. Processing of Minerals, Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1939-41 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3413-18 (Nov. 1982). [received: May 1983]

The conductivity of a semiconductor with a quasirelativistic electron energy spectrum in a quantizing magnetic field is calculated. The conductivity expressed in terms of the density of band states reduces formally to the expression obtained earlier by Skobov (1960) for a system with a one-band parabolic spectrum. The Shubnikov-de Haas effect is obtained in the quasi-classical approximation. The behavior of oscillation amplitudes for different occupancies of Landau subbands is discussed. It is shown that a dependence of the chemical potential μ on the magnetic field H leads to a shift of H in which the transverse conductivity is maximal compared with the usual maximum. (10 refs.)

76978 Conductivity and Hall effect in single crystals of CuCr₂Se₄ magnetic spinel. V.V.Tsurkan, K.M.Golant, I.M.Yurin, S.I.Radautsan, V.E.Tezlevan, V.G.Veselago (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1970-1 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3465-7 (Nov. 1982). [received: May 1983]

The authors have carried out an experimental study of the Hall effect and of the electrical conductivity of CuCr₂Se₄ single crystals at temperatures 4.2-300K in order to determine the influence of a phase transition on the kinetics of the electrical conductivity and also to obtain information on the mechanisms of carrier scattering. (8 refs.)

76979 Magnetoconcentration effect in the presence of transverse gradient of the thermal carrier generation. R.N.Litovskii, A.P.Medvid'. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.731-6 (May 1983). In Russian.

The problem is solved for the bipolar drift of the current carriers in intrinsic semiconductor plates in the presence of transverse conductivity anisotropy or a magnetic field, deflecting the carriers to one of the surfaces, and a transverse thermal generation gradient. The saturation current is shown to depend on the sign and value of the transverse temperature difference ΔT on the lateral surfaces of the plate at the constant mean temperature of the sample. At low ΔT the saturation current shows a linear dependence on ΔT , while at a sufficiently high ΔT , change of the sign results in a significant variation of the saturation current. The effect considered is common for a wide range of problems concerning the bipolar drift of intrinsic and injected current carriers in the presence of the transverse anisotropy of conductivity, nonuniformity of doping or nonuniform generation. (7 refs.)

76980 Magnetic-field dependence of the Hall factor of gallium arsenide. D.L.Rode, C.M.Wolfe (Washington Univ., St. Louis, MO, UA), G.E.Stillman.

Gallium Arsenide and Related Compounds, 1982, Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.569-72

The magnetic-field dependence of the Hall factor from 0.44 to 83 kG for electrons in n-GaAs at room temperature is examined experimentally and theoretically. Lateral uniformity of the moderately pure n-GaAs sample is determined from photoconductivity and infrared transmission measurements. Theoretical calculations include Kane bands, admixed wave functions, lattice scattering and Brooks-Herring scattering. Theoretical and experimental values of Hall factor agree to within 0.7 percent. 72.20P Thermoelectric effects

- 76981 Electrical conductivity, thermoelectric power and Hall effect in p-type molybdenite (MoS_2) crystal. S.R.G.Thakurta, A.K.Dutta (Dept. of Magnetism, Indian Assoc. for the Cultivation of Sci., Calcutta, India). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.407-16 (1983).
- Principal electrical conductivities and Seebeck coefficients, as well as Hall effect, in p-type single crystals of natural molybdenite (MoS_2) have been investigated within the temperature range 100K to 850K. The results have been discussed and the values of different parameters of the charge carriers obtained. (18 refs.)
- 76982 Electrical conduction in sintered $\alpha\text{-Sb}_2\text{O}_3$. M.Miyayama, S.Ogi, H.Yanagida (Dept. of Industrial Chem., Faculty of Engng., Univ. of Tokyo, Tokyo, Japan). *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.351-2 (May 1983).
- Electrical conductivity and thermoelectric power were measured on sintered $\alpha\text{-Sb}_2\text{O}_3$ at 250° to 780°C. Oxygen partial pressure dependence of the conductivity and sign of the Seebeck coefficient showed $\alpha\text{-Sb}_2\text{O}_3$ to be a p-type semiconductor above 600°C in the oxygen pressure range of 10^2 to 10^3 Pa. A hopping conduction was proposed from very small hole mobility with an activation energy of 18 kJ/mol. (9 refs.)
- 76983 Transport properties of thermoelectric materials for coolers. A.Sher, M.Shiloh, D.Ilycyer, D.Eger (Soreq Nuclear Res. Centre, Yavne, Israel). *J. Electron. Mater. (USA)*, vol.12, no.2, p.247-63 (March 1983).
- The Seebeck coefficient, thermal conductivity, electrical conductivity and Hall coefficient of cooler grade, p- and n-type ternary alloys of $\text{Bi}_2\text{Te}_3\text{-Sb}_2\text{Te}_3\text{-Sb}_2\text{Se}_3$ were measured between 10 and 300K. Between 300K and about 150K the temperature dependence of the transport properties can be explained by assuming nondegeneracy and a lattice scattering mechanism. The difference between the temperature dependence of the Hall effect in n- and p-type alloys can be explained by the presence of sub-bands of light and heavy holes in the valence band of p-type alloys. (15 refs.)

72.30 HIGH-FREQUENCY EFFECTS; PLASMA EFFECTS

- 76985 Excitation of ion cyclotron waves at the difference frequency of two microwave beams in a semiconductor. K.P.Maheshwari (Dept. of Phys., Government Coll., Rajasthan, India), G.Tarey. *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.463-6 (1983).
- Presents an investigation of the resonant excitation of the electrostatic ion cyclotron wave at the difference frequency of two microwave beams propagating in a magnetoactive solid state plasma, viz. n InSb. The resonant excitation of the electrostatic ion cyclotron wave occurs when the difference frequency of the two microwave beams and the difference of their propagation vectors satisfy the dispersion relation corresponding to the electrostatic ion cyclotron wave. For typical plasma parameters of n InSb and microwave beams of power densities 1 MW cm^{-2} , the power density of the excited ion cyclotron wave is 0.40 kW cm^{-2} when external magnetic field is 1.46 kG ($\omega_c/\omega = 0.1$). The power density of the excited ion cyclotron wave increases with the magnetic field. This study may provide new means for the characterisation and diagnostic of semiconductors. (8 refs.)

Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.359-62 (20 Nov. 1982). [received: June 1983]
- An electron-hole plasma in GaAs which is heated by a field initially stratifies along the direction perpendicular to the field at room temperature. This stratification results in the formation of numerous current filaments. As the voltage across the sample is increased, these filaments become stratified along the field direction into domains (striations), and the sample becomes filled with plasma 'droplets'. (6 refs.)

72.40 PHOTOCONDUCTION AND PHOTOVOLTAIC EFFECTS; PHOTODIELECTRIC EFFECTS

- 76987 Electrochemical study of the thermal treatment effects on Cu_3S thin films. R.Duo, E.Fatas (Electrochem. Dept., Univ. Autonoma de Madrid, Madrid, Spain), F.Arjona, E.Garcia Camarero. *Mater. Chem. & Phys. (Switzerland)*, vol.8, no.3, p.203-6 (March 1983).
- The effects of thermal treatments on the stoichiometry and photovoltaic properties of Cu_3S thin films have been studied. It has been observed that the evaporation of a thin copper film on Cu_3S , followed by thermal treatment in vacuum, improves the $\text{Cu}_3\text{S}/\text{CdS}$ heterojunctions due to a rise in the stoichiometry and fill factor. (4 refs.)
- 76988 Negative photoelectric effects in p-TiGaSe₂. S.G.Abdullayeva, V.A.Aliyev (Inst. of Phys., Acad. of Sci., Baku, Azerbaidzhan SSR). *Mater. Chem. & Phys. (Switzerland)*, vol.8, no.3, p.279-87 (March 1983).
- Deals with the results obtained while studying the photoelectrical properties of p-TiGaSe₂ crystals at high injection levels. Two phenomena have been recorded and investigated, namely the negative photoconductivity and the negative remanent photoconductivity. The current-voltage, time, spectral, lux, and temperature dependences of the above phenomena have been studied and the mechanisms of these phenomena are suggested. The microprobe studies conducted have allowed one to establish the presence of selenium inclusions in the form of 200 μm -long cylinders with butt-end diameters from 3 to 10 μm . The effect of these inclusions on the photoelectrical properties of TiGaSe₂ is shown. (14 refs.)
- 76989 An RF bridge technique for contactless measurement of the carrier lifetime in silicon wafers. T.Tiedje, J.I.Haberman, R.W.Francis, A.K.Ghosh (Corporate Res. Lab., Exxon Res. & Engng. Co., Linden, NJ, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2499-503 (May 1983).
- A contactless RF technique has been developed for measurement of the photoconductivity induced in silicon wafers by a flash of light from GaAs laser diodes. The carrier lifetime inferred from the photoconductivity decay correlates well with diffusion length measurements made on solar cells fabricated from the same wafers. The technique has been applied successfully to silicon whose resistivity is as low as $0.1 \Omega \text{ cm}$ and lifetime as short as 0.2 μs . (7 refs.)
- 76990 Self quenching of extrinsic photoconductivity in GaAs:Cr. R.Masut, C.M.Penchina (Dept. of Phys. & Astron., Univ. of Massachusetts, Amherst, MA, USA). *J. Electron. Mater. (USA)*, vol.12, no.2, p.323-44 (March 1983).
- Results of a combination of phototransport measurements (including extrinsic photoconductivity (PC), optical absorption, and photo Hall experiments) are presented to characterize the deep levels introduced by Cr in semi-insulating GaAs. The extrinsic PC shows a spectrum which sharpens rapidly as the temperature is lowered, and is quenched by an additive infrared source. This is explained with the aid of the photo-Hall measurements. The results are interpreted in terms of a simple model of an electron-hole recombination mechanism which is present at low temperature. This recombination causes self-quenching of the PC signal via a drastic reduction of the photogenerated free carriers. (19 refs.)

- A formula for the optical conductivity is derived from the Kubo relation in a framework of tight-binding approximation using a method due to Matsubara and Toyozawa (1961). The derived formula is applied to the calculation of the optical conductivity and optical absorption in the far IR of doped semiconductors at low temperatures. The calculated values of the optical absorption obtained using different approximated Green's functions are compared with the experimental data for Sb doped germanium. (23 refs.)
- 76994 On the role of surface phenomena in the Staebler-Wronski effect. A.G.Kazanski, V.F.Kiselev, E.A.Silave, V.S.Vavilov (Dept. of Phys., Moscow State Univ., Moscow, USSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.337-43 (16 March 1983).
- The results concerning the influence of adsorption of water vapour ammonia, and diethylether on the Staebler-Wronski effect in amorphous silicon are presented. It is shown that the effect is not due to the surface charging after adsorption. The influence of adsorption on the 'dark' conductivity and photoconductivity is observed only after the adsorption of water in the region of rather high concentrations of adsorbed molecules. This is, most probably, due to the proton processes. The sources of protons on the surface seem to be the coordination-bound water molecules. (21 refs.)

76995 The electric and photoelectric properties of TlSbSe₂ crystals in the region of impurity conduction. D.V.Gitsu, I.N.Grincheshin, N.S.Popovich (Inst. of Appl. Phys., Acad. of Sci., Kishinev, Moldavian SSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K5-7 (16 March 1983). Experimental results on the electric and photoelectric properties of p- and n-TlSbSe₂ crystals in the region of impurity conduction are presented. Measurements of the photoconductivity were made by the modulation method with spectral resolution of 40 to 60 Å. For clarifying the energetic position of local levels in the band gap of TlSbSe₂ crystals, the temperature dependence of the dark conductivity in the temperature interval 77 to 300 K was investigated. The temperature dependences of carrier concentration and Hall mobilities for n-TlSbSe₂ crystals are given. (2 refs.)

76996 Characteristic steps in the relaxation curves of field-quenched persistent photoconductivity of Pb_{0.75}Sn_{0.25}Te:In. K.H.Hermann, K.-P.Mollmann (Bereich Experimentelle Halbleiterphys., Humboldt-Univ. zu Berlin, Berlin, Germany).

Phys. Status Solidi a (Germany), vol.76, no.1, p.K67-70 (16 March 1983). The authors present further experimental facts concerning field-quenched persistent photoconductivity and to discuss how these results relate to the hypothesis of a ferroelectric state below T_c. In the experiments single-crystal bulk samples and epitaxial layers have been investigated. (8 refs.)

76997 The design of an organic photoreceptor with charge-acceptance memory. III. Electrical properties of PVK-diazonium salt system. J.Hanna, E.Inoue (Imaging Sci. & Engng. Lab., Tokyo Inst. of Technol., Yokohama, Japan).

Photogr. Sci. & Eng. (USA), vol.27, no.2, p.51-8 (March-April 1983).

For pt.II see ibid., vol.26, p.69 (1982). The electrical properties of a photoreceptor with a charge-acceptance memory consisting of PVK (poly-N-vinylcarbazole) diazonium salt, and TNF are investigated using several measurements and techniques. These include the dark and photo-induced discharge characteristics of the surface potential, the leakage current under corona charging and the photocurrent using a time of flight technique. It is concluded that the doping of diazonium salt introduces hole traps in PVK, and that the photo-induced reduction of charge-acceptance in the photoreceptor (the memory effect) is ascribed to the enhancement of the carrier injection efficiency from the conductive substrate into the organic layer. Based on these results, a possible explanation of the memory effect has been tested using the current-voltage characteristic of an insulator under a high electric field. (4 refs.)

76998 Transient photoconductivity and thermalisation in amorphous semiconductors. J.M.Marshall, C.Main (Dept. of Phys., Dundee Coll. of Technol., Dundee, Scotland).

Philos. Mag. B (GB), vol.47, no.5, p.471-80 (May 1983).

In a number of recent publications, transient photoconductivity data for amorphous semiconductors have been interpreted in terms of the thermalisation of excess charge carriers with localised states which are distributed over a range of energy. A central feature of the 'intuitive thermalisation' model, which has been applied in some such analyses, concerns the introduction of a demarcation energy separating 'shallow' from 'deep' traps. The position of this demarcation energy is defined solely in terms of localised state release time constants, and it is assumed that 'shallow' centres are in quasi-thermal equilibrium with extended states. The authors examine the validity of this approach, and the consequences of application of such a model in the analysis of localised state distributions. It is demonstrated that the thermalisation process is a complex function of trapping and release time constants, and that the influence of deep traps prevents the establishment of quasi-thermal equilibrium for shallower centres. They show that the model will, in the general case, yield erroneous results for the energy distribution of localised states. (13 refs.)

76999 Simultaneous effect of UV-irradiation and deformation. G.Turchanyi, J.Janszky, S.Racz, I.Tarjan (Res. Lab. of Crystal Phys., Budapest, Hungary).

Radiat. Eff. (GB), vol.64, no.1-4, p.175-9 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Reports on experiments performed on X-ray coloured KCl single crystals by means of dislocation photoconduction. This method makes use of the internal electric field developing in ionic crystals due to charged dislocations during their deformation. The effect of previous illuminations in the visible region on the photocurrent produced by VUV-light was also investigated, a memory effect and changes of the sign of the photocurrents were found under suitable conditions. It was shown that using visible light of high enough intensity the direction of the photocurrent produced by it also changes sign. The problems involved in the dislocation photoconduction method are discussed. (6 refs.)

77000 Photovoltaic measurement of bandgap narrowing in moderately doped silicon. J.A.Del Alamo, R.M.Swanson, A.Lietoila (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA).

Solid-State Electron. (GB), vol.26, no.5, p.483-9 (May 1983).

Solar cells have been fabricated on n-type and p-type moderately doped Si. The shrinkage of the Si bandgap has been obtained by measuring the internal quantum efficiency in the near infrared spectrum ($h\nu = 1.00-1.25$ eV) around the fundamental absorption edge. The results agree with previous optical measurements of bandgap narrowing in Si. It is postulated that this optically-determined bandgap narrowing is the rigid shrinkage of the forbidden gap due to many-body effects. The 'device bandgap narrowing' obtained by measuring the pn product in bipolar devices leads to discrepant values because (i) the density of states in the conduction and valence band is modified due to the potential fluctuations originating in the variations in local impurity density, and (ii) the influence of Fermi-Dirac statistics. (38 refs.)

77001 Anomalous photo-emf in a model of a heavily doped and compensated ferroelectric. V.B.Sandomirskii, Sh.S.Khalilov, E.V.Chenskii (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1885-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3318-26 (Nov. 1982). [received: May 1983]

A model of a heavily doped and compensated ferroelectric is proposed. The equilibrium properties of the fluctuation potential are discussed. It is shown that the influence of the spontaneous polarization P_s and the nonlinearity of the permittivity on the fluctuation potential gives rise to a nonequivalence of regions where the electric field is parallel and antiparallel to P_s . With uniform illumination, an uncompensated photo-EMF can occur, for example because of the nonequivalent recombination currents in space charge layers in these regions. The existence of a distinctive direction leads to a summation of elementary photovoltages along the c axis, resulting in an anomalously high photovoltage. Under strong illumination, the fluctuation potential is screened by carriers, and the photo-emf falls as the illumination becomes stronger. The intensity threshold corresponding to the onset of screening falls exponentially with decreasing temperature. The results from this model are compared with experiment. (22 refs.)

77002 Photoelectric spectroscopy of radiation defects in germanium. B.G.Golubev, V.I.Ivanov-Omskii, G.I.Kropotov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1937-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3410-12 (Nov. 1982). [received: May 1983]

An investigation was made of the influence of point defects created by γ rays on the spectrum of photothermal ionization of group V donors in Ge. An analysis of a defect-induced fine structure of lines due to optical transitions from the ground to excited states of Sb and P donors in a magnetic field demonstrated that point radiation defects are usually located at fixed positions in the vicinity of donor atoms. The energy separations between the peaks in the fine structure of the lines was used to estimate the degree of deformation near the central cell occupied by a donor. (7 refs.)

77003 Photoconductivity of Y₂O₃ crystals with self-localized excitons. V.N.Abramov, A.I.Kuznetsov (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.12, p.2108-9 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3698-701 (Dec. 1983).

Yttrium oxide Y₂O₃ (T_1 , $E_g = 6.1$ eV) crystals are of great interest since they represent an example of the self-localization of excitons in metal oxides. It is of interest to obtain additional data on the exciton self-localization in Y₂O₃ from the excitation spectra of the photoconductivity in the exciton maximum region and in the region of the long-wavelength edge of interband transitions. The authors' measurements were made on Y₂O₃ crystals grown by the Verneuil method. They used plates of $6.0 \times 3.0 \times 3.5$ mm dimensions with a working surface represented by the cleavage plane {111}. (5 refs.)

77004 The role of defects in formation of the cadmium iodide photosensitivity. A.B.Lyskovich, O.B.Kushnir, A.V.Gal'chinskii.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.707-9 (May 1983). In Russian.

The impurity photosensitivity of CdI₂ crystals has been investigated. It is shown that this photosensitivity is due to occupation of available trapping levels which are related to defects of the crystal structure. (8 refs.)

77005 Peculiarities of photoelectric phenomena in glassy As₂S₃.

N.G.D'yachenko, A.Yu.Popov, A.V.Tyurin, A.S.Sheveleva.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.742-8 (May 1983). In Russian.

He-Ne-laser-induced a.c. photoconductivity of glassy As₂S₃ was studied and the results obtained were analyzed using the compensated semiconductor model. Exposure of light and heating is supposed to give rise to processes causing changes in the concentration and properties of defects that play the role of trapping and recombination centres for nonequilibrium carriers. (17 refs.)

77006 Low temperature persistent photoconductivity in two-dimensional electron gas FETs. J.F.Rochette, P.Delescluse, M.Laviron, D.Delagebeaudeuf, J.Chevrier, N.T.Linh (Thomson CSF Central Res. Lab., Orsay, France).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.385-92.

Persistent photoconductivity effect (PPC) has been studied in AlGaAs layers, selectively doped GaAs/AlGaAs heterostructures and two-dimensional electron gas FET (TEGFET). Using the adequate rate equation and some simplifying assumptions the dark and light stationary regimes and the transitory regime are perfectly fitted at all temperatures by adjusting the unknown parameters. It is shown that, while in AlGaAs and heterostructures the PPC effect is eliminated by heating, in short gate length TEGFETs it can also be removed by applying a large drain voltage. (15 refs.)

72.50 ACOUSTOELECTRIC EFFECTS

77007 Propagation of surface acoustic waves in n-type GaAs films. Chi-Chong Wu (Dept. of Appl. Math., Nat. Chiao Tung Univ., Hsinchu, Taiwan), Jensen Tsai.

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.453-67 (May 1983).

The effect of nonparabolicity of the amplification of surface acoustic waves in n-type GaAs films is investigated quantum mechanically in the GHz-frequency region. Numerical results show that the amplification coefficient for the nonparabolic band structures is enhanced due to the nonlinear nature of the energy band in semiconductors. Moreover, the amplification coefficients in semiconductors depend on the temperature, the electronic screening effect, the

frequency of sound waves, the applied electric field, and the thickness of the semiconductor film. (12 refs.)

72.55 MAGNETOACOUSTIC EFFECTS

77008 Interaction of resonant particles with acoustic solitons in metals. V.Ya.Demikhovskii, G.M.Maksimova, V.E.Sautkin (Res. Physicotech. Inst., Gor'kii State Univ., Gor'kii, USSR). *JETP Lett. (USA)*, vol.36, no.7, p.299-303 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.244-7 (5 Oct. 1982). [received: May 1983]

A theory is derived for acoustic solitons in a metal plate in a quantizing magnetic field with an electronic nonlinearity much greater than the lattice nonlinearity. The damping law for the soliton amplitude is found for collisionless and collisional damping. (5 refs.)

77009 Parametric amplification of sound and magnetoacoustic echo in concentrated rare-earth paramagnets of the Van Vleck type. S.L.Tsarevskii (V.I. Ul'yanov-Lenin State Univ., Kazan, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2107-8 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3696-8 (Dec. 1983). The author shows that, in concentrated rare-earth paramagnets of the Van Vleck type in a static magnetic field $H \sim 50$ kOe, an elastic wave of frequency $\omega_1 (\sim 10^{10}$ Hz) may interact parametrically with the magnetic component of the electromagnetic pump field of frequency $2\omega_1$. This interaction may be used for parametric amplification of sound and should be observable as a 'magnetoacoustic echo' (an analog of the electroacoustic echo in nonlinear piezoelectric crystals). (7 refs.)

72.60 MIXED CONDUCTIVITY AND CONDUCTIVITY TRANSITIONS

77010 On the role of the correlation length near the onset of non-metallic conduction. Z.Ovadyahu (Brookhaven Nat. Lab., Upton, NY, USA). *Y. Imry*.

J. Phys. C (GB), vol.16, no.14, p.L471-6 (20 May 1983). The conductivity of indium oxide films was studied as a function of $k_F l$ (including $k_F l \leq 1$), film thickness, temperature and magnetic field. For sufficiently thin films the authors observe a change from logarithmic to faster temperature dependence below a temperature determined by R_D . The analogous crossover for thicker samples is shown to depend on $k_F l$. Whether a given system is 'thin' enough for R_D to be the relevant parameter in this respect is determined by the value of the correlation length ξ . (19 refs.)

77011 Electrical and Raman study of lithium boronate and boromolybdate glasses. A.Levasseur, M.Kbala, M.Sanz (Lab. de Chimie du Solide, CNRS, Talence, France), M.Couzi.

J. Solid State Chem. (USA), vol.47, no.3, p.256-63 (May 1983). In French. Conductivity studies of glasses obtained from the $B_2O_3-Li_2O-Li_2MoO_4$ and $B_2O_3-Li_2O-Li_2WO_4$ systems have been carried out. The presence of the transition element in tetrahedral coordination and with two different oxidation states is discussed. A Raman spectroscopy study shows that the MoO_4 or WO_4 tetrahedra are slightly compressed by the network forming lattice. (8 refs.)

72.70 NOISE PROCESSES AND PHENOMENA

77012 1/f noise in polycrystalline silicon resistors. H.C.de Graaff, M.T.M.Huybers (Philips Res. Labs., Eindhoven, Netherlands). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2504-7 (May 1983).

The 1/f noise in polycrystalline silicon resistors has been measured at room temperature. The resistors were manufactured in low-pressure chemical vapor deposition films, implanted with B, P, and As and processed in two different technologies with different temperature cycles. The spectral density was essentially independent of the type of implantation and of the processing. The results can be described with Hooge's empirical law (1978) and Klempner's model (1979) for the 1/f noise in Schottky barriers. At low doping levels Hooge's constant turned out to be $\sim 4 \times 10^{-3}$ and it decreased with increasing doping concentration, more or less as $(\mu/\mu_{\text{lattice}})^2$. (16 refs.)

77013 Grain boundaries as possible origin of flicker noise in GaP polycrystalline material. A.D'Amico, G.Petrocco, G.Stochino (Istituto di Elettronica dello Stato Solido, CNR, Roma, Italy), A.Salsano, G.Luzzi.

Phys. Status Solidi a (Germany), vol.76, no.2, p.K125-9 (16 April 1983). The authors indicate that grain boundaries in GaP polycrystalline material give a substantial contribution to the total low frequency noise. In particular they report results concerning excess noise measurements in GaP for two cases: a) when the polarization current is applied across a single grain, b) when the same current is applied across two different grains separated by only one grain boundary. Moreover both n- and p-type GaP materials are taken into consideration at room temperature (295K) and close to liquid nitrogen temperature (81K). (4 refs.)

77014 Low-frequency current noise and internal friction in solids. Sh.M.Kogan, K.E.Nagaev (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1921-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3381-8 (Nov. 1982). [received: May 1983]

A study is made of the carrier-mobility and resistivity fluctuations in a crystal which arise from the spontaneous movement of defects. These movements, in particular the reorientation of defects with a symmetry lower than the point symmetry of the perfect crystal, contribute to the internal friction, and this gives a relation between the current noise and the internal friction in solids. Conditions are derived under which the current noise due to defects exceeds that due to temperature fluctuations and the equilibrium current noise. It is shown that the current noise due to the spontaneous movement of defects is observable in metals. The 1/f low-frequency current noise intensity in metallic films estimated from the background in the internal friction spectra of metals is in agreement with the observed 1/f current noise. 73.00 ELECTRONIC STRUCTURE AND ELECTRICAL PROPERTIES OF SURFACES, INTERFACES, AND THIN FILMS

- Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982 See Entry 74219

73.20 ELECTRONIC SURFACE STATES

(for emission and impact phenomena, see 79.)

- 77015 The electronic structure of GaP (110) and Cu-phthalocyanine overlayers studied by ellipsometry. A.Ritz, H.Luth (Physikalisches Inst., Rheinisch-Westfälische Tech. Hochschule Aachen, Aachen, Germany). *Appl. Phys. A (Germany)*, vol.A31, no.2, p.75-80 (June 1983). Ellipsometric spectroscopy in the spectral range $1.4\text{ eV} < \hbar\omega < 4\text{ eV}$ is used to study cleaved GaP (110) surfaces after adsorption of hydrogen and oxygen and after deposition of Cu-Phthalocyanine (CuPc) molecules. The adsorption of gases and of CuPc induces band bending changes which are derived from changes of the optical constants in the space charge layer due to an electric field effect. For the clean surface, furthermore, information is obtained about electronic surface states. CuPc overlayers with thicknesses below one monolayer exhibit an optical absorption which suggests a chemisorption interaction through the macrocyclic π -system of the Pc-molecules. (28 refs.)
- 77016 Interface trap generation in silicon dioxide when electrons are captured by trapped holes. S.K.Lai (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2540-6 (May 1983). A characteristic interface trap was observed in a hole trapping experiment when electrons were captured by trapped holes injected by an avalanche in the silicon. The observations could be explained by the generation of new electronic states through relaxation of strained bonds which were proposed to be the origin of hole traps. The result is either a weak bond in the network or two dangling bonds with no net charge. The weak bond or dangling bonds gives rise to neutral traps in the bulk and interface traps at the interface of the oxide. The presence of interface traps for such defects at the interface is predicted by theoretical calculations. (40 refs.)
- 77017 Generation-annealing kinetics of the interface donor states at 0.25 eV above the midgap and the turn-around phenomena on oxidized silicon during avalanche electron injection. C.-T.Sah, J.Y.-C.Sun, J.J.-T.Zou (Dept. of Electrical Engng., Univ. of Illinois, Illinois, IL, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2547-55 (May 1983). The generation and the annealing kinetics of the donorlike peaked interface density of states (DOSS) at 0.25 eV above the midgap and the turn-around phenomenon of the flat-band voltage generated by the avalanche electron injection are reported. The generation of the peaked interface DOS follows a first-order kinetics and it anneals out at 25 °C following a second-order kinetics. The devices with dry oxide show a small buildup of peaked DOS as well as a small turn-around phenomenon. However, after a deionized (DI) water rinse before gate metallization, a large buildup of peaked DOS and turn-around states were observed. After avalanche electron injection is terminated, in the devices with small peaked DOS, the midgap voltage slowly drifts in the negative voltage direction under negative gate bias. However, in the devices with large peaked DOS, the midgap voltage slowly drifts in the positive gate voltage direction even under negative gate bias. Detailed analyses of both the generation and annealing data suggest that the peaked DOS is a donor which can account for most of the turn-around phenomenon as well as the midgap voltage instability phenomenon after avalanche electron injection. DI water dependence suggests that the peaked DOS and the turn-around states may be related to hydroxyl species in the oxide. (28 refs.)
- 77018 A covalent model for the bonding of adsorbed hydrocarbon fragments on the (111) face of platinum. C.Minot, M.A.Van Hove, G.A.Somorjai (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.441-60 (May 1983). A systematic molecular orbital study of the location of CH_3 and C-CH_3 ($n=1, 2, 3$) species on a Pt(111) single-crystal surface has been performed by using both a cluster model and a band structure calculation within the framework of the Extended Huckel Theory (EHT). These species may be involved in the hydrogenation/dehydrogenation processes of hydrocarbons. The observed dependence of the adsorption site on the number of hydrogens in the CH_n fragments suggests that any C-H bond breaking in CH_n species must involve a change of adsorbate bonding site. The carbon is found to be located on the surface in such a way as to complete its tetravalency. Thus, CH occupies a three-fold coordinated hollow site, CH_2 a two-fold coordinated bridge site and CH_3 a one-fold coordinated top site, C-CH_3 is found to be perpendicular to the surface in a three-fold hollow site in agreement with experimental observations. It is also found that a displacement of $\text{C-CH}_2\text{-R}$ to a top site makes a β C-R cleavage easier. (61 refs.)

73.30 SURFACE DOUBLE LAYERS, SCHOTTKY BARRIERS, AND WORK FUNCTIONS

- 77019 Invalidation of the scaling property of surface potential kinetics in HDPE. H.von Berlepsch, L.Brehmer (Inst. für Polymerenchem. 'Erich Correns', Akad. der Wissenschaften, Teltow-Seehof, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K27-9 (16 March 1983). The study of the surface potential kinetics $V(t)$ has proved to be a powerful tool in investigating charge carrier transport processes for partially crystalline high-resistance polymer solids. The authors investigate in detail this problem from the experimental point of view on HDPE. Excess charge was introduced into the sample by exposure to a positive or negative point corona discharge (corona voltages up to 8 kV, air gap 10^{-2} m). After a corona charging for 10 s the isothermal potential decay was measured by the field mill technique. (11 refs.)

73.40 INTERFACES

- 77020 Capacitance/voltage characteristics of semiconductor-insulator-semiconductor (SIS) structure. K.Nagai, Y.Hayashi, T.Sekigawa (Electrotech. Lab., Ibaraki, Japan). *Electron. Lett. (GB)*, vol.19, no.10, p.376-7 (12 May 1983). Ideal capacitance/voltage curves of $\text{Si}(2)\text{-SiO}_2\text{-Si}(1)$ structure are computed in the absence of surface states and oxide changes with the SiO_2 thicknesses, conductivity types, impurity concentrations of $\text{Si}(1)$ and (2) as parameters. Impurity concentrations of $\text{Si}(1)$, (2) and SiO_2 thickness can be estimated from the measured capacitance/voltage curves by comparing them with the calculated ones as in the case with the conventional MOS structure. (5 refs.)
- 77021 Incomplete space-charge layers in semiconductors. D.Redfield (RCA Labs., Princeton, NJ, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2860-2 (May 1983). Analysis of the potential and field profiles in space-charge layers near semiconductor interfaces is extended to consider cases in which the thickness of the semiconductor layer is less than the conventional 'width' of the space-charge region that would exist if the semiconductor were very thick. It is shown that both electrostatic effects and possible Fermi-level changes are important in these cases. The apparent deficiency of charge that such thin layers present is found to be illusory; adequate charge is always available. However, the process which provides this charge may alter the work function of the semiconductor and therefore change the potential distribution. (5 refs.)
- 77022 The thickness dependence of excess carrier lifetime and mobility in amorphous silicon junctions. H.Steemers, W.E.Spear, P.G.Ie Comber (Carnegie Lab. of Phys., Univ. of Dundee, Dundee, Scotland). *Philos. Mag. B (GB)*, vol.47, no.5, p.L83-8 (May 1983). Fast transient methods have been used to determine the electron drift mobility μ_e and lifetime τ_e in a-Si p-i-n junctions ranging in thickness from $d \approx 0.4$ to $15 \mu\text{m}$. Similar data were obtained for holes on the thinner specimens. For $d < 4 \mu\text{m}$, $\mu_e \tau_e \approx \mu_h \tau_h$, and both are proportional to d^2 . It is shown that the thickness dependence of $\mu_e \tau_e$ arises almost entirely from that of τ_e . For $d \geq 10 \mu\text{m}$, τ_e tends towards a constant value of $1\text{-}2 \mu\text{s}$, which represents the true electron lifetime of the material with respect to deep centres. The free lifetime is about 100 ns. A possible explanation for the observed thickness dependence of $\mu_e \tau_e$ is given. (9 refs.)
- Barrier height enhancement in semiconductor-insulator-semiconductor solar cells due to surface states and insulator charges See Entry 78010

73.40L Semiconductor-to-semiconductor contacts, p-n junctions, and heterojunctions

- 77023 Empirical rule to predict heterojunction band discontinuities. A.D.Katnani, G.Margaritondo (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2522-5 (May 1983). The authors have developed an empirical table of valence-band-edge energy positions for group IV, III-V, and II-VI semiconductors, referred to the valence-band edge of germanium. The energy positions listed in the table were deduced from systematic photoemission measurements of heterojunction valence-band discontinuities performed on semiconducting substrates with Si or Ge overlayers. The table can be used to estimate the valence-band discontinuities of heterojunctions between compound semiconductors, with several advantages and better accuracy with respect to the widely used twenty-year-old electron-affinity rule and to other more recent theories. (32 refs.)
- 77024 The heterojunction $\text{ZnSe}(\text{Zn}_{1-x}\text{Cd}_x\text{Te})_{1-y}(\text{In}_y\text{Te}_3)_y$ having high sensitivity in the visible light range and its applications. S.Fujiwara, T.Chikamura, M.Fukai (Materials Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.567-75 (April-May 1983). The effect of a ZnSe film on the heterostructural $\text{ZnSe}(\text{Zn}_{1-x}\text{Cd}_x\text{Te})_{1-y}(\text{In}_y\text{Te}_3)_y$ film was studied from the standpoint of crystal growth. It is made clear that the ZnSe film improves the crystallinity of the $(\text{Zn}_{1-x}\text{Cd}_x\text{Te})_{1-y}(\text{In}_y\text{Te}_3)_y$ film evaporated on the ZnSe film and improves the spectral sensitivity of the heterostructure in the visible to the near-infrared light range. This heterostructure which consists of many elements can be fabricated by simple evaporation and anneal methods. One of the applications of this heterostructure is the photoconductive target in a camera tube. A camera tube with such a heterostructure is called 'Newvicon' and has excellent features such as high sensitivity, low dark current, no burn-in and small lag. This heterostructure can be also applied to illuminometers, photometers and solid state imagers. (10 refs.)
- 77025 Angle-lapping and staining observations of Si doping superlattice structures. T.Sakamoto (Electrotech. Lab., Ibaraki, Japan). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.705-6 (April-May 1983). The angle-lapping and staining technique has been successfully used for the observation of a whole view of carrier profiles of Si doping superlattice structures with very thin multi-layered p/n junctions. The Si MBE films obtained are single crystalline and have very smooth surfaces. The carrier concentrations of the p-layers and the n-layers are estimated to be 3×10^{17} and 1×10^{16} atoms/cm³, respectively. Angle-lapping was done very slowly using silica powder on a polyacrylate plate of 5 mm thick for about 10-20 min. The angle-lapped surfaces are very smooth and flat. Staining was done using a solution of $\text{HF-HNO}_3\text{-HCHO}$ under a 100 W incandescent lamp for 10-20 s. (8 refs.)
- 77026 Magnetoresistance anisotropy due to the 2D-electron subsystem at a GaAs/AlGaAs interface. V.A.Volkov, D.V.Galchenkov, I.M.Grodnenski, K.V.Starostin (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR). *JETP Lett. (USA)*, vol.36, no.9, p.420-4 (5 Nov. 1982). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.343-6 (5 Nov. 1982). [received: June 1983] Effects of the coexistence of 2D and 3D electrons in the structure GaAs/n-AlGaAs have been studied for the first time over the temperature range $T = 4.2\text{-}300\text{K}$. The angular dependence of the magnetoresistance might be used as a new test of the two-dimensionality of an electron subsystem. This test would work over broad ranges of T and H , in contrast with the Shubnikov-de Haas effect. (4 refs.)
- 77027 The variation of the p/n junction position in GaAs/GaAlAs double heterostructures grown by low pressure MO VPE. S.D.Hersee, M.Baldy, J.P.Duchemin (Thomson-CSF, Domaine De Corbeville, Orsay, France). *J. Electron. Mater. (USA)*, vol.12, no.2, p.345-57 (March 1983). A modified contact resistance profiler has been used to determine the doping type of the active layer in GaAs/GaAlAs double heterostructure grown by low pressure metal-organic vapour phase epitaxy (LP-MO VPE). It was found that under normal growth conditions, the p/n junction is located inside the 'p-type' $\text{Ga}_{0.65}\text{Al}_{0.35}$ confinement layer. SIMS data show that this displacement of the p/n junction is due to electrical compensation of the zinc doping. (6 refs.)
- 77028 Some electrical properties of $\text{Au}_x\text{Te}/\text{CdTe}$ heterojunctions on CdTe thick films. J.Touskova, D.Kindl, J.Tousek, E.Klier (Dept. of Semiconductor Phys., Charles Univ., Prague, Czechoslovakia). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.365-74 (16 March 1983). Measurements of I - U characteristics at several temperatures, the voltage and frequency dependences of capacitance, and the photocurrent of samples are used for studying some electrical properties of heterojunctions formed on sintered layers of n-type CdTe. According to the geometrical arrangement, two types of samples are investigated: group A on an insulating substrate with planar electrodes, group B on a conducting substrate with sandwich electrodes. The p-n junctions are formed in both cases by chemical reaction with AuCl_3 solution. The transport of charge across the junction at both, A and B groups is controlled by some process of tunnelling through the barrier from one side and by thermal emission from the opposite side of the junction followed by recombination at interface states. The C - U characteristics of B-samples show the usual form typical for the abrupt junction, whereas the capacitance of A-samples is essentially influenced by the internal capacitance of the polycrystalline layer. An energy band model of the junction is suggested. (8 refs.)
- 77029 Effect of tangential magnetic field on the two-dimensional electron transport in N-AlGaAs/GaAs superlattices and hetero-interfaces. H.Sakaki, H.Ohno, S.Nishi, J.Yoshino (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.703-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Magnetoresistance $\Delta\rho/\rho$ of a two dimensional electron gas at N-AlGaAs/GaAs heterojunction interfaces and superlattices is studied for the magnetic field, B_y , parallel to heterojunctions. $\Delta\rho/\rho$ at the interface is found to contain a term having linear dependence both on B_y and on electric field parallel to the current, E_x . This is ascribed to the deformation of wavefunction by the Lorentz force, which affects the electron scattering by impurities distributed only on one side of the interface. Similar measurement on superlattices is found effective in evaluating the possible asymmetry of the structure and the spatial distribution of scatterers. (7 refs.)

- 77030** 2D hot electron transport in a modulation-doped GaAs/AlGaAs interface. M.Inoue, H.Hida, M.Inayama, Y.Inuishi (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan), K.Nanbu, S.Hiyamizu. *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.720-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Direct evidence of polar optical phonon emission and intersubband transfer of 2D electrons has been observed in GaAs/Al_xGa_{1-x}As ($x=0.3$) heterostructures. Magnetophonon resonance as well as SDH effect were observed simultaneously in magneto-resistance data at 4.2K. These electron scatterings are responsible for the cooling process of high mobility 2D electrons heated by applied electric fields. The electron temperature and velocity were also measured to reveal hot electron effects of the 2DEG. (14 refs.)
- 77031** Electron transport in heterojunctions and superlattices. K.Hess (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.723-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Theoretical and experimental results are presented for high field transport in heterojunction structures parallel to the layers. It is shown that these structures exhibit new transport effects with high potential for device applications. A novel oscillator principle and novel storage and switching phenomena are described. These effects are real-space analogies to well-known k-space effects such as the Gunn effect. (17 refs.)
- 77032** Electronic properties of InAs-GaSb superlattices. Y.Guldner (Groupe de Phys. des Solides, Ecole Normale Supérieure, Paris, France). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.735-40 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Transport and far-infrared magneto-absorption performed in InAs-GaSb superlattices covering the entire semimetallic regime are described. The sub-band parameters are determined, evidencing the semimetallic nature, the three-dimensional character of the superlattices and the confinement of both electrons and holes at the interfaces in the heterojunction limit. (18 refs.)
- 77033** GaSb-AlSb-InAs multi-heterojunctions. H.Takaoaka, Chin-An Chang, E.E.Mendez, L.L.Chang, L.Esaki (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.741-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). The authors have made transport measurements on GaSb-AlSb-InAs multi-heterojunctions prepared by MBE. The result has been analyzed on the basis of electron tunneling across thin AlSb layers. (7 refs.)
- 77034** Mobility in modulation doped GaAs-GaAlAs superlattices. G.Fishman, D.Calecki (Groupe de Phys. des Solides, Univ. de Paris VII, Paris, France). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.744-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). The authors use an analytical approach to calculate the electron mobility parallel to the layers in modulation doped GaAs-GaAlAs superlattices; it allows comparison with recent experimental results. They take into account intersubband electron scattering that occurs when electron density becomes sufficiently high. Order of magnitude and variations of the Hall mobility with the undoped spacer of GaAlAs and with the electron density are explained and discussed. (6 refs.)
- 77035** Electronic structure of semiconductor superlattices. M.Altarelli (Max-Planck-Inst. für Festkörperforschung, Stuttgart, Germany). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.747-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). A new approach to the calculation of the electronic structure of semiconductor superlattices in the envelope-function approximation is presented and applied to the type II InAs-GaSb system. The method allows a realistic description of the band edges of the constituent materials, and yields, therefore, accurate results for the sub-band dispersion in the direction parallel to the layers. Some novel aspects of the semiconductor-semimetal transition in InAs-GaSb are pointed out. (8 refs.)
- 77036** Hot electron effects in heterolayers. P.J.Price (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.750-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Phenomena of interaction in the direction perpendicular to the layer planes, for hot electrons in heterolayer structures such as may be grown by molecular beam epitaxy, are discussed. In particular, energy transfer between electrons in neighboring heterolayers, due to mutual Coulomb scattering and escape of electrons from a heterolayer, due to phonon scattering processes, are analyzed; and it is shown that substantial rates are possible. (no refs.)
- 77037** Two dimensional magnetophonon resonance in GaInAs-InP superlattices. M.A.Brummell, R.J.Nicholas (Clarendon Lab., Univ. of Oxford, Oxford, England), J.C.Porter, M.Razeghi, M.A.Poisson. *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.753-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Cyclotron resonance and magnetophonon resonance studies have been made of superlattices grown from thin layers of Ga_{0.47}In_{0.53}As and InP, which exhibit two dimensional behaviour at temperatures up to 250K. The electron effective mass varies with layer thickness in reasonable agreement with the calculated non-parabolicity. The LO phonon energies are calculated from magnetophonon oscillations and mass values obtained from cyclotron resonance. A strong series of oscillations results from the dominant 'GaAs-like' mode in GaInAs. A second, weaker series corresponds to the energy of the InP LO phonon. This is evidence for a long range phonon interaction, with the field of the phonons extending into the GaInAs to cause a significant coupling with the electrons bound in the quantum wells. (13 refs.)
- 77038** Frequency properties of Ge-Si solid solution p-n junctions. M.Ya.Bakirov, R.S.Madatov, Yu.M.Mustafayev. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.6, p.153-4 (June 1982). Translation of: *Radioekh. & Elektron. (USSR)*, vol.27, no.6, p.1239-40 (June 1982). [received: May 1983] Ge-Si solid solutions are promising materials for making visible and IR radiation detectors. There are a number of papers in the literature that are devoted to Ge-Si alloy photodetectors. The literature contains no information about the lag of these photodetectors. The authors present the results of tests of the frequency characteristics of Ge-Si solid solution p-n junctions, which were made by the diffusion of antimony into p-type crystals with initial carrier densities of 10^{15} cm^{-3} and had an area of $1-2.5 \text{ mm}^2$. The frequency charac-

teristics were measured in samples with a sensitivity of 0.3-0.5 A/W. An LG-126 laser with $\lambda=1.5 \mu\text{m}$ was used as the radiation source. The radiation was modulated with an ML-4 electrooptic modulator. The photocurrent in the load ($R_1=10^5 \text{ ohms}$) was measured by means of a U2-8 wide-band amplifier. (4 refs.)

- 77039** Actual turn-on voltage of microplasmas [p-n junctions]. V.P.Shapovalov. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.6, p.154-5 (June 1982). Translation of: *Radioekh. & Elektron. (USSR)*, vol.27, no.6, p.1240-2 (June 1982). [received: May 1983] The turn-on voltage (U_{on}) of microplasma centers in p-n junctions is a function of external factors that give rise to the carrier generation rate in the microplasma region. An investigation of the quantitative dependence of the microplasma U_{on} on the temperature and the overvoltage increment (dU/dt) through the p-n junction is discussed for increasing the operation reliability of semiconductor devices. (5 refs.)
- 77040** Heterolayer screening of an external ion field. P.J.Price (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.377-82 (May 1983). The theory of screening by heterolayer carriers, in their ground sub-band, is used to investigate the conditions in which the classical image charge applies to the polarization by an external ion field. An estimate of the field penetrating to the far side of the heterolayer is obtained. (5 refs.)
- 77041** Effect of a static field on the parameters of a superlattice created in a semiconductor by a standing laser wave. I.M.Dykman, P.M.Tomchuk (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1847-50 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3255-61 (Nov. 1982). [received: May 1983] A quantum transport equation for the one-particle distribution function of electrons in a semiconductor subjected to a static field F_0 and to the field of a standing laser wave is derived. The parameters of the superlattices of the electron density, of the field strength, and of the electron temperature which are created by the laser wave are determined. Such lattices have the same spatial period but the dependences of their amplitudes on F_0 are different. By varying F_0 and the lattice temperature, it is possible to alter the relative magnitudes of the amplitudes of the sublattices and even to reduce the amplitude of any sublattice to zero. (12 refs.)
- 77042** The heterojunction parameters from a microscopic point of view: recent progress. A.D.Katnani, R.R.Daniels, Te-Xiu Zhao, G.Margaritondo (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.27 The use of surface-sensitive experimental techniques produced in the past year important advances in the understanding of the microscopic nature of heterojunction parameters. In particular, systematic valence band discontinuity measurements were extended to a large number of interfaces involving Si overlayers and the results confirmed that the LCAO approach by Harrison (1977) is the best first-order calculation of this parameter. Local effects, however, limit the accuracy of the estimate to 0.2-0.3 eV. Evidence was obtained to show that surface defects play an important role in the interface Fermi-level pinning for heterojunctions involving III-V compounds, and therefore in the establishment of the built-in potential. The authors found that the pinning position for GaAs-Si, 0.7(3) eV above the top of the GaAs valence band, is consistent within the experimental accuracy with that reported by Monch et al. (1982) for Ge on GaAs. Furthermore, the difference between the pinning positions of E_F for GaAs-Si and for GaP-Si qualitatively reproduces the theoretical predictions for surface antisite defects. (3 refs.)
- 77043** Electrical properties of ZnO-Bi₂O₃-metal oxide heterojunction—a clue of a role of intergranular layers in ZnO varistors. K.Eda (Wireless Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan). Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.381-92 Zinc Oxide (ZnO) Ceramics-Bismuth Oxide (Bi₂O₃). Metal Oxide thin film heterojunction made by sputtering technique showed a highly non-Ohmic property. The voltage-current characteristics and the dielectric properties showed dependence on Bi₂O₃ metal oxide thin film thickness. In this paper after reviewing and discussing the electrical properties of ZnO varistors, the role of intergranular layers in the ZnO varistor is discussed based on experimental results with the heterojunction. 73.40M Semiconductor-electrolyte contacts

77044 High pressure photoelectric studies of semiconductor-electrolyte systems. D.A.Gulino, L.R.Faulkner, H.G.Drickamer (Materials Res. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2483-8 (May 1983). Data are presented which show the behaviour of the valence and conduction band-edge energies (E_v and E_c , respectively) as a function of pressure for the n -type semiconductor electrodes TiO_2 , CdS , and CdSe . For TiO_2 , the 3 meV/kbar increase in the band-gap energy (E_g) is due entirely to an increase in E_c . For CdS , the 5.1 meV/kbar increase in E_g is the difference between the 9.5-11.5 meV/kbar increase in E_c and the (calculated) 4.5-6.5 meV/kbar increase in E_v . In the case of CdSe , both E_c and E_v move to lower energies with increasing pressure. Their behaviour is complex. (22 refs.)

77045 Surface states at semiconductor-liquid junction. K.Kobayashi, Y.Aikawa, M.Sukigara (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2526-32 (May 1983). Surface states at a junction of n - TiO_2 and aqueous solution were studied by means of the capacitance measurement. It appeared that, from the relation between surface-state capacitance and electrode potential, surface states with state density of $8 \times 10^{-4} \text{ cm}^{-2}$ were located at 0.5 eV below the bottom of the conduction band. The electron capture cross section of $2.0 \times 10^{-19} \text{ cm}^2$ was obtained from the frequency dependence of surface-state capacitance. The effect of the UV irradiation of TiO_2 on the surface-state capacitance suggested that this surface state originated from adsorbates. (25 refs.)

77046 Light-induced recombination centers during pulse radiolysis of an electrolyte-semiconductor system. A.A.Revina (Inst. of Electrochem., Acad. of Sci., Moscow, USSR). *Sov. Electrochem. (USA)*, vol.18, no.8, p.989-91 (Aug. 1982). Translation of: *Elektrokhimiya (USSR)*, vol.18, no.8, p.1114-17 (Aug. 1982). [received: May 1983] Luminescence measurements were made during pulse radiolysis which were based on the recording of the emission of the excited species formed under the action of ionizing radiation. The radiolytic conversions were studied in an heterogeneous system of electrode (titanium oxide anode)-electrolyte, and in separate experiments TiO_2 -electrolyte-Pt. The electrolyte chosen was a saturated methanolic solution of magnesium chloride, hexahydrate. The results obtained for the spectral and kinetic characteristics of the luminescence signals for heterophase pulse radiolysis and the detection of a photoradiation effect permit the forward view that this method considerably widens the possibilities of studying the mechanism of reactions of intermediate species at an electrode/electrolyte interface. (6 refs.)

73.40N Metal-nonmetal contacts

77047 Electrical characteristics of amorphous iron-tungsten contacts on silicon. M.Finetti, E.-T.-S.Pan, I.Suni, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA). *Appl. Phys. Lett. (USA)*, vol.42, no.11, p.987-9 (1 June 1983). The electrical characteristics of amorphous Fe-W contacts have been determined on both p -type and n -type silicon. The amorphous films were obtained by cosputtering from a composite target. Contact resistivities, $\rho_c = 1 \times 10^{-7}$ and $\rho_c = 2.8 \times 10^{-6}$, were measured on n^+ and p^+ silicon, respectively. These values remain constant after thermal treatment up to at least 500°C. A barrier height, $\phi_{bn} = 0.61 \text{ V}$, was measured on n -type silicon. (18 refs.)

77048 Au-Mg improved ohmic contacts to p -GaAs. N.A.Papanislaou, N.Christou (Naval Res. Lab., Washington, DC, USA). *Electron. Lett. (GB)*, vol.19, no.11, p.418-20 (26 May 1983). A novel ohmic contact alloy to p -GaAs consisting of 96 weight % Au and 4 weight % Mg, a Mo barrier metal and Au overlay is described. Contact resistivities as low as $8 \times 10^{-5} \Omega \text{ cm}^2$ are achieved on heavily doped substrates. Auger sputter profiles show these contacts to be thermally stable up to 450°C. (7 refs.)

77049 Schottky barrier type diode with an electrochemically prepared copolymer having pyrrole and N -methylpyrrole units. H.Koezuka, S.Etoh (Materials Engng. Lab., Mitsubishi Electric Corp., Hyogo, Japan). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2511-16 (May 1983). A Schottky type diode has been constructed with the electrochemically prepared copolymer having pyrrole and N -methylpyrrole units and a low work function metal (In). The heat treatment of the copolymer in air was performed in order to stabilize the electrical characteristics of the device before the deposition of a blocking electrode. The electrical properties have been investigated by means of I - V and C - V measurements. The diode quality factor and the barrier height have been obtained to be $n=1.2$ and $\phi_b=0.81 \text{ V}$ by applying a thermionic emission theory, respectively. At high current densities in the forward direction, a space-charge-limited current has been observed. This observation would be due to the charge-injection across the thin oxidized layer which would be formed during the heat treatment of the copolymer in air. Other junction parameters have been also determined by means of C - V measurements. (22 refs.)

77050 Tunnel barriers on Pb-In-Au alloy films. J.M.Baker, J.H.Magerlein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2556-68 (May 1983). Tunnel barrier oxides consisting primarily of In_2O_3 formed on Pb-In-Au alloys by various thermal and RF-plasma oxidation techniques were characterized in situ using ellipsometry and Auger electron spectroscopy (AES). The results were compared to measurements of the Josephson critical current density j_c and the specific capacitance of tunnel junctions fabricated on the same wafers. It was found for junctions with oxides consisting entirely of In_2O_3 that j_c exceeded 3 KA/cm^2 and did not depend strongly on oxide thickness from about 3 nm (for thermally-grown oxides) to 4.5-7 nm (for RF-grown oxides). The addition of a thin layer of PbO_2 at the top of the barrier, either by backscattering during RF oxidation or by deposition onto a thermal oxide, caused by a substantial decrease in j_c , while the presence of PbO in the bulk of the oxide had little effect. The specific capacitance of the lower current density junctions was essentially the same for either 3- or 4.5-6 nm thick oxides and was consistent with a barrier thickness of order 2 nm. These results are interpreted as evidence that tunneling occurs through a Schottky barrier in the indium oxide at the interface with the counterelectrode. Such a barrier, which is consistent with the known behavior of In_2O_3 as a degenerately-doped semiconductor, would account for effective tunneling and capacitance thicknesses less than the physical oxide thickness. (42 refs.)

77051 Tunneling current density $j(V)$ for Pb-In-Au alloy junctions and tunnel barrier modeling. J.H.Magerlein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2569-77 (May 1983). Tunnel barriers formed by RF oxidation of Pb-In-Au alloys and consisting largely of In_2O_3 have been studied by measuring the current density as a function of applied voltage $j(V)$ for voltages up to 1 V. The junctions studied here, which were oxidized on Pb- or photoresist-coated RF cathodes, showed no evidence of a barrier height below about 1 eV. A trapezoidal barrier with a height of at least 1 eV and a thickness equal to that of the oxide film, roughly 6 nm, would have a tunneling current far below that observed for these junctions. Furthermore, the measured $j(V)$ curves were inconsistent with those calculated for a trapezoidal barrier, even for a barrier thickness less than the physical oxide thickness. The $j(V)$ curves were, however, similar to those calculated for tunneling through a Schottky barrier in the indium oxide at the interface with the counterelectrode. Such a barrier, which is also suggested by recent measurements of oxide thickness and junction electrical properties at low voltages, might be expected to form between the metal electrodes and In_2O_3 , which can be a degenerately-doped n -type semiconductor. (33 refs.)

77052 Rate of polarization of electrons during resonant tunneling from W-EuS. R.A.Melikyan (State Univ., Erevan, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1422-3 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2308-10 (Nov. 1982). [received: May 1983] The acceleration of polarized electrons to GeV energies in ring accelerators requires a polarized electron source capable of producing electrons at 10^{11} - 10^{12} e/us with emittance 10^{-3} rad cm , and the beam polarization P should be high and the energy spread minimal. The author finds ways to increase the polarized electron current during resonant tunneling using the experimental data of Kisker et al. (1976 and 1978). The author shows that the increase in the internal barrier near the W-EuS interface may be attributed to the presence of surface ferromagnetic semiconductor states near the surface and to mirror-charge forces. (9 refs.)

77053 Si-transition metal interface formation and bulk electronic structure of 3d metal silicides. A.Francioci, D.G.O'Neill, J.H.Weaver (Synchrotron Radiation Center, Univ. of Wisconsin-Madison, Stoughton, WI, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.18 The authors have performed photoemission investigations of Si-Ca, Si-Ti, and Si-Cr interface formation through analysis of the interface electronic structure as a function of metal coverage on cleaved Si(111). To characterize Si-metal chemical bonding in general and to emphasize the effect of stoichiometry variations on the electronic structure, they have also conducted studies of bulk Ti, V, Cr, Co, and Ni silicides cleaved in situ. The bulk results reveal the Si- p /metal- d character of the bonding, the varying importance of the 'non-bonding' metal-derived d features, and the decoupling of Si- p and Si- s states predicted by recent calculations. Comparison of bulk silicides and the products of interface reaction show important differences both in the nonbonding d states and in the hybrid Si- p /metal- d orbitals. In all cases, interface reaction occurs after a first stage of interface formation in which the emission from intrinsic Si surface state is removed and the final value of the Schottky barrier height is reached. The fundamental parameters of the junction, therefore, are determined by microscopic reaction on a scale of 1-2 atomic layers rather than by the subsequent stages of Si-metal reaction when an interface region of complex morphology is created. (no refs.)

77054 Effects of surface layer defects and adsorbed oxygen on TiO_2 -rutile Schottky barriers. M.Levinson (Bell Labs, Murray Hill, NJ, USA). Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.363-7 The electronic properties of TiO_2 surfaces are of interest to further understanding of grain boundary effects in TiO_2 and ZnO based varistor devices. Schottky barriers have been fabricated by Au or Al metallization on Nb doped TiO_2 -rutile [001] single crystal surfaces. Surface conditions included the presence or absence of either mechanical polishing induced surface defects and/or adsorbed oxygen. I-V measurements on Au samples indicate that surface defects yield ohmic behavior, but the defects may be electrically compensated by adsorbed oxygen to give non-ohmic I-V curves. All Al junctions show ohmic behavior which is interpreted in terms of reaction with surface oxygen. These results explain the necessity of firing varistor materials in an oxidizing atmosphere and suggest that the role of additives in these materials is to stabilize the oxygen concentration at the grain boundaries. (9 refs.)

Fabrication of GaAs-Mo-Si structures by metalorganic chemical vapor deposition and laser annealing See Entry 77572

73.40Q Metal-insulator-semiconductor structures (inc. semiconductor-to-insulator)

77055 Interfacial electrical properties of ion-beam sputter deposited amorphous carbon on silicon. A.A.Khan, J.A.Woolam (Dept. of Electrical Engng., Univ. of Nebraska, Lincoln, NE, USA), Y.Chung, B.Banks. *IEEE Electron Device Lett. (USA)*, vol.EDL-4, no.5, p.146-9 (May 1983). Amorphous, 'diamond-like' carbon films have been deposited on Si substrates, using ion-beam sputtering. The interfacial properties are studied for an Al/C/Si MIS system using capacitance and conductance measurements. Data are analyzed using existence theories for interfacial electrical properties. The density of electronic states at the interface along with corresponding time constants are determined, and the density of interface states is unusually low for an as yet unoptimized structure. (16 refs.)

77056 Radiation effects in nitrided oxides [MOS devices]. F.L.Terry, Jr., R.J.Aucoin, M.L.Naiman, P.W.Wyatt (Lincoln Lab., MIT, Lexington, MA, USA), S.D.Senturia. *IEEE Electron Device Lett. (USA)*, vol.EDL-4, no.6, p.191-3 (June 1983). Electron radiation effects on silicon dioxide films, before and after ammonia annealing (nitridation), have been studied. The most striking result is that the generation of radiation-induced interface states is nearly eliminated in the nitrided oxides. (8 refs.)

77057 Electron power loss in the (100) n channel of a Si metal-oxide-semiconductor field-effect transistor. I. Intrasubband phonon scattering. C.M.Krowne (Electronics Technol. Div., Naval Res. Lab., Washington, DC, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2441-54 (May 1983). The electron energy relaxation is studied as a function of the 'electron temperature' T_e in the n channel of a (100) surface silicon MOSFET (metal-oxide-semiconductor field-effect transistor) device by inspecting the phenomenological energy relaxation time $\tau_e(T_e)$ at 4.2K, 77K, and 300K lattice temper-

ratures. τ_i is theoretically calculated in order to determine the relative contributions of shear horizontal (SH), pressure-shear vertical (P-SV), shear vertical-pressure (SV-P), total reflection shear vertical pressure (TR), and Rayleigh (R) surface acoustic phonon modes to the electron energy relaxation at the interface. Two-dimensional electron transport is assumed and the effects of subbanding near the interface are included. Only electron scatter events within subbands are studied (intrasubband). This exhaustive study finds that surface modes do not dominate the electron energy relaxation at the Si-SiO₂ interface at $T_i=4.2\text{K}$. Some other mechanism(s) must predominate at $T_i=4.2\text{K}$. (18 refs.)

77058 Electron power loss in the (100) n channel of a Si metal-oxide-semiconductor field-effect transistor. II. Intrasubband phonon scattering. C.M.Krowne (Electronics Technol. Div., Naval Res. Lab., Washington, DC, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2455-67 (May 1983).

For pt.I see ibid., vol.54, no.5, p.2441 (1983). A simple matrix element is used to approximate electron-acoustic phonon scattering between different electron subbands i in the n channel of a (100) surface silicon MOSFET (metal-oxide-semiconductor field-effect transistor) device. This matrix element is used to determine the form of the electron power loss P_{ij} in a $i \rightarrow j$ intersubband transition. P_{10} is calculated for $T_i=4.2\text{K}$ lattice temperature and electron temperatures T_e between 4.4K and 18K when the electron inversion density $N_{\text{inv}}=(3.76-10.0)\times 10^{11}\text{cm}^{-2}$ and an acceptor density $N_A=10^{14}\text{cm}^{-3}$, and compared to Fang and Fowler's (1970) experimental data (which is put into the form of an experimental power loss P_{exp}). This is justified since the total power loss P due to intrasubband scattering as well as other P_{ij} terms besides P_{10} is small. It is found that good to excellent fits between P_{10} and P_{exp} occur by adjusting the separation Δ_{e10} between the lowest two circular subband edges. Δ_{e10} is between 5.2 and 9.4 meV, and the electron-phonon deformation coupling constant $D\approx 3.5\text{eV}$. The values of Δ_{e10} obtained in such a manner roughly agree with Stern's (1972) theoretical self-consistent results. P_{10} is very sensitive to both Δ_{e10} and to the effective mass for motion parallel to the surface m_i with the results implying that $m_i=0.19m_0$ (m_0 =free electron rest mass). If one wants to find the contribution of intersubband scattering to P at higher T_i , the formalism should still be applicable, although the approach could be much more complicated due to the addition of new P_{ij} terms coming from both higher subbands and new scattering agents such as optical modes. (22 refs.)

77059 Effect of silicon orientation and hydrogen anneal on tunneling from Si into SiO₂. Z.A.Weinberg, A.Hartstein (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2517-21 (May 1983).

The issue of transverse momentum conservation in tunneling is examined by photon-assisted-tunneling measurements on metal-oxide-silicon structures. Results are compared for tunneling from silicon of (100), (110), and (111) orientations. The results for (100) and (110) are almost identical. For (111) it is concluded that the interface barrier energy is higher by about 0.5 eV than for (100) samples. This difference exists only for unannealed samples and is almost eliminated by the 400°C standard forming gas (10% H₂, 90% N₂) anneal. The barrier for the (111) interface has therefore a greater sensitivity to hydrogen than for the other two orientations. The experiments and their consistency with the usual (dark) Fowler-Nordheim tunneling from silicon into SiO₂ show that transverse momentum (parallel to the interface) conservation is not observed. (12 refs.)

77060 The electrical behavior of GaAs-insulator interfaces: a discrete energy interface state model. T.E.Kazior, J.Lagowski, H.C.Gatos (MIT, Cambridge, MA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2533-9 (May 1983).

The relationship between the electrical behavior of GaAs metal insulator semiconductor (MIS) structures and the high density discrete energy interface states (0.7 and 0.9 eV below the conduction band) was investigated utilizing photo- and thermal emission from the interface states in conjunction with capacitance measurements. It was found that all essential features of the anomalous behavior of GaAs MIS structures, such as the frequency dispersion and the C-V hysteresis, can be explained on the basis of nonequilibrium charging and discharging of the high density discrete energy interface states. (23 refs.)

77061 Metal/Insulator/Si structures with low interface state density fabricated by combined ion beam sputtering and atomic hydrogen beam treatment. M.Garrigues, R.Blanchet, C.Sibran, P.Viktorovitch (Lab. d'Electronique, Automatique et Mesures Electriques, Ecole Centrale de Lyon, Ecully, France).

J. Appl. Phys. (USA), vol.54, no.5, p.2863-5 (May 1983).

Ion beam techniques, combining insulator deposition and atomic hydrogen treatment, are used for the fabrication of metal-insulator-silicon (MIS) structures at low temperature (300°C). SiN_xO_y and AlN_xO_y insulating layers are deposited by reactively sputtering either a silicon or an aluminum target with a nitrogen ion beam. The y/x ratio is controlled by introducing pure molecular oxygen in the vicinity of the substrate. The resistivity and dielectric strength of the films increase with the y/x ratio and exceed typically $10^{16}\Omega\text{cm}$ and $2\times 10^8\text{V/cm}$, respectively. The electrical properties of the MIS devices were investigated by the capacitance/conductance method. The dramatic reduction of the interface state density (below $10^{11}\text{cm}^{-2}\text{eV}^{-1}$ with AlN_xO_y) consecutive to H treatment and annealing in nitrogen at 300°C, is interpreted on the basis of the formation, weakening, and strengthening of Si-H bonds. (6 refs.)

77062 Characterization of surface states in MOS capacitors by a modified DLTS technique. V.Kumar, S.B.Iyer (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).

Phys. Status Solidi a (Germany), vol.76, no.2, p.637-40 (16 April 1983).

A modified DLTS technique for characterization of surface states in MOS structures is proposed. It involves scanning the bias while applying small filling pulses at constant temperature. The surface states behave as discrete levels when the pulses are small. Results on a Cu-SiO₂-p-Si tunnel diode are presented as example. (15 refs.)

77063 Quantized Hall and transverse resistivities in silicon MOS n -inversion layers. K.Yoshihiro, J.Kinoshita, K.Inagaki, C.Yamanouchi (Electrotech. Lab., Ibaraki, Japan), J.Moriyama, S.Kawaji, *Physica B & C (Netherlands)*, vol.117-118 B-Kwaj, pt.2, p.706-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The results are reported of the quantized Hall and transverse resistivity measurements made on n -channel (100) inversion layers of Si-MOSFET devices at temperatures $T=1.6$ to 0.5K , magnetic fields $H=9.0$ and 10.5T for various excitation current densities. The Hall resistivity ρ_{xy} is found to be integral fractions of h/e^2 in precision better than 0.2ppm over the concentration of electrons $ieH/hc=1\times 10^{12}$ to $3\times 10^{12}/\text{cm}^2$ ($i=4, 8, 12$) at the lowest temperatures. When the transverse resistivity ρ_{xx} is finite in the Hall plateau regions, the deviation in ρ_{xy} is roughly given by $\Delta\rho_{xy}(i)=C\rho_{xx}^{\text{min}}(i)$ where

$C\approx -0.1$. This result is two orders of magnitude as large as that expected from existing theories. (15 refs.)

77064 Electrical characterization of Al-SiO₂-Si (N -type) tunnel structures. Influence of LPCVD and LPO₂ oxide growth technologies on the properties of the Si-SiO₂ interface. G.Pananakakis, G.Kamarinos, M.El-Sayed (Lab. de Phys. des Composants a Semiconducteurs ERA, CNRS, ENSERG, Grenoble, France), V.Le Goascoz.

Solid-State Electron. (GB), vol.26, no.5, p.415-26 (May 1983).

Metal-thin oxide-silicon tunnel diodes are studied. Two kinds of thin oxides (thickness $\delta < 30\text{\AA}$) are examined. The first fabricated by oxidation under low oxygen pressure (LPO₂) at $T\approx 950^\circ\text{C}$. The second fabricated by low pressure chemical vapor deposition (LPCVD) at $T\approx 880^\circ\text{C}$. The influence of thermal annealing of these devices has been studied. (I , V), $C(V, \omega)$ and $G(V, \omega)$ experimental characteristics are analysed and compared with theoretical (I , V) curves issued from a detailed and original model. Interface states energy distribution $N_{\text{SS}}(E)$, surface potential (V_s) vs. applied voltage (V_a), effective affinities (χ_n and χ_p) and oxide thickness homogeneity are deduced. The influence of pinholes is also discussed. It is worth noting the complementarity of experimental results and the theoretical (I , V) simulation. LPCVD oxides after annealing are found to be more homogeneous and provide a lower density $N_{\text{SS}}(E)$ of interface states than LPO₂ thin oxides. (37 refs.)

77065 Dark-capacitance transients in MIS tunnel diodes. W.E.Dahlke, J.A.Shimer (Sherman Fairchild Lab., Lehigh Univ., Bethlehem, PA, USA). *Solid-State Electron. (GB)*, vol.26, no.5, p.465-72 (May 1983).

Dark-capacitance transients in MIS tunnel diodes switched from accumulation to deep depletion depend on the interface state occupancy. This time dependent function is derived and its behavior described for electron emission and electron-hole pair generation with tunneling and thermally controlled occupancies. A new method of determining the tunneling relaxation time constant τ_T from the electron emission transient at low temperature is described. Measurements of MIS tunnel diodes with oxide thickness $d_{\text{ox}}=17$ to 80\AA agree with theory and the resultant values of τ_T compare with previously reported results from photocapacitance. (7 refs.)

77066 Double-injection currents and field effect in sapphire-base silicon p^+nn^+ diodes. V.S.Lysenko, R.N.Litovskii, M.M.Lokshin, M.F.Scherbakova.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.736-41 (May 1983). In Russian.

Investigates current-voltage characteristics of double-injection currents in sapphire-base silicon diodes and estimates efficient lifetime and bipolar length of diffusion for electron-hole pairs. Transverse anisotropy of conduction is shown insignificant for double-injection currents. It is also experimentally proved possible to control double-injection currents by the field effect. Strong fields exhibit an injection break-down due to current carrier heating. (10 refs.)

73.40R Metal-insulator-metal structures

77067 Photoresponse characteristics of thin-film nickel-nickel oxide-nickel tunneling junctions. R.G.Marshalek (Dept. of Electrical Engng., & Computer Sci., Johns Hopkins Univ., Baltimore, MD, USA), F.M.Davidson.

IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.743-54 (April 1983).

Photoinduced tunneling currents in thin-film Ni-NiO-Ni tunneling junctions were measured as a function of photon energy over the range $2.0\text{eV}\leq h\nu\leq 2.7\text{eV}$. The photoresponse mechanism was found to be consistent with a photon assisted tunneling mechanism. Inelastic electron-electron collisions were found to strongly influence the photoassisted tunneling currents. (53 refs.)

77068 Temperature dependence of voltage controlled negative resistance in an electroformed Cu-SiO₂-Cu structure. S.A.Y.Ali-Ismael, C.A.Hogarth (Dept. of Phys., Brunel Univ., Uxbridge, England).

Phys. Status Solidi a (Germany), vol.76, no.2, p.559-63 (16 April 1983).

Measurements of voltage-current characteristics as functions of temperature are described for electroformed thin film structures of Cu-SiO₂-Cu over the temperature range 24 to 95°C . The results are consistent with a model in which the filaments which bridge the insulator as a consequence of the forming process are essentially metallic in nature, the temperature coefficient of resistance being shown to be positive. (15 refs.)

73.60 ELECTRONIC PROPERTIES OF THIN FILMS

77069 Galvanomagnetic properties of thin inhomogeneous films. B.Ya.Balagurov.

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1988-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3492-4 (Nov. 1982).

[received: May 1983]

Applies the theory of an effective medium (TEM) to the galvanomagnetic properties of two-dimensional two-component media (thin films) in a transverse magnetic field H . The author finds an analytic solution of the equations by the TEM method, which has the same form as the exact solution. At a critical carrier density this solution reduces to the Dykne result (1970). The author also determines the conditions which restrict the application of the TEM method (for a sample with an arbitrary carrier density) to the problem under discussion: the first condition is that the conductivities of the two components should not differ too greatly and the second that the magnetic field H cannot exceed a certain maximum value. (5 refs.)

73.60D Metallic thin films

77070 Temperature coefficient of the resistance of chromium-copper alloy films. A.R.Patel, G.K.Shivakumar (Dept. of Phys., Sardar Patel Univ., Gujarat, India), N.C.Pandya, N.C.Chourasia.

Mater. Lett. (Netherlands), vol.1, no.5-6, p.181-3 (April 1983).

The temperature coefficient of the resistance of chromium-copper films has been measured in the thickness range 500-4900 \AA from 33 to 190°C . It is observed that the Fuchs-Sondheimer theory explains the observed thickness dependence satisfactorily. The mean free path of the conduction electrons and the TCR of an infinitely thick film have been computed as 363\AA and $2.886\times 10^{-3}\text{C}^{-1}$ respectively at 33°C . A linear variation of the reciprocal mean free path with temperature has also been established. (8 refs.)

77071 Electrical characteristics of thin Ni_2Si and NiSi_2 layers grown on silicon. E.G.Colgan, M.Maenpaa, M.Finetti, M.-A.Nicolet (California Inst. of Technol., Pasadena, CA, USA). *J. Electron. Mater.* (USA), vol.12, no.2, p.413-22 (March 1983). The authors have determined the resistivity, carrier concentration, and Hall mobility as a function of thickness (700-3000 Å) of Ni_2Si , NiSi and NiSi_2 layers formed by vacuum annealing at 270-300°C, $\approx 400^\circ\text{C}$ and $\approx 800^\circ\text{C}$, respectively, of nickel films vacuum-deposited on a silicon substrate ($\langle 111 \rangle$ n-type and $\langle 100 \rangle$ p-type Si $\rho \approx 1 \text{ K}\Omega$). The layer thicknesses were measured by 2 MeV $^4\text{He}^+$ backscattering spectrometry. The silicide phase was confirmed by X-ray measurements. The electrical measurements were carried out using the van der Pauw configuration. The electrical transport parameters are independent of the film thickness within the experimental uncertainty. The Hall factors were found to be unity. The majority carriers are electrons in NiSi and holes in Ni_2Si and NiSi_2 . (16 refs.)

73.60F Semiconductor films

77072 The density of states in DC glow discharge deposited a-Si:H from Schottky barrier diode admittance measurements. P.K.Jain, R.V.Kruzelecky, S.Zukotynski (Dept. of Electrical Engng., Univ. of Toronto, Toronto, Ontario, Canada).

Can. J. Phys. (Canada), vol.61, no.5, p.736-43 (May 1983).

An experimental and theoretical study of the admittance of a-Si:H Schottky barrier diodes versus frequency, temperature, and voltage is presented. A full numerical analysis of the admittance of the Schottky diode with an arbitrary density of states (DOS) distribution is given. It is based on a general model using an equivalent circuit of the devices. The analysis takes into account the thermal response time of gap states as well as the transport of carriers. The DOS distribution near the Fermi level is determined for diodes prepared using direct current glow discharge deposited a-Si:H. It is shown from the admittance study that the thermionic theory is appropriate to describe the transport of electrons across the junction. The occupancy of bulk states is controlled mainly by the interaction kinetics of these states with the electrons in the conduction band and not by transport of these electrons. (11 refs.)

77073 Electrical and optical properties of SnO_2 thin layers received using the method of oxidation of thermally vapoured Sn layers. A.Klos, M.Romanis, E.Zalewski.

Pr. Ośrodka Badańczo-Rozwojowego Przetwornikow Obrazu (Poland), no.2, p.29-38 (1982). In Polish.

The work includes description of electrical and optical properties of transparent, conductive SnO_2 thin layers. Thermally evaporated Sn layers were oxidized at temperature 300-350°C in the flow of oxygen under atmospheric pressure. SnO_2 layers of transmission 0.6-0.9 in the region of $\lambda = 300\text{-}360 \text{ nm}$ and resistance per square of approximately 250 Ω were obtained. (11 refs.)

77074 The effect of hydrogen on the electrical properties of n-type $\text{Pb}_{0.9}\text{Cd}_{0.1}\text{Te}$ thin films. A.L.Dawar, C.Jagadish, K.V.Ferdinand, P.Kumar, P.C.Mathur (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).

J. Phys. & Chem. Solids (GB), vol.44, no.5, p.453-5 (1983).

Measurements of the Hall coefficient and the DC conductivity were made on flash evaporated n-type $\text{Pb}_{0.9}\text{Cd}_{0.1}\text{Te}$ epitaxial films exposed to molecular hydrogen gas at high pressures (up to 500 psi) in the temperature range 77-300K. It has been found that the effect of hydrogen on the films is to reduce the concentration of the extrinsic carriers and to increase their mobility. It is believed that hydrogen gas removes cadmium ions and neutral cadmium atoms from these films. (26 refs.)

77075 Photoelectric fatigue of photoresistors based on polycrystalline $\text{CdS}:\text{Cu}:\text{Cl}$ films. T.B.Torchinskaya, L.N.Baidokha, L.F.Zharovskii, M.Ya.Rakhlin.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.589-95 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.821-7 (May 1982). [received: Feb. 1983]

In order to study further the phenomenon of photoelectric fatigue of polycrystalline photoresistors and to clarify its mechanism, the authors investigated the photoluminescence and excitation spectra, the photocurrent spectra at 77K, and the thermally stimulated conductivity (TSC) of photoresistors based on $\text{CdS}:\text{Cu}:\text{Cl}$ polycrystalline films in the range 4.2-400K. (22 refs.)

77076 Influence of nitrogen ion implantation on the electrical transport properties of InTe and InSe thin films. D.V.Krishna Sastry, P.Jayarama Reddy (Dept. of Phys., Sri Venkateswara Univ., Tirupati, India).

Phys. Status Solidi a (Germany), vol.76, no.1, p.345-50 (16 March 1983).

Amorphous and crystalline thin films of InTe and InSe are prepared by the discrete evaporation of the materials from a tantalum boat. Electrical conductivity and mobility are measured on these films. The films are implanted with nitrogen ions, with varying ion dosages and their electrical conductivity and mobility are measured again. The results show that the electrical conductivity and mobility are lowered on ion implantation, more so, when the ion dosage is high. This is explained in terms of the lattice damage caused by the bombardment of the energetic incident ion. The films are restored back partially to their original state by thermal annealing as observed from the conductivity and mobility data. (17 refs.)

77077 Effect of laser irradiation on the electrical properties of polycrystalline thin films of tellurium. G.P.Srivastava, K.N.Tripathi, N.K.Sengal (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).

Phys. Status Solidi a (Germany), vol.76, no.2, p.K137-40 (16 April 1983). Polycrystalline thin films of tellurium have been irradiated with a pulsed Q-switched ruby laser. DC conductivity and Hall effect studies that the irradiated films have lower values of free carrier concentration and higher values of Hall mobility. (19 refs.)

74.00 SUPERCONDUCTIVITY

74.10 OCCURRENCE, CRITICAL TEMPERATURE

77078 Low-temperature transport properties of RERh_2B_4 compounds (RE=Sm, Ho, Er, Lu). W.Odoni, H.R.Ott (Lab. fur Festkorperphys., ETH-Honggerberg, Zurich, Switzerland), M.B.Maple.

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.505-33 (June 1983).

The authors have measured the low-temperature electrical resistivity ρ and thermal conductivity λ of a selection of RERh_2B_4 compounds. The compound LuRh_2B_4 served as the standard material concerning superconductivity and HoRh_2B_4 as that for magnetic ordering. For ErRh_2B_4 they studied, in particular, the transition from the superconducting to the normal state with decreasing temperature. In SmRh_2B_4 both $\rho(T)$ and $\lambda(T)$ reveal the strong interaction between the magnetic moments of the Sm^{3+} ions and the conduction electrons, which is partly quenched at the transition to the antiferromagnetic state. Depending on the material considered, the thermal conductivity data are analyzed using theoretical calculations due to Bardeen et al. (1958); Kadanoff and Martin (1961); and Ambegaokar and Griffin (1964). (46 refs.)

77079 Influence of impurity scattering on the critical temperature of superconductors with a partial gap in the electron spectrum. A.M.Gabovich (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR), A.S.Shpigel.

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.581-99 (June 1983).

The influence of the scattering potential of nonmagnetic and magnetic impurities on the critical superconducting transition temperature T_c is considered for superconductors with either a completely or partially dielectric electron spectrum. It is shown that T_c rises with increasing concentration of nonmagnetic impurities, i.e. the Anderson theorem is violated in such systems. Magnetic impurity scattering lowers T_c . However, this reduction is weakened compared to usual superconductors, due to the presence of the dielectric gap on the Fermi surface. (51 refs.)

77080 Superconductivity and magnetism in the pseudoternary system $\text{Dy}(\text{Ru}, \text{Rh}_{1-x})_2\text{B}_4$. H.C.Hamaker, M.B.Maple (Inst. for Pure & Appl. Phys. Sci., Univ. of California, San Diego, La Jolla, CA, USA).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.633-53 (June 1983).

The pseudoternary system $\text{Dy}(\text{Ru}, \text{Rh}_{1-x})_2\text{B}_4$ has been studied by means of AC magnetic susceptibility, electrical resistance, heat capacity, static magnetic susceptibility, and magnetization measurements. A low-temperature phase diagram was determined for the range of concentrations $0.1 < x \leq 1$. Superconductivity occurs for $x \leq 0.35$, with a sharp depression of the superconducting critical temperature near $x \approx 0.3$. Long-range magnetic order exists for all concentrations x ; the rhodium-rich compounds exhibit antiferromagnetism while the ruthenium-rich compounds are ferromagnetic. Pseudoternary compounds near the critical limit possibly exhibit reentrant antiferromagnetic superconductivity, a hitherto unobserved phenomenon. The competition between antiferromagnetism and ferromagnetism apparently leads to a mixed phase in a comparatively wide range of concentrations. (42 refs.)

77081 A new superconducting metal glass $\text{Mo}_{70}\text{Ge}_{20}\text{B}_{10}$. Liu Zhiyi, Zhao Zhongxian, Yang Dayu, Wang Chaoguo (Inst. of Phys., Acad. Sinica, Beijing, China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.2, p.170-2 (Feb. 1983).

The authors use a rapid liquid quench method to prepare the amorphous transition metal-metalloid system, $\text{Mo}_{70}\text{Ge}_{20}\text{B}_{10}$. The samples were analyzed by X-ray, electron microscopy and differential thermal analysis. (9 refs.)

77082 Thermal-relaxation studies of the stability of amorphous structures in zirconium-based superconducting alloys. S.J.Poon (Dept. of Phys., Univ. of Virginia, Charlottesville, VA, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5519-25 (1 May 1983).

The superconducting transition temperature T_c of amorphous $\text{Zr}_2\text{X}(\text{X}=\text{Co}, \text{Ni}, \text{Pd})$ and $\text{Zr}_3\text{X}(\text{X}=\text{Ni}, \text{Pd}, \text{Rh})$ alloys annealed isothermally below their crystallization temperatures is studied as a function of annealing time (up to ~ 20 -100 h). Upon annealing, T_c is always found to decrease below its value in the as-quenched state. The major portion of T_c depression is attributed to the relaxation of 'quenched-in' strains. Alloys of Zr_2Co , Zr_2Ni , Zr_2Pd , and Zr_3Rh which undergo polymorphous crystallization (P alloys) show trends of saturation in T_c . On the other hand, for Zr_3Ni and Zr_3Pd alloys which crystallize eutectically (E alloys), saturation in T_c is only observed at relatively low annealing temperatures over rather short intervals of annealing time. The results are attributed to the stability and instability of the 'equilibrium' amorphous structures in the P and E alloys, respectively. It is conjectured that instability in the E alloys leads to initial microscopic phase separation, the homogeneity of which is evidenced by results of transition width and flux pinning measurements. All homogeneous samples exhibit very weak flux-pinning force of about 10^4 N/m² at 1.5K. Prolonged annealing of E alloys leads to eutectic decomposition. Predictions derived from a simple 'proximity-effect' model are consistent with the present findings. (28 refs.)

77083 Critical fields of liquid superconducting metallic hydrogen. J.Jaffe, N.W.Ashcroft (Lab. of Atomic & Solid State Phys. & Materials Sci. Center, Cornell Univ., Ithaca, NY, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5852-5 (1 May 1983).

Liquid metallic hydrogen, in a fully dissociated state, is predicted at certain densities to pass from dirty to clean and from type-II to type-I superconducting behavior as the temperature is lowered. (18 refs.)

77084 Superconducting properties of tellurium at high pressure. M.A.Irina (Inst. of Phys. of High Pressures, Acad. of Sci., Troitsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1954-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3439-41 (Nov. 1982). [received: May 1983]

An investigation of the dependence $T_c(P)$ of tellurium revealed that in the range of pressures P from 15.0 to 30.0 GPa the value of T_c changed from 3K to 6.5 \pm 0.6K. The results reported indicated that, beginning from $P\sim 8.6$ GPa, the superconducting transition temperature T_c of tellurium measured at a given pressure, depended strongly on the initial carrier density. (15 refs.)

77085 Preparation, physical properties, and superconductivity of $\text{La}_{2-x}\text{S}_4$ films. L.V.Mel'nikova, D.P.Moisev, V.M.Postnikov (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1985-6 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3487-9 (Nov. 1982). [received: May 1983]

The evaporated layer deposition of $\text{La}_{2-x}\text{S}_4$ superconducting films is described. The optical absorption and the film structure are studied with electron diffraction. The films exhibited a superconducting transition at 6K. (10 refs.)

77086 Increasing the critical properties of superconducting molybdenum sulfides by hydrogen absorption. N.E.Alekseievskii, A.V.Mitin (Inst. of Phys. Problems, Acad. of Sci., Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.443-4 (Sept. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1029-32 (Sept. 1982). [received: May 1983]

Molybdenum sulfides of the composition $\text{A}_x\text{Mo}_{6-y}\text{S}_8$ ($\text{A}=\text{Pb}, \text{Sn}, \dots$) are among the most promising superconductors for applications. Some of them ($\text{Pb}_x\text{Mo}_{6-y}\text{S}_8$, for example) exhibit in addition to record high values of the second critical field, $H_{c2}(4.2\text{K})\approx 500$ kOe—high critical temperatures, $T_c\approx 14$ -15K, and high critical current densities, $J_c(T=1.7\text{K}, H=100$ kOe) $\approx 5\cdot 10^4$ A/m². The authors report data on the effect of hydrogen on the properties of ternary and multicomponent sulfides of molybdenum. The critical properties and the temperature dependence of the resistivity $\rho(T)$ were measured for bulk samples in the form of hollow cylinders with an outside diameter of 5 mm, an inside diameter of 2 mm, and a length of 16-18 mm. The values of J_c were determined by a contactless method, from the difference between the magnetic fields inside and outside the sample. Curves of the transition to the superconducting state were recorded by the standard four-contact potentiometer method from the change in the resistance. (7 refs.)

74.20 THEORY

77087 Equations of superconductivity for transition metals in the Wannier representation. G.M.Vujcic, A.L.Kuzemskii, N.M.Plakida (Joint Inst. for Nuclear Res., Dubna, USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.1035-40 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.138-45 (Oct. 1982).

In the Wannier representation, a system of equations for superconductivity is obtained for strongly bound electrons in a transition metal, which is described by the Hubbard Hamiltonian. The electron-phonon interaction is written down using the rigid-ion model. A closed system of equations is obtained when the renormalization of the vertex in the mass operator is ignored. (28 refs.)

77088 A new semiempirical formula for superconducting transition temperatures of metals and alloys. M.Surma (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).

Phys. Status Solidi b (Germany), vol.116, no.2, p.465-74 (1 April 1983).

A new formula describing the superconducting transition temperature is presented. The electron-phonon coupling constant λ and the phonon frequency spectrum parameters of a material are the quantities which define the transition temperature T_c of superconductors. A comparison between the experimental and calculated values of T_c for metals and alloys confirms the validity of the new formula. (25 refs.)

74.30 GENERAL PROPERTIES

77089 Some remarks about surface effects in magnetic superconductors. M.Fusco Girard, F.Mancini (Istituto di Fisica, Univ. di Salerno, Salerno, Italy).

Phys. Lett. A (Netherlands), vol.95A, no.8, p.447-50 (23 May 1983).

A new choice for the boson transformation function is employed for the study of the electromagnetic-field distributions at the interface of vacuum with a magnetic superconductor. The relation with previous approaches is discussed. (8 refs.)

74.30E Thermodynamic properties; thermal conductivity

77091 Specific heat jump for superconducting virtual bound state alloys. Y.Okabe, A.D.S.Nagi (Univ. of Waterloo, Waterloo, Ontario, Canada).

Solid State Commun. (USA), vol.46, no.8, p.639-41 (May 1983).

Using the Anderson model in the non-magnetic limit, the authors have calculated the jump in specific heat at T_c (ΔC), for superconducting virtual bound state alloys. It is found that the normalized (ΔC) vs. normalized T_c curves deviate considerably from the BCS value. A more significant result of the present study is that the initial slope of such a curve has a maximum value of 3.638. It is the highest value reported in literature for the impurity problem and is much larger than obtained even in a large pair breaking situation like the Kondo effect (2.481). (10 refs.)

74.30G Response to electromagnetic fields, nuclear magnetic resonance, ultrasonic attenuation

77092 Longitudinal ultrasonic attenuation in normal and superconducting lead at low temperatures. S.Sathish, K.Samudravajaya, B.K.Basu (Tata Inst. of Fundamental Res., Bombay, India).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.423-32 (May 1983).

The authors have measured longitudinal ultrasonic attenuation along the $[110]$ direction in normal and superconducting states in two single crystals of lead, one made from high-purity lead and the other made with high-purity lead doped with 0.1 at.% gold. In both specimens an amplitude-dependent effect in the superconducting state has been observed. The data have been taken in the frequency range from 12 to 108 MHz. In high-purity lead the amplitude-independent ratio α_s/α_n shows the frequency dependence observed

by Randorff and Marshall (1970) whereas in the doped specimen this ratio shows a very small spread with frequency. In both specimens deformation does not change the α_s/α_n ratio appreciably. (10 refs.)

77093 Nonselective effect of electromagnetic radiation on a superconducting film in the resistive state. E.M.Gershenzon, M.E.Gershenzon, G.N.Gol'tsman, A.D.Semenov, A.V.Sergeev (V.I. Lenin Moscow Pedagogical Inst., Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.26, no.7, p.296-9 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.244-7 (5 Oct. 1982). [received: May 1983]

The quasiparticle-heating effect of electromagnetic radiation on a niobium superconducting film in the resistive state is nonselective over a broad frequency range, from 10^{10} to 10^{13} Hz. The role played by electron-electron collisions in shaping the nonequilibrium quasiparticle distribution function is discussed. (4 refs.)

77094 Far-infrared conductivity and anomalous below-gap absorption in superconducting granular NbN. D.R.Karecki, G.L.Carr, S.Perkowitz (Phys. Dept., Emory Univ., Atlanta, GA, USA), D.U.Gubser, S.A.Wolf. *Phys. Rev. B (USA)*, vol.27, no.9, p.5460-6 (1 May 1983).

The far-infrared ($100\text{--}1000\text{ cm}^{-1}$) complex conductivity of superconducting granular NbN films has been determined from reflection and transmission data. Moderately granular films, with $R_{\square}=150$ and $200\ \Omega/\square$, followed Leplae-modified Bardeen-Cooper-Schrieffer theory predictions with no absorption below the gap frequency ω_g . The derived values of $2\Delta/kT_c$ were 3.8 and 4.0, slightly below the results for homogeneous films. Highly granular films, with $R_{\square}\geq 500\ \Omega/\square$, displayed DC resistive tails and evidence of Josephson coupling. The real part of the far-infrared conductivity was BCS-type for frequencies above ω_g but showed an anomalous absorption below ω_g . This excess absorption may arise from two-dimensional fluctuations in the form of vortices or from normal conducting regions mixed in with the superconducting grains. (25 refs.)

Nature of dislocation hysteresis losses and nonlinear effect in lead at high vibration amplitudes See Entry 76449

74.40 FLUCTUATIONS AND CRITICAL EFFECTS

77095 Fluctuation conductivity of tin films below the superconducting transition temperature. R.S.Parashar, P.N.Dheer (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.249-55 (May 1983). Measurements have been carried out of the temperature dependence of the fluctuation-induced excess electrical conductivity of thin (thickness much less than the Ginzburg-Landau coherence length) superconducting films of tin below the transition temperature. Two types of specimen were investigated: (a) films deposited on a glass substrate held at 300K and (b) films deposited on a glass substrate at 300 K and then covered by a protective layer of germanium. Special care was taken to ensure sample homogeneity. Analysis of the results shows that the fluctuation parameter, ϵ_0 , is not affected by the germanium layer. Its value is, however, much larger than that predicted by the theory of Kajimura (1971) et al. (17 refs.)

77096 Effect of a magnetic field on the specific heat jump of a superconducting alloy containing paramagnetic impurities with local states within the gap. B.Sihota, A.D.S.Nagi (Univ. of Waterloo, Waterloo, Ontario, Canada). *J. Low Temp. Phys. (USA)*, vol.51, no.3-4, p.347-68 (May 1983).

The effect of a uniform magnetic field on the specific heat jump $\Delta\tilde{C}$ of a superconductor containing paramagnetic impurities has been investigated. The impurities are described by the Shiba-Rusinov model. Taking the normalized position of the bound state within the BCS gap $\epsilon_0=0.8$ and 0.0 and the parameter $\alpha(=\langle S_z^2 \rangle/S^2)=1.0$ and $1/3$ as typical values, the authors find the detailed dependence of $\Delta\tilde{C}$ on the impurity concentration \tilde{c} and the transition temperature T_c . In some cases $\Delta\tilde{C}$ diverges at certain values of \tilde{c} or T_c signaling a change of the normal-superconductor phase transition from second order to first order. (25 refs.)

77097 Quantum fluctuations in quasi-one-dimensional superconductors. H.J.Schulz (Inst. Laue-Langevin, Grenoble, France), C.Bourbonnais. *Phys. Rev. B (USA)*, vol.27, no.9, p.5856-9 (1 May 1983).

A model for the low-temperature properties of quasi-one-dimensional superconductors, including quantum effects is investigated. Both long-range Coulomb effects and scattering by nonmagnetic impurities enhance quantum effects. For strong quantum fluctuations the transition from a fluctuating to a long-range-ordered superconducting state obeys Bardeen-Cooper-Schrieffer-like thermodynamic relations. Application to the tetramethyltetraselenafulvalene-X (TMTSF)_x class of compounds is discussed. The authors' results also apply to other quasi-one-dimensional systems. (23 refs.)

Far-infrared conductivity and anomalous below-gap absorption in superconducting granular NbN See Entry 77094

74.50 PROXIMITY EFFECTS, TUNNELLING PHENOMENA, AND JOSEPHSON EFFECT

77098 Dynamics of accelerated Josephson junctions. P.Russer (Lehrstuhl für Hochfrequenztech., Tech. Univ. München, München, Germany). *Arch. Elektron. & Übertragungstechnik. (Germany)*, vol.37, no.5-6, p.153-9 (May-June 1983).

The generally covariant sine-Gordon equation for arbitrarily shaped large-area Josephson junctions is established. The dynamics of rotating ring-shaped Josephson junctions is investigated. It is shown that solitons have a tendency to conserve their motion with respect to the inertial frame of reference. Possible applications for inertial rotation sensing are discussed. (20 refs.)

77099 Niobium thin-film point-contact Josephson junction. S.Naito, Y.Higashino, M.Ibuka (Yokogawa Electric Works, Tokyo, Japan). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2866-8 (May 1983).

A stable, niobium thin-film point-contact Josephson junction can be fabricated using RF magnetron sputtering and electron beam lithography. Constant-voltage steps based on a AC Josephson effect are observed up to a voltage level of 4 mV at 4.2K when a 9-GHz microwave signal is applied. This voltage level is the highest for any thin-film weak link except for the tunnel junction. (13 refs.)

77100 Odd and even subharmonics and chaos in RF SQUIDS. R.K.Ritala (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland), M.M.Salomaa. *J. Phys. C (GB)*, vol.16, no.14, p.L477-84 (20 May 1983).

The authors discuss multistable RF SQUIDS under weak damping, driven by an external flux applied at resonance frequency. Rich subharmonic spectra and several bands of chaotic behaviour are found as functions of the amplitude of the drive. In addition to period-doubling Feigenbaum sequences, they

also encounter an odd subharmonic route to the phase-unlocked regime. The principal chaotic band displays new intrinsic structure, which arises due to an abrupt symmetry break from an orbit with period-5 character to one resembling a period-2 orbit. However, at higher amplitudes of the drive, the symmetry becomes continuously restored. (23 refs.)

77101 The superconductive energy gaps of thin-film AuAl₂ and AuIn₂. D.Van Vechten, L.B.Holdeman, R.J.Soulen, Jr., J.Toots (Center for Absolute Phys. Quantities, NBS, Washington, DC, USA).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.329-46 (May 1983). Thin films of the intermetallic compounds AuAl₂ and AuIn₂ were prepared and used as electrodes in AuAl₂/oxide/Al, Al/oxide/AuIn₂ or AuAl₂/oxide/AuIn₂ tunnel junctions. The tunnel barriers were produced by RF sputter oxidation. The temperature dependence of the energy gaps of the AuAl₂ and AuIn₂ films was measured and found to agree well with BCS theory. (13 refs.)

77102 High-frequency impedance of superconducting tunnel junctions. D.G.Jablonski (Naval Surface Weapons Center, Silver Spring, MD, USA).

J. Low Temp. Phys. (USA), vol.51, no.3-4, p.433-51 (May 1983). Comparison is made between the high-frequency impedance of a Josephson tunnel junction predicted by the RSJ model and that predicted by the Werthamer theory (1966). Results obtained analytically, numerically, and by electronic simulation illustrate several fundamental differences between the two models. In particular, the small-signal RF resistance of a tunnel junction described by the Werthamer theory exhibits strong variations with temperature and frequency. In addition, the Werthamer theory predicts that a tunnel junction will have a plasma-like resonance in the absence of any electrode capacitance; and that the junction can have a nonzero reactance when current-biased outside of a constant-voltage step. (19 refs.)

77103 Thermoelectric effects in a superconducting bimetallic loop: superconductors in relative motion: comment on a paper by Ginzburg, Zharkov and Sobyenin. G.R.Pickett (Dept. of Phys., Univ. of Lancaster, Lancaster, England).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.561-8 (June 1983). For paper see V.L. Ginzburg et al., *ibid.*, vol.47, p.427 (1982). The problem of the response of a bimetallic superconducting loop to a normal thermoelectrically generated quasiparticle current in one arm is considered from the point of view of superfluids in relative motion. The recent conclusions of Ginzburg et al. are shown to be invalid. (5 refs.)

77104 Specific heat discontinuity of a proximity-effect sandwich system containing Kondo impurities. S.Yoksan (Dept. of Phys., Srinakharinwirot Univ., Bangkok, Thailand).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.569-79 (June 1983). The theoretical work of Matsuura et al. (1977) on the Kondo effect in superconductors and McMillan's (1968) tunneling model are applied to a proximity-effect sandwich system containing Kondo impurities. Analytic expressions for the renormalized Green's functions of superconducting and normal-metal electrons are given as functions of the system composition. It is found that as the thicknesses become large, the specific heat discontinuity changes continuously from the Muller-Hartmann-Zittartz (1971) value for the magnetic cases to the Ichinose (1977) value for the nonmagnetic ones. For small values of the layer thickness, and with the films in proximity, the results can be used to calculate the specific heat jump at the transition temperature numerically. (14 refs.)

77105 Switching process between bistable positions of multiquantum flux tubes in a thin-film type I superconductor. J.Parisi, R.P.Huebener, B.Muhlemaier (Phys. Inst. II, Univ. Tübingen, Tübingen, Germany).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.655-77 (June 1983). A superconducting memory device based on a bistable vortex position represents an interesting storage medium for future Josephson computers. In order to study the operational mode of such a single-flux quantum-memory cell, the authors use a model system multiquantum flux tubes in a thin-film type I superconductor (Pb). By employing high-resolution stroboscopic magnetooptical flux detection, they are able to globally visualize both spatial and temporal behavior of rapidly switching individual flux tubes. All experimental results agree reasonably well with theoretical model considerations of the energy balance during the elementary switching process. (38 refs.)

77106 Tunneling of current carriers in niobium nitride junctions. G.P.Motulevich, D.R.Dzhuraev, E.A.Antonova, V.A.Sukhov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR)

JETP Lett. (USA), vol.36, no.9, p.381-4 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.313-16 (5 Nov. 1982). [received: June 1983]

The characteristics $\sigma_c(V)$ and $d\sigma_c(V)/dV$, where σ_c is the even part of the conductivity of a tunnel junction, are investigated for NbN-I-Pb and NbN-I-Ag(I) (I is an Nb oxide) junctions in the voltage range $V-(\Delta_{\text{NbN}}+\Delta_{\text{Pb}})/e=0-30$ meV and $V-\Delta_{\text{NbN}}/e=0-31$ meV, respectively (Δ_{NbN} and Δ_{Pb} are the superconducting energy gaps). The positions of peaks in the electron-phonon interaction (EPI) function are determined in the energy range 0-26 meV. (6 refs.)

77107 Macroscopic quantum tunnelling effects. G.Schon. *Phys. Bl. (Germany)*, vol.39, no.5, p.124-5 (May 1983). In German.

Considers possible quantum mechanical tunnelling in macroscopic systems, where infinite tunnelling times would result. Possible environmental damping is mentioned and reference is made to a Josephson Tunnel Contact which would consist of two superconductors, separated by an oxide layer. The superconductivity current, based on Cooper Pair tunnelling, is compared with normal particle current and displacement current, a barrier potential diagram is shown and masking by noise effects is predicted. (5 refs.) *G.M.E.*

77108 Fluxon propagation and Fiske steps in long Josephson tunnel junctions. S.N.Erne, A.Ferrigno (Phys. Tech. Bundesanstalt, Inst. Berlin, Berlin, Germany), R.D.Parmentier.

Phys. Rev. B (USA), vol.27, no.9, p.5440-6 (1 May 1983).

The dynamical behavior of fluxons propagating in the presence of an applied magnetic field on an overlap-geometry Josephson tunnel junction of length $5\lambda_J$ having a McCumber $\beta_c=5\pi$ is studied by numerical integration of the circuit equations of a 50-section lumped RSJ-type (resistive shunted junction) model. Resonant propagating configurations corresponding to the first and third Fiske steps are found. The fundamental frequencies and power levels of the radiation emitted from one end when the junction is biased on the first and third Fiske steps and on the first zero-field step are comparable, but a magnetic field renders the power spectra at the two ends of the junction different. (18 refs.)

77109 Free vortex-antivortex states in hollow cylindrical Josephson tunnel junction. M.Kuwada, Y.Onodera, Y.Sawada (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).

Phys. Rev. B (USA), vol.27, no.9, p.5486-90 (1 May 1983). With the use of a hollow cylindrical Nb-Nb₂-Sn Josephson tunneling junction, dynamic vortex motion was studied by the flux-flow voltage across the junction. The junction voltage versus applied axial magnetic field characteristics

in the presence of the axial trapped flux in the junction showed the first evidence for the free vortex and antivortex trains moving in opposite directions and passing through each other. (10 refs.)

77110 Role of pinning in microbridges made from superconductors with A15 lattice. A.N.Lykov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1905-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3353-60 (Nov. 1982). [received: May 1983]

The pinning effect is used as the basis for analyzing of bridge contacts made from superconductors with the A15 lattice. The occurrence, in microbridges of this type, of phenomena characteristic of Josephson contacts is explained. The temperature dependence of the critical field is also accounted for. Current-voltage characteristics of the bridges in autonomous operation are calculated. Good agreement between the calculated and observed characteristics is found. The theoretical model proposed is applicable to broad microbridges made from any type II superconductors. (18 refs.)

77111 Multiple tunneling in granular three-dimensional $\text{BaPb}_{1-x}\text{Bi}_x\text{O}_3$. N.A.Belous, A.M.Gabovich, I.V.Lezhenko, D.P.Moisev, V.M.Postnikov, S.K.Uvarova (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.463-4 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1075-8 (Sept. 1982). [received: May 1983]

The authors studied the voltage-current characteristics of samples to the superconducting ceramic $\text{BaPb}_{0.75}\text{Bi}_{0.25}\text{O}_3$, which undergoes a diffuse transition to the superconducting state, and the effect of a microwave field on these characteristics. Samples with dimensions of $5 \times 2 \times 1$ mm and a critical temperature $T_c \approx 10\text{K}$, corresponding to the beginning of the transition, were held at $T = T_c + 4.2\text{K}$ and connected in a current-source circuit. The width of the transition was 2K . (14 refs.)

74.55 TYPE-I SUPERCONDUCTIVITY

77112 Voltage-current characteristics of a regular system of weakly coupled superconducting particles. V.N.Bogomolov, V.V.Zhuravlev, A.I.Zadorozhnyi, E.V.Kolla, Yu.A.Kumzerov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

JETP Lett. (USA), vol.36, no.8, p.365-7 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.298-300 (20 Oct. 1982). [received: June 1983]

The voltage-current characteristic of a regular system of identical, weakly coupled superconducting particles has been studied for a sample covered by a metal film. Near T_c , an inverse hysteresis is found, i.e. the current corresponding to the return to the superconducting state is higher than the critical current for the disruption of superconductivity. When samples with clean surfaces are used as both source and detector, they influence each other; i.e. there is a stimulation of superconductivity. (5 refs.)

77113 Lifetimes of superheated and supercooled phases in tin on transition from a normal to a superconducting state and vice versa. G.V.Ermakov, N.L.Sorokin (Div. of Physicotech. Problems in Energetics, Acad. of Sci., Sverdlovsk, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.12, p.2086-9 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3663-9 (Dec. 1983).

A method was developed for measuring the lifetimes of metastable phases appearing in the course of a transition from a normal metal to a type I superconductor. Three tin samples differing in respect of the structure and the cleanliness of the surface finish were investigated. The metastable states (superheating or supercooling) were obtained by a rapid change of the magnetic field intensity at a given temperature. A frequency meter was used to determine the time from the moment of establishment of a field to the transition of a sample to a more stable state, which was deduced from the Meissner-Ochsenfeld effect. The experimental results indicated that the lifetime varied randomly from one experiment to another. There was some deviation from the exponential distribution law. Measurements were made of the average lifetime of superheated and supercooled phases as a function of the magnetic field intensity at temperatures 3.6, 3.2, and 2.8K. The dependence on the magnetic field was nonmonotonic, there was a limit to superheating in a superconducting state corresponding to zero lifetime, but there was no such limit in the case of supercooling. The maximum superheating fields found from the Ginzburg-Landau theory were in good agreement with the experimental results. The theoretical values of the maximum supercooling fields were in the region of one of the minima of the investigated dependence. (28 refs.)

74.60 TYPE-II SUPERCONDUCTIVITY

77114 Scaling law in voltage-current characteristics of hard superconductors. I.Hlasnik, S.Takacs (Electrotech. Inst., Slovak Acad. of Sci., Bratislava, Czechoslovakia).

Cryogenics (GB), vol.23, no.6, p.314-16 (June 1983).

From scaling laws for pinning the authors have suggested scaling laws for voltage-current characteristics of type II superconductors. After linearization of J_c dependence on magnetic field B , temperature T and stress ϵ , they lead to exponential dependence of the voltage E on these parameters. In order to obtain general scaling laws, then the temperature, field and stress dependence of the denominator J_0 in $E = E_0 \exp \{ (J - J_0)/J_0 \}$ should also be determined. The generalization of the instability criterion leads to the conclusion that the prestrain of the superconducting material can enhance or deteriorate the stability of the winding. (22 refs.)

77115 Superconducting properties and flux pinning in liquid quenched Nb-Ga alloys. G.B.Clemente, F.Habbal, J.Bevik (Gordon McKay Lab., Harvard Univ., Cambridge, MA, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.381-6

$\text{Nb}_{75}\text{-Ga}_{25}$ tapes were prepared by liquid quenching technique in an argon atmosphere. The transition temperature T_c , upper critical field H_{c2} and critical current density J_c were measured in both as-quenched and annealed samples. The values of T_c ranged from 16.5 to 18.0K in the as-quenched samples and increased upon annealing up to 20.0K. Similar increase was also observed in the values of H_{c2} from ~ 190 kOe to values higher than the attainable

field of 220 kOe. For annealed samples near stoichiometric composition, H_{c2} was estimated to be higher than 300 kOe. The critical current densities of these tapes are relatively low compared to other melt-quenched A-15 compounds. Flux pinning force, F_p , does not obey a single scaling law. The existence of two peaks in F_p at low temperatures and of only one peak at 13.4K for $1 \leq x \leq 4$ is discussed in terms of the microstructural characteristics of the samples. (5 refs.)

74.60E Mixed state, H_{c2} , surface sheath

77116 Mixed states in ferromagnetic superconductors. T.Koyama, S.Mae-kawa, M.Tachiki (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1750-8 (May 1983).

The magnetization process in the mixed state of ferromagnetic superconductors is theoretically studied. By taking into account the electromagnetic and the s-f exchange interactions between conduction electrons and localized magnetic moments, the Ginzburg-Landau free energy is obtained. The polarization of localized magnetic moments depresses the stability of mixed state and causes a convex curvature in the magnetization versus magnetic field curve near the upper critical field H_{c2} above the ferromagnetic transition temperature. This curvature becomes larger with decreasing temperature, and the magnetization jump occurs at low temperatures. The characteristic features of the magnetization process are in good agreement with those experimentally obtained by Crabtree et al. in single crystals of ErRh_4B_4 .

77117 Theory of the upper critical field in layered superconductors with magnetic intercalates. R.A.Klemm (Exxon Res. & Engng. Co., Linden, NJ, USA).

Solid State Commun. (USA), vol.46, no.9, p.705-8 (June 1983).

The author proposes a model for the layered superconductors with electronically isolated magnetic intercalates in which the electrons propagate freely in the dirty superconducting layers with arbitrarily strong spin-orbit scattering, and spin-flip scatter of the magnetic ions during interlayer tunneling. He calculates the upper critical field H_{c2} including demagnetization effects. In a parallel field below the dimensional-crossover temperature T^* , a new type of spin ordering is predicted. (5 refs.)

74.60G Flux pinning; fluxon-defect interactions

77118 Low-temperature—irradiation study of flux-line pinning in type-II superconductors. H.R.Kerchner, D.K.Christen, C.E.Klabunde, S.T.Sekula, R.R.Coltman, Jr. (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5467-78 (1 May 1983).

Annealed wires of Nb and Nb-20 at.% Ta were irradiated at liquid-helium temperature in two different modes. In one mode thermal neutrons produced 75% of the damage, while in the other mode fast neutrons produced 85% of the damage. The increase in critical current with fluence was measured in order to determine its dependence on pin type and density and material purity. Damage due to the fast-neutron component of the flux dominated the flux pinning in both modes. The observations were consistent with the collective statistical summation theory and inconsistent with the conventional single-particle theory. The elementary pinning interaction deduced from the data by using the collective statistical theory agreed well with a recent theoretical calculation of the interaction due to the electron scattering mechanism. (18 refs.)

77119 Effect of stainless steel reinforcement on the critical current versus strain characteristic of multifilamentary Nb_3Sn superconductors. J.W.Ekin (Electromagnetic Technol. Div., NBS, Boulder, CO, USA), R.Flukiger, W.Specking.

J. Appl. Phys. (USA), vol.54, no.5, p.2869-71 (May 1983).

A series of multifilamentary Nb_3Sn superconductors were fabricated containing from 0% to 52 vol.% stainless steel reinforcement strands as an integral part of the conductor. Critical current versus strain measurements are reported which show that the stainless steel introduces a relatively large compressive prestrain, ϵ_m , into the superconductor, ranging from $\epsilon_m \approx 0.3\%$ for no stainless steel reinforcement to $\epsilon_m = 0.84\%$ for 52 vol.% stainless steel. Accompanying this high compressive prestrain in the reinforced conductors is a large degradation of the conductor's critical current, I_c . The I_c degradation relative to the strain-free value has been measured, for example, to be more than 50% at 13 T for $\epsilon_m = 0.64\%$. Several methods are discussed for reducing the large I_c degradation in A15 superconductors containing internal reinforcement. (11 refs.)

77120 Symmetry analysis of magnetic structures and spin-waves on the basis of a stabilizer concept. Yu.A.Izyumov, O.V.Gurin (Inst. of Metal. Phys., Ural Sci. Center, Sverdlovsk, USSR).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.226-36 (April 1983). The common scheme for the group theory analysis of a crystal magnetic structure and a spin wave spectrum is developed. This scheme is based on the representation theory of a crystal space group G (for magnetic structure analysis) and on the co-representation theory of the Shubnikov group M of a magnetically ordered crystal (for spin wave analysis). Unlike the standard calculation, the procedure proposed is based on the conception of the stabilizer, the symmetry group of single atoms, and this considerably simplified the calculation work, reducing it to the work with the elements of the stabilizer and with the representatives of the expansion of the G or M groups with respect to the group of the stabilizer. It is enough to calculate the components of the basic functions only at one atom, as for the other atoms they may be found by the action of the representatives. For the symmetrization of the spin wave Hamiltonian matrix, a new mathematical procedure is used: the expansion of group G over the double coset classes. It lets one easily find the symmetric relations between the different matrix elements. The method is illustrated in the example of the complicated magnetic structure of a garnet, $\text{Dy}_3\text{Al}_2\text{O}_{12}$. The advantages of the new method are especially obvious in the case of structures with a great number of magnetic atoms in a primitive cell. (18 refs.)

75.10H Ising and other classical spin models**77121** Monte Carlo simulation of the antiferromagnetic Ising model on the triangular lattice with the first and second neighbour interactions. S.Fujiki, K.Shutoh (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan), Y.Abe, S.Katsura.

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1531-40 (May 1983). Monte Carlo simulations of the Ising model on the triangular lattice with the antiferromagnetic J and the ferromagnetic nnn interaction J' are carried out. Several physical quantities (magnetizations, energies, susceptibilities, specific heats of sublattices and of the total system) are calculated. A phase which resembles the partially disordered phase proposed by Mekata is observed in the finite temperature region. But it is shown in this region that the sublattice magnetizations vanish at the thermodynamic limit and the Kosterlitz-Thouless phase transition is predicted by the finite size analysis.

77122 Monte Carlo study of a triangular Ising lattice. I. K.Wada (Dept. of Phys., Hokkaido Univ., Sapporo, Japan), T.Ishikawa.

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1774-80 (May 1983). Monte Carlo calculations have been used to study the spin ordering on a triangular Ising lattice with antiferromagnetic nearest neighbor and ferromagnetic next nearest neighbor couplings. It is suggested that a partially disordered antiferromagnetic phase does not occur stably because the sublattices interchange their roles among them due to lattice symmetry.

77123 Free energy of the random Ising model in terms of the magnetizations of sites. T.Morita (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan). *Physica A (Netherlands)*, vol.119A, no.1-2, p.143-52 (April 1983). The free energy in the pair approximation of the cluster variation method is given in terms of the magnetizations of sites for the random Ising model. For a number of samples of the random-bond Ising model with nearest-neighbour interactions of $+J$ and $-J$, on the square lattice, search is made of the configuration which gives the lowest free energy. It is concluded that the spin-glass state is the state which gives the lowest free energy in the pair approximation for certain values of temperature and probabilities of J and $-J$. (20 refs.)**77124** The linear Ising magnet in a strong time-dependent field. III. Transverse fields rotating at the frequencies $\omega_{\pm 1} = \omega_0 \pm \omega_r$. G.O.Berim, A.R.Kessel (Kazan Phys.-Tech. Inst., Acad. of Sci., Kazan, USSR).

Physica A (Netherlands), vol.119A, no.1-2, p.153-8 (April 1983). For p.t.II see *ibid.*, vol.117A, p.603 (1983). The dynamics of the linear Ising model in the presence of transverse magnetic fields rotating at resonance frequencies not coinciding with the Zeeman frequency is studied. In the resonance approximation the expressions for some time-dependent spin averages are obtained. The property of total destruction of short-range order in the Ising spin-system by a time-dependent field is established. (9 refs.)

77125 Low-temperature renormalization-group study of the random-field model. Mau-chung Chang, E.Abrahams (Serin Phys. Lab., Rutgers Univ., Piscataway, NJ, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5570-5 (1 May 1983). The continuous-spin random-field model is investigated by means of the low-temperature renormalization-group technique with the use of the replica trick. The Wilson-Kogut recursion method is applied. For short-range exchange, the results are in exact agreement with those of the random-axis model studied by Pelcovits. For long-range exchange varying with distance R as $R^{-(d+\alpha)}$, critical exponents are calculated to first order in $d-2\alpha$. They are identical to those in a $d-\sigma$ expansion of the nonrandom model. However, the hyperscaling law becomes $(d+\lambda_T)\nu=2-\alpha$ (λ_T is the eigenvalue associated with the dangerous irrelevant operator T), and, for m -component spins, $-\lambda_T=\sigma+(d-2\alpha)/m$. (18 refs.)

77126 Self-similarity and fractal dimension of the devil's staircase in the one-dimensional Ising model. R.Bruinsma (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), P.Bak.

Phys. Rev. B (USA), vol.27, no.9, p.5824-5 (1 May 1983). The one-dimensional Ising model with long-range antiferromagnetic interaction in an applied field is known to exhibit a complete devil's staircase in its $T=0$ phase diagram. In this Comment the authors discuss its self-similar properties and determine the fractal dimension. (4 refs.)

77128 Magnetic susceptibility of the extended Hubbard model in one-dimensional complexes. S.T.Chui (Bartol Res. Foundation of the Franklin Inst., Univ. of Delaware, Newark, DL, USA). *Solid State Commun. (USA)*, vol.46, no.8, p.657-9 (May 1983). The magnetic susceptibility of a 1-D electron gas with on site and nearest neighbor Coulomb repulsions (U, V) is discussed in terms of antiferromagnetic chain with effective exchange J . For band fillings $\rho \leq 1/4$ $J \sim 4t^4/U^2$; for band fillings $\rho \geq 1/4$ $J \sim 2t^2/U$. This is substantiated by numerical calculations for finite chains with parameters estimated by Hubbard for TCNQ. The author finds that the effective J increases by a factor of ten at $\rho \sim 1/4$ for the TCNQ complexes. (14 refs.)

77129 Determination of the diamagnetic susceptibility and the electron static polarizability of crystals from X-ray diffraction data. G.A.Ivanov-Smolenskiy, V.G.Tsirel'son, R.P.Ozerov (Mendeleev Inst. of Chem. Technol., Moscow, USSR). *Acta Crystallogr. Sect. A (Denmark)*, vol.A39, pt.3, p.411-15 (1 May 1983).

The relationships associating the structure amplitudes, measured in a diffraction experiment, with the diamagnetic susceptibility and the static electron polarizability of ions for crystals with the NaCl-type structure are obtained. The calculations, carried out for a number of alkali halides and alkaline-earth oxides, have shown a good coincidence with the results of magnetic and optical measurements. The accuracy of the obtained results is analyzed; it is shown that when using accurate diffraction data the diamagnetic susceptibility and the electron polarizability may be determined with an accuracy of about 1%. (26 refs.)

77130 Characteristics of the magnetic susceptibility of films consisting of mixed-valence compounds. M.Sh.Erukhimov (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1984-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3485-7 (Nov. 1982). [received: May 1983]

The authors calculate the magnetic susceptibility of mixed-valence films employing the simplest model of noninteracting size-quantized systems of conduction electrons and d ions. (3 refs.)

77131 Spin susceptibility of electrons and magnetic hyperfine interactions in a conductor with resonance levels. V.O.Sokolov. *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.2002-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3511-12 (Nov. 1982). [received: May 1983]

Defects in some semiconductors form local levels which are in resonance with conduction electrons, i.e. which lie within the conduction band. The presence of such defects can alter significantly their structure, which in turn affects a number of properties of a crystal containing these defects, including the hyperfine interactions of nuclei. The author considers the spin susceptibility of electrons within the framework of a model employed earlier (1982) and also the influence of defects on the magnetic hyperfine interactions. (4 refs.)

77132 Magnetic and electrical properties of CrGe and Cr₁₁Ge₈. T.Sato, M.Sakata (Dept. of Instrumentation Engng., Keio Univ., Kanagawa, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1807-13 (May 1983).

The magnetic susceptibility χ and the electrical resistivity ρ of CrGe and Cr₁₁Ge₈ are investigated at temperatures above 4.2K. The magnetic susceptibility of CrGe exhibits a cusp at about 45K and shows the T^2 dependence with positive coefficient at low temperatures. This behavior of CrGe, together with the behavior of ρ , is explained by the paramagnon theory for a nearly ferromagnetic metal. The reciprocal of χ of Cr₁₁Ge₈ deviates from the Curie-Weiss type relation at low temperatures, and ρ of Cr₁₁Ge₈ shows tendency of saturation at high temperatures. These behaviors of Cr₁₁Ge₈ are explained by the SCR theory for a nearly ferromagnetic metal. The magnetic and electrical properties of CrGe and Cr₁₁Ge₈ indicate that the natures of electron correlations of these compounds locate in the intermediate region between the Pauli paramagnet Cr₅Ge₃ and the ferromagnet Cr₁₁Ge₉. (19 refs.)

77133 Theory of magnetic susceptibility of mixed-valent Ce_{0.76}La_{0.14}Th_{0.1}. J.C.Mohanty, P.K.Misra (Dept. of Phys., Berhampur Univ., Orissa, India). *J. Phys. C (GB)*, vol.16, no.14, p.2779-85 (20 May 1983).

The authors derive an expression for the magnetic susceptibility (χ) of a mixed-valent system in which there is a continuous valence transition to a nearly integral valent phase, taking into account the crystal electric field (CEF) splitting of the localised levels. As an example, they calculate χ of Ce_{0.76}La_{0.14}Th_{0.1} in which CEF excitations have been observed for the first time in a mixed-valent system. There is a good agreement with experimental results. (19 refs.)

77134 Iron above the Curie temperature. D.M.Edwards (Dept. of Math., Imperial Coll., London, England).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.213-16 (April 1983). A quantitative discussion is given of recent paramagnetic diffuse neutron scattering data on BCC Fe above T_c . It is found that although the spatial spin correlation function has a weak tail of fairly long range the correlation between nearest neighbour spin directions is very small at 1.24 T_c . It is concluded that the data are inconsistent with the giant short-range order hypothesis of Prange and Korenman (1979), Capellmann (1979) and Sokolov (1975) and another interpretation is given. (14 refs.)

77135 Magnetic susceptibility and electrical resistivity of electrotransport purified scandium single crystals from ≈ 1 to 300K. R.J.Stierman, K.A.Gschneidner, T.-W.E.Tsang, F.A.Schmidt, P.Klavins, R.N.Shelton, J.Queen, S.Legvold (Ames Lab., Iowa State Univ., Ames, IA, USA).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.249-54 (April 1983). The magnetic susceptibility of electrotransport purified Sc single crystals was measured from 0.7 to 295K. Both the easy (χ_a) and hard (χ_c) directions were measured using a microcomputer controlled Faraday apparatus. Above 50K the present results agree with earlier work on a less pure sample, but below 50K the present results are lower by as much as 4%. In addition the maximum at ≈ 30 K and the minimum at ≈ 6 K are much more pronounced in the purer material, and the susceptibility increases rapidly as the temperature approaches 0K. Electrical resistivity measurements were made on the same single crystals from 1.6 to 300K. The resistance ratios were 365 for the a -axis crystal and 274 for the c -axis crystal. At 300K, $\rho_a = 2.5 \rho_c$. (17 refs.)

77136 Kondo effect in disordered two-dimensional systems. F.J.Ohkawa, H.Fukuyama, K.Yosida (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1701-9 (May 1983). Interplay between localization and the Kondo effect has been examined for a model two-dimensional system. Various physical quantities associated with localized spins are calculated perturbatively in terms of the exchange coupling constant J and $\lambda = \hbar/2\pi\epsilon_F\tau_0$ where ϵ_F is the Fermi energy and τ_0 is the relaxation time of plane wave states; the susceptibility and the conductivity are shown to have quantum corrections proportional to $\lambda^2 \ln^2(t)$ and $\lambda^2 J^2/t$, respectively, where $t = \hbar/2\pi\tau_0 kT$. It is discussed that the ground states of localized spins are qualitatively the same as in pure systems because the ensemble average of local densities of states defined by $\langle \rho(\epsilon_1, r) \rho(\epsilon_2, r) \dots \rho(\epsilon_n, r) \rangle$ appears to be non zero for any n in the limit of equal energies, $\epsilon_1 = \epsilon_2 = \dots$.

77137 Magnetic-nonmagnetic transition in Ti-Mn alloys. A.S.Shcherbakov, N.V.Volkenshtein, E.G.Valiulin, N.Y.Permiyakov (Inst. of the Phys. of Metals, Acad. of Sci., Ural Sci. Center, USSR).

JETP Lett. (USA), vol.36, no.9, p.390-3 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.320-2 (5 Nov. 1982). [received: June 1983]

As the concentration of the magnetic component (Mn) in titanium is increased, the average magnetic moment of the impurity ions decreases, vanishing at ~ 10 at.% Mn. The concentration dependence of the magnetic moment is found. (5 refs.)

77138 Bethe-Ansatz solution of the Anderson model of a magnetic impurity with orbital degeneracy. P.Schlottmann (Inst. fur Festkörperforschung, KFA Julich, Julich, Germany).

Phys. Rev. Lett. (USA), vol.50, no.21, p.1697-700 (23 May 1983). A model for Ce impurities is considered, consisting of the $4f^0$ singlet and a multiplet of total angular momentum j of the $4f^1$ configuration hybridized with conduction states of the metal ($U \rightarrow \infty$ limit of Anderson's model). The model is solved by a Bethe Ansatz and exact expressions for ground-state properties, e.g. valence, spin and charge susceptibilities, and resistivity, are given. (23 refs.)

75.25 SPIN ARRANGEMENTS IN MAGNETICALLY ORDERED MATERIALS (NEUTRON STUDIES, ETC)

77139 Study of frustration effects in two-dimensional triangular lattice antiferromagnets—neutron powder diffraction study of VX₂, X=Cl, Br and I. K.Hirakawa, H.Kadowaki, K.Ubukoshi (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1814-24 (May 1983). In order to study the frustration effects, the authors have taken powder diffraction patterns of VX₂ (X=Cl, Br and I) which are thought to be

quasi-two-dimensional triangular lattice antiferromagnets. The spins in VCl_2 , VBr_2 and VI_2 were found to order at 36.0, 29.5 and 16.3 K respectively forming a three sublattice structure in the basal plane. Contrary to expectation, a partially ordered model gives a better fit to the observed diffraction rather than the Neel state with 120° structure though the spins are of Heisenberg symmetry. In VCl_2 and VBr_2 , strong diffuse scattering can be observed not only at $T > T_N$ but also at $T < T_N$. No critical scattering characteristic for 2D could be seen but the temperature variation of sublattice magnetization is rather close to that for the Ising system.

77140 Magnetisation density distribution in $\text{Mn}_{1/4}\text{TaS}_2$: observation of conduction electron spin polarisation. S.S.P.Parkin, E.A.Marseglia (Cavendish Lab., Cambridge Univ., Cambridge, England), P.J.Brown. *J. Phys. C (GB)*, vol.16, no.14, p.2749-64 (20 May 1983).

The authors have determined the magnetisation density distribution in the ferromagnetic layered compound $\text{Mn}_{1/4}\text{TaS}_2$, using the classical polarised neutron technique. These studies show that although the magnetisation is principally localised on the manganese sites, there is a significant spin polarisation of the conduction electrons, extending throughout the unit cell. These measurements thus provide direct evidence of an important interaction between the Ta conduction electrons and the localised moments on the Mn ions, confirming previous speculations based on transport and optical data. Moreover such an interaction suggests an obvious mechanism, the RKKY interaction, for the exchange interaction between the Mn moments. The moment on the Mn sites is depressed, as a result of this interaction, by about 15% compared with that expected for a Mn^{2+} d^5 ion. The Mn ions are surrounded by an antiferromagnetically polarised cloud of electrons and the maximum spin density within the TaS_2 layer is about 3% of the maximum spin density on the Mn site. There is no evidence from these experiments that the S atoms play a role in the magnetic Mn-Mn exchange interactions. (39 refs.)

77141 Magnetic structure of $\text{Co}_{1/3}\text{NbS}_2$ and $\text{Co}_{1/3}\text{TaS}_2$. S.S.P.Parkin, E.A.Marseglia (Cavendish Lab., Cambridge, Univ., Cambridge, England), P.J.Brown.

J. Phys. C (GB), vol.16, no.14, p.2765-78 (20 May 1983). The authors have examined the magnetic structures of the antiferromagnetic layered compounds $\text{Co}_{1/3}\text{NbS}_2$ and $\text{Co}_{1/3}\text{TaS}_2$ using single-crystal neutron photographic and counting methods. The magnetic structure of $\text{Co}_{1/3}\text{NbS}_2$ has been determined in detail, and has an orthorhombic unit cell, containing two Co atoms, arranged on the 'hexagonal ordering of the first kind' scheme. The different symmetries of the crystallographic and magnetic unit cells leads to a complicated domain structure. A large part of the magnetisation in this material is localised on the Co atoms, although the magnetic moment of the Co^{2+} ion is $\sim 10\%$ lower than that of the corresponding spin-only moment. The magnetic structure of the related material, $\text{Co}_{1/3}\text{TaS}_2$, which has the same crystal structure as $\text{Co}_{1/3}\text{NbS}_2$, is very different, and is a triangular antiferromagnetic structure although for this material only the unit cell has been determined. (27 refs.)

77142 Rare earth single-ion anisotropy and the magnetic structures of the RTiO_3 perovskites: $\text{R}=\text{Tb}$, Dy , Ho , Er and Tm . C.W.Turner, J.E.Greedan (Inst. for Materials Res., McMaster Univ., Hamilton, Ontario, Canada). *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.3, p.242-8 (April 1983). Attention is drawn to common features in the magnetic structures of the isostructural RMO_3 phases where $\text{R}=\text{Tb}$, Dy , Ho , Er and Tm and $\text{M}=\text{Al}$, Ti , Cr , Fe and Co . The orientation of the rare earth magnetic moment with respect to the orthorhombic c -axis depends only on R. For $\text{R}=\text{Er}$ and Tm the moments are parallel to the c -axis while for $\text{R}=\text{Tb}$, Dy and Ho they lie in the a - b plane. The in-plane moments are canted with respect to the a and b axes with both ferromagnetic and antiferromagnetic components and the canting angles are constant for a given R independent of M. Using symmetry arguments the authors show that the above systematics can be understood in terms of the rare earth single-ion anisotropy. Detailed calculations incorporating a crystal field of C_2 symmetry determined for Er^{3+} in YAlO_3 and an isotropic molecular field of magnitude appropriate to the RTiO_3 compounds produce results in agreement with the experimental observations. Essentially the same results are obtained for the crystal field of D_{4h} symmetry. The $B_0^0 O_0^0$ term in the crystal field Hamiltonian is identified as the factor which determines the orientation of the rare earth moment. (29 refs.)

77143 Canted ferromagnetism in PdMn and PdMnFe alloys. A.Kettshau, J.Boysen, W.D.Brewer (Inst. für Atom und Festkörperphys., Freie Univ. Berlin, Berlin, Germany), I.A.Campbell. *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.L1-6 (May 1983). From nuclear orientation measurements on Pd 3% Mn and Pd 5% Mn 0.35% Fe the authors find that at low temperatures the alloys behave as canted ferromagnets. They can estimate the probability distribution for the individual spin orientations and can observe the reduction in canting in strong applied fields. In the PdMnFe sample the Fe spins are much more highly aligned than the Mn spins. (13 refs.)

77144 Helimagnetism in alloys on the MnAs base. I.F.Gribanov, E.A.Zavadskii (Donetsk Phys.-Tech. Inst., Acad. of Sci., Donetsk, USSR). *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.51-7 (May 1983). Magnetic interactions in pseudobinary alloys on the MnAs base are analyzed using the group theoretical Bertaut method (1968). It is shown that side by side with isotropic exchange the exchange through conduction electrons plays an important part in formation of helimagnetic structure observed. Magnetic behaviour of crystals studied under pressure is discussed. Origin of canted ordering under lattice compression is grounded. (24 refs.)

77145 Antiferromagnetism of the FeNb and FeTa mu-phases. M.S.Ahmed, G.C.Hallam, D.A.Read (Dept. of Phys., Univ. of Leeds, Leeds, England). *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.101-9 (May 1983). The magnetic structure of the antiferromagnetic FeNb and FeTa alloys has been investigated using a variety of techniques including susceptibility, Mossbauer and neutron diffraction measurements. The results indicate a simple structure in which alternate Kagome layers of Fe atoms have their moments oriented in opposite directions, approximately perpendicular to the plane of the layers. Positive Weiss temperatures confirm that the dominant nearest neighbour intra-layer interactions are ferromagnetic. Specific heat and low angle neutron scattering observations suggest extensive short-range order above T_N . The substantial non-magnetic contribution to the Mossbauer spectra is shown to result from $\approx 25\%$ occupation of the high-coordination 'A' sites by Fe atoms with a similar proportion of the low-coordination B2 Kagome sites occupied by Nb. A structural neutron super lattice line too weak to have been observed in earlier work using X-rays suggests that the true μ -phase unit cell may be three times larger in dimensions than previously envisaged. (6 refs.)

77146 A binary ferromagnetic alloy with magnetic moments dependent on local environment. II. Neutron magnetic elastic scattering and hyperfine field distribution. A.V.Zaborov (Dept. of Phys., Ural Polytech. Inst., Sverdlovsk, USSR), M.V.Medvedev.

Phys. Status Solidi b (Germany), vol.116, no.2, p.511-23 (1 April 1983). For Pt I see *ibid.*, vol.116, p.227 (1983). The neutron magnetic elastic scattering and the hyperfine field distribution are calculated for a collinear ferromagnetic alloy with magnetic moments which depend on their local chemical environment in a step-like manner (Jaccarino-Walker model, 1965). The question is analyzed how, using experimental data, one can discern the model under study from a binary magnetic alloy with competitive nearest-neighbour exchange interactions and permanent magnetic moments. In the framework of the Jaccarino-Walker model the concentration dependences of the spontaneous magnetization and Curie temperatures for Ni and Co alloys with elements of the Pt as well as Pd group are considered. (20 refs.)

77147 Neutron diffraction effects of the distorted structure of Ni-67.7 at.% Fe alloy in the magnetic ordered state. S.F.Dubinin, S.G.Teplovchov, S.K.Sidorov (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).

Physica B & C (Netherlands), vol.119 B+C, no.1-2, p.57-60 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982). In a wide temperature range the neutron diffraction patterns of the single crystal Ni-67.7 at.% Fe have been analysed in which long-range ferro- and antiferromagnetic orders are formed in the state with the distorted lattice. Curie and Neel temperatures in this alloy have been estimated to be at the same time the points of the structural transformations indicating additional distortion of the crystal during the transition to the magnetic ordered state. The Invar effect of the Fe-Ni alloy is determined by the magnitude of these distortions. (8 refs.)

77148 Fermi-liquid approach to a description of localized magnetic moments in transition metals. V.N.Gitsovich, A.S.Kondrat'ev, V.M.Uzdin (A.A. Zhdanov State Univ., Leningrad, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.649-54 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

The method of quantum Green functions is used to derive equations in the periodic Anderson model allowing for the correlation interaction between electrons. These relationships correspond to the Fermi-liquid approximation for the description of the electron-electron interaction. A numerical calculation is made of the magnetic moments of α - and γ -modifications of iron corresponding to the ferromagnetic and antiferromagnetic ordering of a crystal. (15 refs.) A.T.

77149 Susceptibility of an isotropic ferromagnet. V.N.Fedosov (Polytech. Inst., Voronezh, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.660-4 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

A study is made of the distribution of the magnetization in an isotropic ferromagnet in the shape of a rod. The boundaries of opposite domains formed as a result of magnetization switching are shown to have a complex structure which is manifested in the dependence of the magnetic susceptibility on the rod dimensions. (9 refs.) A.T.

77150 Magnetic susceptibility of ordering $\text{Fe}_{1-x}\text{Mn}_x\text{Pd}_3$ alloys. B.V.Cherkashin, Yu.A.Vereshchagin, F.A.Sidorenko, A.A.Kuranov (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.820-2 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*.

The temperature dependence of the magnetic susceptibility was determined in the range 4.2-1250 K in various magnetic fields. The results were used to identify ferromagnetic and antiferromagnetic interactions in the atomically ordered and disordered states in these alloys. (9 refs.) A.T.

77151 Magnetic properties of amorphous Co and Ni alloys. K.H.J.Buschow (Philips Res. Labs., Eindhoven, Netherlands).

J. Appl. Phys. (USA), vol.54, no.5, p.2578-81 (May 1983).

The magnetic properties of amorphous alloys of the type $\text{Mg}_{1-x}\text{Ni}_x$, $\text{Zr}_{1-x}\text{Ni}_x$, $\text{Hf}_{1-x}\text{Co}_x$, and $\text{Nb}_{1-x}\text{Co}_x$ were studied in the temperature range 4.2-300 K. The saturation moments in these alloys and other Co-base amorphous alloys were analyzed in terms of a model proposed earlier, where account is taken of the size difference of the constituent metal atoms and the presence of compositional short-range ordering. It is shown that an additional moment reduction can be expected in amorphous alloys in which the 3d metal is combined with Ti, Nb, Ta, W, or Mo. (15 refs.)

77152 Magnetic properties and crystal distortion of hexagonal Mn_2Ga . H.Niida, T.Hori (Lab. of Phys., Shibaura Inst. of Technol., Saitama, Japan), Y.Nakagawa.

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1512-14 (May 1983).

Magnetization measurements and X-ray diffraction experiments have been made on $\epsilon\text{-Mn}_2\text{Ga}$ (71.4 at.% Mn) having a triangular spin structure with a weak ferromagnetic component below 460 K. It has been found that the D_{019} -type hexagonal structure is slightly distorted to an orthorhombic structure below 170 K, and that the transition is accompanied by a steep increase of spontaneous magnetization. The crystal distortion may enhance the deviation from the ideal triangular spin configuration.

77153 Random-field effects and magnetic susceptibility in diluted three-dimensional antiferromagnets $\text{Mn}_x\text{Zn}_{1-x}\text{F}_2$. H.Ikeda, K.Kikuta (Dept. of Phys., Ochanomizu Univ., Tokyo, Japan).

J. Phys. C (GB), vol.16, no.14, p.L445-51 (20 May 1983).

Magnetic susceptibility measurements have been made of the effect of applying a field on the critical divergence of the parallel susceptibility of the dilute antiferromagnets $\text{Mn}_x\text{Zn}_{1-x}\text{F}_2$ ($x=0.45$ and 0.6). The diverging susceptibility at the Neel temperature under an extremely weak external field, which originates from the coupling between uniform and staggered fluctuations, is sup-

pressed with increasing magnetic field. This and the appearance of the remnant magnetisation below the Neel temperature suggest that the phase transition in these systems is destroyed by the induced random magnetic fields and the system splits into micro-domains. (12 refs.)

77154 Effects of transition metal substitutions on magnetic properties of Co-based amorphous alloys. K.Hayashi, K.Hotai, M.Hayakawa, Y.Ochiai, H.Matsuda, S.Uedaira, K.Aso (SONY Corp. Res. Center, Yokohama, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.237-41 (April 1983). The effects of dilute concentrations of 3d-, 4d-, and 5d-transition metal solutes on magnetic moment and Curie temperature of Co-based amorphous alloys have been investigated. The changes of magnetic properties with transition metal substitutions are similar to those observed for corresponding crystalline Ni-based dilute alloys except the thermo-magnetic properties. The effects of transition metal substitutions on magnetic moment in Co-based amorphous alloys are well described in terms of the relative position of the Fermi level and the virtual bound state introduced in the 3d-band of the matrix by the transition metal atoms. (20 refs.)

77155 Study of the critical behaviour of the magnetization and electrical resistivity in cubic La(Fe, Si)₁₃ compounds. T.T.M.Palstra, J.A.Mydosh, G.J.Nieuwenhuys (Kamerlingh Onnes Lab., Rijks-Univers., Leiden, Netherlands), A.M.van der Kraan, K.H.J.Buschow.

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.290-16 (April 1983). The magnetic properties of the cubic NaZn₁₃ type pseudobinary compounds La(T₁Si_{1-x})₁₃ were studied for T=Fe, Co and Ni in the temperature range 4.2-300K. ⁵⁷Fe Mossbauer spectroscopy was performed on LaFe₁₁Si₂ and ⁵⁷Fe-doped LaCo₁₁Si₂. The compounds with T=Fe or Co are ferromagnetic, while the compound LaNi₁₁Si₂ is a Pauli paramagnet. The critical behaviour around the Curie temperature *T_c* was studied in La(Fe_{11-x}Si_x)₁₃ by measuring the temperature dependences of the zero-field susceptibility and the electrical resistivity. The critical exponent γ in the expression $\chi \propto (T-T_c)^{-\gamma}$ was found to be close to 1.38 corresponding to an isotropic Heisenberg ferromagnet. The anomalous critical behaviour shown by electrical resistivity measurements can be explained in terms of lattice softening associated with the Invar effect. (16 refs.)

77156 Note on the magnetic and magneto-optical properties of Ni₂In type 3d transition metal compounds. K.H.J.Buschow, P.G.van Engen (Philips Res. Labs., Eindhoven, Netherlands).

Phys. Status Solidi a (Germany), vol.76, no.2, p.615-20 (16 April 1983). The ternary compounds PtMnGa, PtMnAl, FeMnIn, FeMnIn, FeInGe, FeCoGe, FeMnGe, CoNiSn, FeNiSn, FeCoSn, and MnCoSn are found to crystallize in the hexagonal Ni₂In structure. The lattice constants of these compounds are determined and their magnetic properties studied in the range 4.2 to 300K. It is found that most of these compounds are ferromagnetic. For several of the compounds the complex polar Kerr effect is studied at room temperature in the energy range 0.6 to 4.4 eV. (13 refs.)

77157 Magnetic susceptibility of the canted spin compounds (CH₂)_n(NH₄)₂FeCl₄, n=4, 5, and 7. M.A.Semary, M.F.Mostafa, M.M.Abdel-Kader (Dept. of Phys., Univ. of Cairo, Giza, Egypt). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.K131-6 (16 April 1983). The authors report results on (CH₂)_n(NH₄)₂FeCl₄ with n=4, 5, and 7. The susceptibility behaviour measured in different values of the magnetic field strength is described. The magnetic susceptibility was measured by the Gouy method, and the diamagnetic correction was carried out. (13 refs.)

77158 Magnetic susceptibility of Fe_{1-x}Co_xSi solid solutions. P.V.Gel'd, A.A.Povzner, L.F.Romasheva (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.8, p.639-40 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1379-81 (Aug. 1982). [received: May 1983]

Investigates the magnetization and magnetic susceptibility of Fe_{1-x}Co_xSi solid solutions with 0 ≤ x ≤ 0.70 at temperatures from 4.5 to 1000K. The samples were prepared by melting components of high purity. To check that the homogenized alloys were in a single phase, the authors performed metallographic and X-ray structural analyses. These studies have made it clear that the functions $\chi(T)$ for alloys with x < 0.50 display two temperature regions in which the susceptibility obeys a Curie-Weiss law, but with different Curie-Weiss constants and paramagnetic Curie temperatures in each region. In contrast, for x ≥ 0.50 the magnetic susceptibility satisfies a single Curie-Weiss law at all temperatures above *T_c*. (8 refs.)

77159 Influence of Mn ion substitution by Fe on the electrical and magnetic properties of an La_{0.6}Pb_{0.4}MnO₃ crystal. E.P.Svirina, L.P.Shykhina, M.M.Lukina (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1947-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3428-30 (Nov. 1982). [received: May 1983]

The authors obtained new experimental data on the electrical and magnetic properties of La_{0.6}Pb_{0.4}MnO₃ and La_{0.6}Pb_{0.4}Fe_{0.22}Mn_{0.78}O₃ single crystals at temperatures from 80 to 800K. The aim was to determine the influence of partial replacement of Mn with Fe on the electrical and magnetic properties of the manganite crystals. The magnetization was measured with a vibration magnetometer. The spontaneous magnetization σ_s and the Curie temperature *T_c* were found by the method of thermodynamic coefficients. The electrical resistivity ρ and the thermoelectric power were determined using a DC potentiometer. A metal-semiconductor transition occurred in the region of the Curie temperature *T_c* (335K). The results show that the manganites are characterised by an exchange energy which is comparable with the band gap. (11 refs.)

77160 Characteristics of the magnetic microstructure of oxyfluoride ferrites. Sh.Sh.Bashkurov, A.B.Liberman, A.N.Men', A.M.Khasanov (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1959-61 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3448-50 (Nov. 1982). [received: May 1983]

The authors carried out a Mossbauer investigation of oxyfluoride cobalt ferrites Co_{1-x}Fe_xLi_{0.4-x}F_{0.6} (0 ≤ x ≤ 0.7). Values of the lattice parameters, magnetic saturation moments, and Curie temperatures are listed. The Mossbauer measurements were carried out using a gamma resonance spectrometer with constant acceleration. The source of gamma rays was ⁵⁷Co in a palladium matrix. (8 refs.)

77161 Spin waves in ageing ferromagnetic alloys with isostructural precipitates of a new phase. M.V.Medvedev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.629-35 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A dilute ageing ferromagnetic alloy with a low concentration of isostructural precipitates of a new phase is considered. It is assumed that the precipitates are distributed at random in the original phase. The Born approximation is used to study the characteristics of the dispersion and damping of long-wavelength spin excitations when they are scattered by the nuclei of the new phase and this is done for the absence of a chemical order and for the case of chemical ordering in the precipitates. (13 refs.) A.T.

77162 Guided magnetostatic surface waves on a metallic strip line. M.Uehara, K.Yashiro, S.Ohkawa (Dept. of Electronic Engng., Chiba Univ., Chiba, Japan).

J. Appl. Phys. (USA), vol.54, no.5, p.2582-7 (May 1983).

This paper gives a theoretical analysis for the geometrical configuration of a metallic strip deposited on ferrite film, which is available for MSSW (magnetostatic surface wave) waveguide. Dispersion curves and magnetic potential distributions are presented when the metallic strip of 100 μm wide is placed on the ferrite film of 10 μm thick. Since MSSW propagates along either the top surface with the strip, or the bottom face with no strip depending on its propagating direction, a strip-guided mode is nonreciprocal in the energy trapping effects, the number of guided modes, and the frequency bands. (6 refs.)

77163 Magnetic excitations in FCC Fe-Ni alloys revealed from detailed magnetization measurements. I.Nakai (Dept. of Phys., Okayama Univ., Okayama, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1781-90 (May 1983).

Detailed magnetization measurements for single crystals of Ni-rich Fe-Ni alloys have been carried out between 4.2K and 300K in external magnetic fields up to 16.9 kOe to a relative accuracy of 5 × 10⁻⁵. It is found by iterative least-squares analysis of these observed values that the temperature variation of magnetization consists of two parts: one is due to the spin-wave excitations and the other due to the Stoner-type excitations. The coefficient of the latter part has a considerable value at pure Ni, decreases with addition of Fe atoms to pure Ni, vanishing around 70 at.%Ni, and reappears at about 65 at.%Ni. A simple picture for metallic ferromagnetism at finite temperatures is proposed.

77164 Neutron scattering study of magnetic excitations in quasi-one-dimensional triangular lattice antiferromagnet CsVCl₃. H.Kadowaki, K.Hirakawa, K.Ubukoshi (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1799-806 (May 1983).

CsVCl₃ is composed of one-dimensional antiferromagnetic chains which are coupled weakly antiferromagnetically in the basal hexagonal plane. In order to clarify the anomalous properties hitherto observed, an inelastic neutron scattering has been studied. The authors observed good one-dimensionality of $J'/J = 2.7 \times 10^{-4}$. But, although $S = 3/2$, the spin wave dispersion along the chain disagrees with the classical picture. The excitation spectra along the triangular lattice plane are unusual. The excitation is dominated by a dispersionless mode of strong intensity. Compared to this mode, the conventional acoustic spin wave branch seems to be of minor excitation at lower temperatures than the Neel point.

77165 Influence of long-range order on magnon energy in itinerant electron ferromagnetic alloys. S.Lipinski, J.Morkowski (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).

Physica B & C (Netherlands), vol.119 B+C, no.1-2, p.37-40 (April 1983).

(Proceedings of the International Symposium on Magnetoelectricity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982). The stoichiometric binary alloys AB₃ of FCC structure are considered. The single-band tight binding Hamiltonian with intraatomic Coulomb interaction is used, the hopping integrals are restricted to nearest neighbouring atomic sites and are assumed independent of the species. The atomic potentials and the Coulomb integrals are assumed different for A and B atoms. The long-

range order parameter p characterizes the occupancies of the 4 s.c. sublattices, in which the FCC lattice is divided. A specific Ansatz is used to simplify the hopping part of the Hamiltonian, complicated in the Bloch basis. The spin wave stiffness constant D is calculated using the CPA method for calculating the average exchange contribution and the perturbation method to find the magnon scattering contribution. The dependence of D on the long-range order parameter p is calculated for Ni_3Fe and compared with the experimental data. (16 refs.)

77166 The problem of summation over physical states in a theory of interacting spin waves. V.G.Bar'yakhtar, V.N.Kirvoruchko, D.A.Yablonsky (Inst. for Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Solid State Commun. (USA)*, vol.46, no.8, p.613-18 (May 1983).

A new representation for the spin operators is suggested and on its basis the formalism involving both the rigorously of diagram technique for the spin operators and the simplicity of diagram technique for the Fermi- and Bose-system is developed to calculate the Green's spin functions. This method is a basis for constructing a theory of high-frequency and thermodynamic properties of magnetic ordered crystals and a systematic summation over physical states of interacting magnons at any temperatures. (12 refs.)

77167 Singularities in the spin wave spectra of ferromagnetic metals. A.G.Plyavenev (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2123-4 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3722-4 (Dec. 1983).

The singularities in the magnon dispersion law $\omega=\omega(q)$ of a ferromagnetic metal due to the interaction with conduction electrons characterized by an isotropic electron spectrum manifest themselves for the values $q=p\pm p_+$ of the magnon momentum (p_+ are the limiting electron momenta with opposite spin orientations). The author studies the singularities of $\omega(q)$ and the reciprocal lifetimes of magnons $\Gamma(q)$ for an arbitrary electron spectrum and for magnon momenta $q=p\pm p_+$. (5 refs.)

77168 Two-bridge mechanisms of indirect exchange. M.V.Eremin (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1825-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3216-22 (Nov. 1982). [received: May 1983]

Two-bridge mechanisms of indirect exchange between paramagnetic ions in insulators are studied. It is shown that they predominate in many cases over the simple additive sum of the contributions due to individual anion bridges and can lead to a strong ferromagnetic coupling. An effective exchange Hamiltonian, accurate up to the fifth order of perturbation theory in the electron hopping energy between an anion and a cation, is obtained and the principal parameters of the present theory are related to the spin densities at anion bridges. (5 refs.)

77169 Exchange interactions between dimers of chromium(III). A cluster approach. U.Hauser, H.U.Gudel (Inst. für Anorganische, Analytische und Phys. Chem., Univ. Bern, Bern, Switzerland).

Theor. Chim. Acta (Germany), vol.62, no.4, p.319-27 (1983).

Exchange interactions in dimers, tetramers and octamers of chromium(III) are treated with an effective Hamiltonian of the Heisenberg-Dirac-van Vleck type. Energies and wave functions of the cluster states are computed. The results of interdimer interactions are: (i) energy splittings and (ii) a contamination of the cluster ground state with excited configurations. The results are used for a qualitative rationalisation of the observed low-temperature properties of $\text{Cs}_3\text{Cr}_2\text{Cl}_9$. (9 refs.)

75.30G Anisotropy

77170 The magnetic anisotropy of an aligned MnAlC magnet. U.S.Ram, P.Gaunt (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2872-4 (May 1983).

The magnetic anisotropy constants K_1 and K_2 have been measured for an aligned MnAlC magnet. The information is extracted from magnetization curves with the magnetic field parallel and perpendicular to the alignment axis. The anisotropy field $H_A=2(K_1-2K_2)/I_s$ (I_s is the saturation magnetization) was determined from a break point in a plot of the perpendicular magnetization against the inverse square of the field. K_1 and K_2 were then found from modified Sucksmith-Thomson plots. The data is used to calculate the 180° wall energies and widths and an estimate of the temperature coefficient of coercive field variation is made and compared with experiment. (8 refs.)

77171 Magnetic anisotropy of ErCo_4Cu single crystals. Z.Drzazga (Inst. of Phys., Silesian Univ., Katowice, Poland).

Phys. Status Solidi a (Germany), vol.76, no.2, p.647-9 (16 April 1983).

Studies of magnetic moment and magnetocrystalline anisotropy of ErCo_4Cu single crystals are presented. ErCo_4Cu can be applied as a permanent magnet changing the sign of the coercive force with temperature. (9 refs.)

77172 Localization effect in CrRh alloys. D.Dadarlat (Inst. of Isotopic & Molecular Technol., Cluj-Napoca, Rumania), T.Petrisor, A.Giurgiu, I.Pop.

Phys. Status Solidi b (Germany), vol.117, no.1, p.155-9 (1 May 1983).

Magnetic susceptibility measurements of CrRh alloys are reported. Below the Neel temperature a temperature independent magnetic susceptibility is observed for the samples containing 10.9 and 14.5 at% Rh. A decrease of the magnetic susceptibility as a function of temperature is observed for samples containing between 5.14 and 14.5 at% Rh in the paramagnetic region. A slight localization, induced by Rh impurities on the host Cr atoms, is proposed in order to explain the peculiar behaviour. The magnetic phase diagram is also given. The Neel point rapidly increases at the beginning, with increasing Rh concentration, and then slowly decreases, giving rise to a large maximum at about 6 at% Rh. (7 refs.)

(inc. magnetic transitions, metamagnetism, etc)

77173 Cluster X_n approach to magnetic interactions and phase transitions in solids. V.A.Gubanov, A.I.Liechtenstein, A.V.Postnikov (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR).

Int. J. Quantum Chem. (USA), vol.23, no.4, p.1517-28 (April 1983).

A magnetic transition state model is developed for the description of magnetic interactions and magnetic phase transitions in solids. The model is based on the one-electron X_n molecular orbital calculations of clusters embedded in crystal lattice and allows quantitative investigations of magnetic interactions in d and f metals, their alloys, and compounds. The energies of local spin excitations and magnetic transition temperatures are calculated for a series of systems with the electronic states localized to a different extent. The effects of covalent bonding are introduced directly into magnetic parameters calculations and appear to be of crucial importance. Magnetic properties of some disordered alloys are considered basing on the results of X_n cluster calculations performed. In the low concentration limit, the local moment existence problem is being discussed. The dependence of magnetic properties upon concentration is considered. The results of calculations allow to give the reasonable interpretation of the experimental data available and show good possibilities of the cluster model in the description of magnetic effects in solids. (19 refs.)

77174 Magnetic properties of $(\text{Cr}_{1-x}\text{Rh}_x)_2\text{Te}_4$. S.Ohta, A.Fujii, S.Anzai (Keio Univ., Kanagawa, Japan).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1765-73 (May 1983).

Magnetization and susceptibility are investigated on a solid solution between Cr_2Te_4 [a ferromagnetic (F) and canted ferromagnetic (CF) compound] and Rh_2Te_4 [a Pauli paramagnetic one]. The ferromagnetic Curie temperature T_C decreases with increasing y , while the transition temperature T_1 between CF and F phases increases. In the higher y region, CF phase directly changes to the paramagnetic (P) phase at a transition temperature T_{CF} . The transition temperature T_{CF} decreases with increasing y , and disappears at $y=0.47\pm 0.02$ and $T=55\pm 15\text{K}$. An extra phase (Q) is found beyond CF one. Some characteristics of spin glass or micromagnetic states are observed in Q phase. Between $0.29\pm 0.03\leq y\leq 0.47\pm 0.02$, Q phase changes to CF one as the temperature increases. In the much higher y region, Q phase directly changes to P one. These features, together with the anomalous y -dependence of Weiss constant, are discussed on the competition between the negative and the positive exchange interactions. (16 refs.)

77175 Orbital exchange in the rare-earth dialuminides. B.Barbara, M.F.Rossignol (Lab. Louis Neel, CNRS, Univ. Sci. et Medecale Grenoble, Grenoble, France), E.Belozitzky, P.M.Levy.

Solid State Commun. (USA), vol.46, no.8, p.669-72 (May 1983).

An analysis of recent measurements of the paramagnetic Curie temperatures of the rare-earth dialuminides reveals the presence of an orbital contribution to the exchange interaction. (6 refs.)

77176 Existence of a canted phase in terbium yttrium iron garnets. K.F.Tsitskishvili, A.G.Mandzhavidze, N.G.Bazov, E.A.Biryukova, F.Kh.Akopov, V.M.Fedorov (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1964-5 (Nov. 1982).

Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3456-8 (Nov. 1982).

[received: May 1983]

Spin-reorientation transitions are a new form of magnetic phase transition. In the case of terbium yttrium iron garnets with the formula $\text{Tb}_2\text{Y}_{3-x}\text{Fe}_{10}\text{O}_{12}$ they have been investigated using a Mossbauer spectroscopy in the temperature range 80-300K using a constant-acceleration spectrometer with a $^{56}\text{Co}(\text{Cr})$ source and samples with terbium concentrations $x=0.26$ and 0.40 . In the case of the latter sample there was a spin-reorientation transition near 160K of the same type as the first transition observed at 135K. (12 refs.)

77177 Spin-reorientation phase transitions in hexagonal W ferrites in a magnetic field. Yu.A.Mamalui, V.N.Gorbach (A.M. Gorki State Univ., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1990-1 (Nov. 1982).

Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3494-6 (Nov. 1982).

[received: May 1983]

The authors construct spin-orientation phase diagrams for uniaxial ferromagnets along two directions of the magnetic field $H=H_x$ and $H=H_z$ and

include sixth-order terms in the expression for the magnetic anisotropy energy. The theoretical conclusions are checked experimentally using samples of the hexagonal ferrite, $\text{BaNi}_{0.5}\text{Co}_{0.5}\text{Fe}_{16}\text{O}_{27}$, which exhibits different types of magnetic anisotropy depending on the temperature. 75.40 CRITICAL-POINT EFFECTS, SPECIFIC HEATS, SHORT-RANGE ORDER

(inc. spin glasses)

77178 Spin glasses. J.Vey. *Ann. Inst. Henri Poincaré Sect. A (France)*, vol.38, no.3, p.255-62 (1983). A cohomological formulation of the frustration model is given for an arbitrary polyhedral complex. (2 refs.)

77179 Specific heats of $\text{Lu}_2\text{Mn}_{23}$, $\text{Gd}_2\text{Mn}_{23}$, $\text{Dy}_2\text{Mn}_{23}$, and $\text{Er}_2\text{Mn}_{23}$ from 1.7-18K. R.J.G.Tompson, H.W.White (Dept. of Phys., Univ. of Missouri, Columbia, MO, USA), K.Hardman, W.J.James. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2838-40 (May 1983).

Specific heat results are reported for the intermetallic rare earth compounds $\text{Lu}_2\text{Mn}_{23}$, $\text{Gd}_2\text{Mn}_{23}$, $\text{Dy}_2\text{Mn}_{23}$, and $\text{Er}_2\text{Mn}_{23}$ in the temperature range 1.7-18K. No evidence was found which indicated changes in magnetic spin structure for $\text{Gd}_2\text{Mn}_{23}$ and $\text{Dy}_2\text{Mn}_{23}$. The origin of a broad bump in the region from 2-8K for $\text{Er}_2\text{Mn}_{23}$ is not understood. The specific heat of the diamagnetic compound $\text{Lu}_2\text{Mn}_{23}$ was well described by the expression, $C = \gamma T + \alpha T^3 + \delta T^5$, where $\gamma = 0.277 \pm 0.005$ and $\delta = 0.00285 \pm 0.00005$ when C is in units of J/mol K. From the value of α , θ_D was calculated to be $270 \pm 2\text{K}$. (5 refs.)

77180 Critical magnetic behavior of uranium monosulphide. A.T.Aldred (Argonne Nat. Lab., Argonne, IL, USA), R.Troc. *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.3, p.217-25 (April 1983).

A detailed magnetization study has been made on ferromagnetic US near its Curie temperature. The critical exponent values γ , β and δ have been determined, and are close to those found earlier for UTe. The scaling law and then the homogeneous equation of state are exactly satisfied. The authors also present the tentative results of an analysis of the α exponent, deduced from the heat capacity data of Flotow et al. (1971). The findings are summarized and compared with those previously reported for US and UTe. (34 refs.)

77181 Landau theory of magnetic phase diagrams and first order magnetisation processes. W.I.Khan, D.Melville (Dept. of Phys., Univ. of Southampton, Southampton, England). *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.3, p.265-70 (April 1983).

The Landau free energy expansion up to sixth order in the magnetisation has been used to study ferro- and paramagnetic phases in zero and finite applied

magnetic fields. Magnetic phase diagrams are determined in terms of Landau coefficient ratios which indicate first order and metamagnetic phase transitions. In addition the critical magnetic field and specific magnetisations corresponding to first order magnetisation processes are calculated in terms of these coefficients. A method of evaluating Landau coefficients is also demonstrated. (15 refs.)

77182 Calculation of the Green's function for the micromagnetic thin film problem. W.Maass, U.Krey, H.Hofmann (Univ. Regensburg, Regensburg, Germany).

J. Magn. & Magn. Mater. (Netherlands), vol.37, no.1, p.11-29 (May 1983). The spatial dependence of the Green's function of the micromagnetic thin film problem is calculated. Introducing contours of equal function values (coupling areas) the authors discuss the behaviour of the Green's function, which depends crucially on a single constant q resulting from the magnetic and geometric film parameters. In the case of a typical polycrystalline or amorphous film with $q \ll 1$ (i.e. small anisotropy and large magnetization) the contours have a typical long extended shape over a wide range of r -values. This corresponds to Hoffmann's (1964) former linear ripple theory, which supplies a good description of the essential physical features just in this case. On the other hand, in the event of $q \approx 1$ or $q \gg 1$ (i.e. for very thin films with a small magnetization M_s and a large anisotropy) the shape of the coupling areas shows a much stronger dependence on the distance r . This should considerably influence the magnetic properties of such films, e.g., the magnetic ripple spectrum. (17 refs.)

77183 Metastability region in spin-glasses. Z.Gulacsi, M.Crisan, M.Gulacsi, A.Anghel (Dept. of Phys., Cluj Univ., Cluj, Rumania).

J. Magn. & Magn. Mater. (Netherlands), vol.37, no.1, p.58-62 (May 1983). The stability of the Sherrington-Kirkpatrick model (1978) is reconsidered, pointing out that the de Almeida-Thouless line (1978) from the phase diagram does not imply the replica symmetry breaking at the zero magnetic field. (4 refs.)

77184 Spin glasses. I. K.H.Fischer (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany).

Phys. Status Solidi b (Germany), vol.116, no.2, p.357-414 (1 April 1983). After mentioning in a general way the properties of spin glasses, the author goes on to discuss spin glass models. There are sections on the Edwards-Anderson model, the Sherrington-Kirkpatrick model, ground state properties of spin glasses, frustration and gauge theory, the dynamics of vector spin glasses, the special spin glass system $(\text{EuSr})\text{S}$, random site models and transport properties. The article concludes with a discussion of a few experiments believed to be especially important for the understanding of spin glasses. (214 refs.)

77185 On the Schrodinger spin-exchange ferromagnet. H.A.Brown (Dept. of Phys., Univ. Missouri, Rolla, MO, USA).

Phys. Status Solidi b (Germany), vol.117, no.1, p.177-84 (1 May 1983). The thermodynamic behavior of a ferromagnet whose interactions are described by the Schrodinger spin-exchange operator is investigated. The transition temperatures, magnetization, susceptibility, exchange energy, heat capacity, and entropy are calculated for general spin and lattice coordination number using the constant-coupling approximation. Both first- and second-order phase transitions are found. Comparison with some results of the high-temperature expansion method shows some qualitative agreement. (16 refs.)

77186 Computer simulation of the low-frequency spin dynamics in $\text{Eu}_x\text{Sr}_{1-x}\text{S}$. W.Y.Ching (Dept. of Phys., Univ. of Missouri, Kansas City, MO, USA), D.L.Huber.

Phys. Rev. B (USA), vol.27, no.9, p.5810-12 (1 May 1983). The authors report the results of a computer simulation of the low-frequency harmonic magnon modes in $\text{Eu}_x\text{Sr}_{1-x}\text{S}$ for $x=0.8$ and 0.4. No evidence of hydrodynamic spin-wave modes is found in the spin-glass phase ($x=0.4$) for wave vectors $q \approx \pi a/6$ (where a is the lattice constant), in contrast to the ferromagnetic phase ($x=0.8$) where ferromagnetic spin waves are presented. Comparisons are made with experimental results for the reentrant spin-glass $\text{Fe}_{0.26}\text{Cr}_{0.74}$. (10 refs.)

77187 $O(n)$ spin systems in two dimensions. R.Brout, W.Deans, A.Silov (Faculté des Sci., Univ. Libre de Bruxelles, Bruxelles, Belgium).

Phys. Rev. B (USA), vol.27, no.9, p.5813-14 (1 May 1983). The Monte Carlo data of the two-dimensional $O(3)$ spin system are shown to be interpretable in terms of the simple concepts of reaction field (spherical model), spin waves, and asymptotic freedom. The reaction field is the predominant feature at high temperatures and at low (bare) temperatures and long distances. Spin waves and asymptotic freedom dominate at low temperatures and short distances. (5 refs.)

77188 Low-temperature scaling for systems with random fields and anisotropies. A.Aharony, E.Pytte (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5872-4 (1 May 1983). Random fields (or anisotropies) shift the lower critical dimensionality of spin systems from d_c^0 to d_c . For dimensionalities $d_c^0 < d < d_c$ at low temperatures T , the magnetization has a discontinuity (from zero to m) when Δ (the average square field) approaches zero. The correlation length ξ diverges as $\Delta^{-\nu_2}$. The structure factor is shown to scale as $S(q, \xi) = \xi^{\nu_2} S(q\xi)$. Simple assumptions on scaling near $T=0$ yield $\nu_2 = 1/(d_c - d)$, with $d_c = 4$ for continuous symmetry spins and $d_c = 2$ for Ising spins. (25 refs.)

77189 Dimensional reduction with correlated random fields. A superspace renormalization-group calculation. M.Kardar, B.McClain, C.Taylor (Dept. of Phys., MIT, Cambridge, MA, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5875-8 (1 May 1983). Considers phase transitions in the presence of random magnetic fields, with long-range correlations such that $\langle h(0)h(r) \rangle \sim 1/r^{d-\sigma}$. The upper critical dimension is $6+\sigma$. A superspace renormalization-group calculation is carried out to order ϵ^2 , where $\epsilon = 6+\sigma-d$. To order ϵ , the critical properties are that of a pure system in $d-2-\sigma$ dimensions. This dimensional reduction is also justified by physical arguments concerning the lower critical dimensionality, and the hyperscaling relationship. However, it fails at order ϵ^2 . (17 refs.)

77190 Spin-reorientation phase transition in rare-earth hexagonal ferrites. Yu.A.Mamalui, L.P.Ol'khovik (A.M. Gorki State Univ., Kharkov, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1949-50 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3431-3 (Nov. 1982). [received: May 1983]

To explain the low-temperature magnetic behavior, the authors study the spin-reorientation phase transition in a hexagonal ferrite in magnetic fields of different orientations including the sixth-order terms in the anisotropy energy. They discuss in detail the case where the constant $K_2 < 0$, corresponding to the sign of K_2 observed for $\text{La}_{0.5}\text{Na}_{0.5}\text{Fe}_{12}\text{O}_{19}$. (4 refs.)

77191 Discontinuities of the order parameter in system of mutually interacting single-level particles. E.L.Nagaev, A.I.Podel'shchikov. *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1951-2 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3434-6 (Nov. 1982). [received: May 1983]

Shows that discontinuities in the order parameter which are not accompanied by any changes in the ordering can occur not only in the obvious case of multilevel particles but also in the case of single-level particles provided their mutual interaction is of special type. As an example, they quote a magnetic system with non-Heisenberg exchange interactions between localized moments of a given length. It has been shown that a first-order order-disorder transition can occur in such a system provided the biquadratic exchange is comparable with the four-spin or biquadratic exchange. However, the possibility of a first-order phase transition of the order type—the same order in non-Heisenberg magnetic materials—has not been discussed. The authors perform a simple molecular-field calculation for a model with the standard two-spin Heisenberg exchange and also with the four-spin and six-spin exchange interactions. (7 refs.)

77192 Renormalisation-group specific heat of the square-lattice Potts ferromagnet. H.O.Martin (Dept. de Física, Univ. Nacional de La Plata, La Plata, Argentina), C.Tsalis.

J. Phys. C (GB), vol.16, no.14, p.2787-95 (20 May 1983). The free and internal energies and specific heat of the q -state Potts ferromagnet are discussed. A real-space renormalisation-group approach is presented, which reproduces a considerable amount of exact particular results for all dimensionalities (hypercubic lattices). The case of the square lattice is investigated in detail using self-dual clusters (which provide the exact critical point for all q). Comparison with Onsager results ($q=2$) is satisfactory; the general tendencies for $q \neq 2$ ($1 \leq q \leq 4$) are exhibited, and the bound percolation limit ($q \rightarrow 1$) is worked out in some detail. (28 refs.)

77193 The existence of a phase transition in classical antiferromagnetic models. F.J.L.C. Calheiros (Centre de Phys. Theorique, CNRS, Marseille, France).

J. Stat. Phys. (USA), vol.31, no.1, p.141-54 (April 1983). For a wide class of antiferromagnetic models the author proves the existence of a phase transition using an extended Peierls argument, taking into account a result of Dobrushin (1968) for an antiferromagnetic Ising model and the results of Malyshev (1975) for ferromagnetic models (such as the anisotropic rotator). In particular the author reviews a result of Fröhlich, Israel, Lieb, and Simon (1980) obtained when reflection positivity holds. (7 refs.)

77194 Critical point estimates for the spin s Ising model from the high temperature series renormalisation group method. K.De Bell, D.D.Betts (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada).

Physica A (Netherlands), vol.119A, no.1-2, p.78-82 (April 1983). By prefacing the high temperature series renormalisation group transformation with a spin restructuring transformation, estimates of the critical point of the spin s Ising model on the square and triangular lattices have been obtained. The systematic nature of the high temperature series method is preserved and the accuracy of the estimates appears to be principally dependent on the accuracy with which the $s=1/2$ critical point is determined. (7 refs.)

77195 Critical temperature for a random-bond Ising model with frustration on a square lattice. T.Horiguchi (Dept. of Engng. Sci., Tohoku Univ., Sendai, Japan).

Physica A (Netherlands), vol.119A, no.1-2, p.83-91 (April 1983). For a random-bond Ising model with frustration on a square lattice in which all the vertical bonds in a column are the same random variable while the horizontal bonds are mutually independent random variables, the author calculates an interface free energy for the ferromagnetic phase by means of the method of Muller-Hartmann and Zittartz. The critical temperature is obtained numerically for the system in which the random bonds take on $J>0$ and $-J$ with respective probabilities p and $1-p$. The interface free energy at zero temperature is obtained in a closed form and the critical concentration is equal to $3/4$. (8 refs.)

77196 Random-field effect in diluted Ising antiferromagnets. M.Fahnle (Max-Planck-Institut für Metallforschung, Inst. für Phys., Stuttgart, Germany).

Phys. Rev. B (USA), vol.27, no.9, p.5821-3 (1 May 1983). It is argued that near the percolation threshold of diluted systems there should be an instability of the long-range order in spatially random fields much smaller than the local molecular fields as a result of the strong ramification of the infinite percolation cluster, in all dimensions. This may give a possible explanation for the experiments of Yoshizawa et al., who find a destruction of the long-range order due to relatively small external magnetic fields in diluted two- and three-dimensional Ising antiferromagnets. (16 refs.)

77197 Magnetic properties of a disordered magnet with strong fluctuations in the exchange interactions. G.A.Petrakovskii, E.V.Kuz'min, S.S.Aplesnin (Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1872-6 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3298-304 (Nov. 1982). [received: May 1983]

The Monte Carlo method is applied to an Ising magnet with a random distribution of exchange bonds of different sign and fluctuating strongly in

magnitude. The phase diagram of magnetic states is constructed using the concentration of antiferromagnetic bonds and temperature as the coordinates. The regions of existence of a disordered ferromagnetic state, a spin glass state, a superantiferromagnetic state, and a random antiferromagnetic state are found. Thermodynamic properties of an Ising magnet such as the energy, magnetization, specific heat, and correlation functions are evaluated. The distribution function of local fields is also obtained. (13 refs.)

77198 Ising model with magnetic field and the Diophantine moment problem. V.S.Vladimirov, I.V.Volovich (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.943-52 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.3-15 (Oct. 1982).

The properties of the Lee-Yang measure describing the distribution of the zeros of the partition function for the ferromagnetic Ising model with magnetic field that follow from the condition that its moments be Diophantine are studied. (15 refs.)

75.40F Heisenberg and other quantized spin models

77199 Effect of uniaxial long-range exchange interaction on the properties of surface spin waves in a Heisenberg ferromagnet. T.G.Petrova, E.S.Syrkin (Physico-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).

Phys. Status Solidi b (Germany), vol.116, no.2, p.475-81 (1 April 1983).

The low- and high-frequency surface states in a single-magnon spectrum of the Heisenberg ferromagnet with uniaxial exchange interaction of the long-range type are studied. The energies and damping decrements of surface spin waves and the surface projected spectral densities of magnon states are obtained. It is found that the considered anisotropic interaction results in new formation conditions of the surface spin waves and essentially affects their characteristics. (13 refs.)

77200 Low-temperature expansion of spin Green's functions and Dyson-Maleev formalism. V.G.Baryakhtar, V.N.Krivoruchko, D.A.Yablonskii (Donets Physicotech. Inst., Acad. of Sci., Ukrainian SSR).

Theor. & Math. Phys. (USA), vol.53, no.1, p.1047-50 (Oct. 1982). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.53, no.1, p.156-60 (Oct. 1982).

A one-to-one correspondence is established in general form between the calculation of the spin Green's functions in the Maleev representation and their calculation in the technique of spin operators. It is shown that the non-Hermiticity of the Maleev representation does not affect the results of the calculations, and the contribution of the unphysical states in the case of a Heisenberg ferromagnet for $T < S_0$ is especially small—of order $\exp(-T^2/T)$, where $T^2 = S(2S+1)J_0$ (S is the spin of the atom, and J_0 is the Fourier component of the exchange integral with zero wave vector). - 77201 Bloch wall arrangement and Barkhausen noise in steels 22 NiMoCr 3 7 and 15 MnMoNiV 5 3. P.Deimel, D.Kuppler, K.Herz (Univ. of Stuttgart, Stuttgart, Germany), W.A.Theiner. *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.3, p.277-89 (April 1983). The changes of Bloch wall arrangement and of the microstructure (dislocations, precipitates and residual stresses), caused by isothermal tempering were investigated using transmission electron microscopy. For corresponding material conditions the magnetic and acoustic Barkhausen noise was measured using the pick-up technique. It was observed that the Bloch wall arrangement of the 22 NiMoCr 3 7 steel compared with the 15 MnMoNiV 5 3 steel changes distinctly with increasing tempering time. This is also true for the magnetic Barkhausen noise. The different dependence on tempering time for both steels is correlated with the different decrease of the dislocation density with tempering time. Using the microstructural data and the observed Bloch wall arrangements as base, a concept of a model describing the process of remagnetization is discussed. (11 refs.)
- 77202 Domain wall dynamics of rare-earth orthoferrites. Yu.V.Melikhov, O.A.Perekhod. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.713-16 (May 1983). In Russian. An equation of motion is derived for a hard domain wall in a weak ferromagnet. It is shown that the gyrocoupling force in this type of a domain wall does not appear. Expressions are obtained for velocities of the steady-state motion of the hard domain wall and vertical Bloch line. (16 refs.)

- 77203 Pulse magnetisation of permanent magnets with a closed-loop assembly of electrical apparatus. V.I.Astapov, V.V.Vasil'ev, V.A.Nesterin. *Izv. VUZ Elektromekh. (USSR)*, no.3, p.87-90 (March 1983). In Russian. Discusses a technique for the magnetisation of permanent magnets, within a closed magnetic circuit of electrical apparatus. The construction of a single-turn magnetising inductor is described, a curve for the magnetic field in the working area is presented and recommendations are made for the choice of the geometrical parameters of the inductor. The procedure envisages the use of a pulse transformer unit, together with the single-turn inductor, for the magnetisation of permanent magnets. (2 refs.) Z.F.V.
- 77204 Hysteresis-free magnetisation in the presence of slowly varying and sinusoidal fields. V.P.Kholodkov. *Izv. VUZ Elektromekh. (USSR)*, no.3, p.91-6 (March 1983). In Russian. Investigates the process of a hysteresis-free magnetisation of ring ferromagnetic cores, in the presence of sinusoidal fields, and fields which vary slowly in an arbitrary manner. Expressions are derived, describing the relationship between the magnetisation of ring cores with a square hysteresis loop and parameters of these fields. (5 refs.) Z.F.V.

- 77205 Role of T^2 term in temperature dependence of the magnetization for Fe-Ni Invar alloys. I.Nakai, F.Ono, O.Yamada (Dept. of Phys., Okayama Univ., Okayama, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1791-8 (May 1983). Precise measurements of magnetizations for single crystals of FCC Fe-Ni alloys in the Invar region have been made at temperatures from 4.2K to 300K in external applied fields up to 16.9 kOe to a relative accuracy of 5×10^{-3} . In an analysis of these observed results with iterative least-squares method, it is found that there exists a large Stoner-type contribution varying as $T^{2.00 \pm 0.05}$ besides the spin-wave one to the temperature change in magnetization and that the coefficient of the Stoner-type contribution increases rapidly with decreasing Ni concentration, showing a maximum at about 35 at.%Ni, and decreases for the alloys containing less than 35 at.%Ni. It becomes evident that ferromagnetism in FCC Fe-Ni alloys disappears at a critical concentration of about 31 at.%Ni. An anomalous behavior of the magnetization at low temperatures is also shown.
- 77206 Magnetic properties of $\text{Sn}_{1-x}\text{Cr}_x\text{Te}$ crystals. M.Inoue, Y.Takai, K.Fukui, H.Yagi, T.Tatsukawa (Faculty of Engng., Fukui Univ., Fukui, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.3, p.255-8 (April 1983). Magnetization measurements of magnetic semiconductor $\text{Sn}_{1-x}\text{Cr}_x\text{Te}$ ($x < 5$ at.%) crystals with the Curie temperature $T_c = 150$ -300K were made down to 2K. The magnetic properties are sensitive to isothermal annealing under Zn vapor. The overall magnetizations of the Zn-annealed crystals have paramagnetic and ferro- or antiferromagnetic components. (4 refs.)
- 77207 The hysteresis loop of two-phase particulate magnetic composite with non-linear hard magnetic components. K.-L.Wang, S.-E.Hsu, J.Chen (Nat. Taiwan Univ., Taipei, Taiwan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.77-82 (May 1983). The method of calculating the B-H curve of two-phase ferromagnetic composite materials whose components have B-H relations of the form $B = mH + Br$ is extended to include materials whose components have non-linear B-H relations. The functional form of the non-linear B-H curve of the components materials is simulated by hyperbolic tangent functions with adjustable parameters. The results of theoretical calculations are compared to experimental data on Mn-Al-C and Fe-Cr-Co particulate composites. Good agreement is obtained. (9 refs.)
- 77208 Magnetization and Mossbauer studies of $\text{Y}(\text{Fe,Rh})_2$. J.Hrubec, W.Steiner, M.Reissner (Inst. für Angewandte und Tech. Phys., Tech. Univ. Wien, Wien, Austria). *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.93-100 (May 1983). Magnetization as well as ^{57}Fe Mossbauer measurements of the cubic Laves phases $\text{Y}(\text{Fe,Rh})_{1-x}$ ($x \leq 0.3$) are reported. Pauli paramagnetism is observed for YRh_2 . At high temperatures Curie-Weiss behaviour is obtained for $x \geq 0.1$. The effective moments increase with increasing x, indicating that a polarization of the surrounding Rh atoms is caused by the substituted Fe atoms. At low temperatures no long-range magnetic order is observed, however, Mossbauer spectra with magnetic hyperfine splitting are recorded. The field dependence of the magnetization indicates the existence of noninteracting magnetic clusters. Field cooling effects and time dependence of the remanence are also observed. Therefore micromagnetism is suggested for these compounds, although no clear indication for the appearance of a maximum in the temperature dependence of the susceptibility is observed. (27 refs.)
- 77209 Magnetization and ^{161}Dy Mossbauer effect study of DyMn_2 and Dy,Mn_{1-x} and their ternary hydrides. P.C.M.Gubbens, W.Ras, A.M.van der Kraan, K.H.J.Buschow (Interuniv. Reactor Inst., Delft, Netherlands). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.277-82 (1 May 1983). The compounds DyMn_2 and $\text{Dy}_x\text{Mn}_{2-x}$ and their ternary hydrides are investigated by means of magnetic measurements and ^{161}Dy Mossbauer spectroscopy. In DyMn_2 magnetic ordering disappears after charging with hydrogen gas. In $\text{Dy}_x\text{Mn}_{2-x}$ the absorption of hydrogen gas leads to a strong reduction of the bulk magnetization even though the Dy sublattice remains magnetically ordered at low temperatures, with magnetic moments on the Dy atoms close to the free ion values. (12 refs.)
- 77210 Influence of substitution and addition of calcium on magnetic properties of $\text{Ni}_{0.245}\text{Zn}_{0.755}\text{Fe}_2\text{O}_4$ ferrite. C.Pasnicu, D.Condurache, E.Luca (Phys. Dept., Polytech. Inst. of Iasi, Iasi, Rumania). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.145-50 (16 March 1983). The influence of both Zn and Ni substitution and Ca addition on the stoichiometry in $\text{Ni}_{0.245}\text{Zn}_{0.755}\text{Fe}_2\text{O}_4$ ferrite on the saturation magnetization, Curie point, and initial permeability is studied. The dependence of these properties on the Ca amount is discussed. The results are interpreted taking into account the solubility of Ca^{2+} ions in the spinel lattice. (14 refs.)
- 77211 Model for a porous magnetized material. A.V.Sandulyak. *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1391-2 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2267-9 (Nov. 1982). [received: May 1983]
- The theory of how porous materials (consisting of spherical particles) are magnetized is developed further and it is shown that efficient magnetic flux 'channels' are present in such materials. An equation is derived for calculating the magnetic permeability of a quasicontinuous channel and the effective channel radius. (4 refs.)
- 77212 Preparing conditions and magnetic properties of rapidly quenched high silicon iron ribbons. Y.Yoshida, Y.Yamashiro, N.Teshima, K.Narita. *Technol. Rep. Kyushu Univ. (Japan)*, vol.55, no.6, p.627-33 (Dec. 1982). In Japanese. [received: May 1983]
- Preparation conditions and magnetic properties of rapidly quenched high silicon iron ribbons containing 4.5%-6.5%Si have been investigated. The tensile strength and the ductility of high silicon iron ribbons were improved compared with sheet-formed high silicon iron. The specimens were annealed at 1100°C-1200°C for 1 hr in H_2 gas or in vacuum. The maximum permeability μ_m of 17000, and the minimum coercive force H_c of 0.3 Oe were obtained on the specimen of 6.5%Si-Fe with 90 μm thickness. For the 6.5%Si-Fe quenching effect on the coercive force had been investigated, but marked improvement was not observed in the authors' quenching temperature range (400-600°C). (7 refs.)

77213 Magnetically hard Alnico 5 alloy with a mischmetal addition. S.Szymura (Inst. of Phys., Tech. Univ. of Czestochowa, Czestochowa, Poland). *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.69-76 (May 1983). The addition of mischmetal (CeM) to the Alnico 5 alloy of equiaxial grain structure in the amounts of 0.0 to 0.31 wt.% and its effect on the magnetic properties, the crystal structure and on the type of non-metallic inclusions in the alloy has been studied. The addition of CeM in amounts within the examined limits, was found to cause a worsening of all magnetic properties of the Alnico 5 alloy, the greatest changes being observed in the maximum magnetic energy product $(\text{BH})_{\text{max}}$ and the smallest in the coercive force H_c . CeM also causes a considerable reduction in the size of grains. The main types of non-metallic inclusions in the Alnico 5 alloy with CeM addition are: oxide $(\text{CeMM})_2\text{O}_3$, oxysulphides $(\text{CeMM})_2\text{O}_3\text{S}$ and sulphides $(\text{CeMM})_2\text{S}_3$, type, on the edges of which occur titanium or manganese sulphides. For up to 0.16 wt.% of CeM the mean content of non-metallic inclusions in the alloy is decreasing, whereas it is markedly rising with the content of the CeM over 0.16 wt.%. Also the mean size of inclusions is clearly smaller in the alloy with less than 0.16 wt.% of CeM than with higher contents of CeM. A 0.16 wt.% addition of CeM significantly improves the susceptibility of Alnico 5 alloy to surface finishing treatment by grinding. (27 refs.)

77214 Fe-Cr-Co ductile permanent magnet alloy with $(\text{BH})_{\text{max}} \approx 7.0$ MGOe. Li Dongsheng, Peng Huizi, Sun Jinsheng, Zhang Yuquan, Ju Kechang (Tianjin Metall. Res. Inst., China). *Kexue Tongbao (Foreign Lang. Ed.) (China)*, vol.28, no.1, p.45-50 (Jan. 1983). [received: June 1983] The authors present a study of the Fe-Cr-Co alloy with high $(\text{BH})_{\text{max}}$ value. The effects of the addition of Zr, the covering of the Co content and the addition of Si on the magnetic properties B_r , H_c , and $(\text{BH})_{\text{max}}$ are presented. (4 refs.)

77215 Giant intrinsic magnetic hardness: Computer simulations on random moment dilution. M.Fahnlé (Inst. fur Phys., Max Planck Inst. fur Metallforschung, Stuttgart, Germany). *Phys. Rev. B (USA)*, vol.27, no.9, p.5586-91 (1 May 1983). Aspects of the phenomenology of giant intrinsic magnetic hardness in systems such as $\text{R}(\text{Co}_{1-x}\text{M}_x)_2$ (R represents lanthanides; M represents Ni, Cu, Al) are treated theoretically on a topological approach. They encompass the extraordinary strength of the domain-wall pinning at cryogenic temperatures, a chemical regularity concerning the concentration dependence of coercivity $H_c^0(x)$ and the so-called Sm-La paradox which represents the experimental experience that the general curve shape of $H_c^0(x)$ is similar in systems with $R=\text{Sm}$ and $R=\text{La}$ although anisotropy fields are dissimilar (while exchange fields are similar). In particular, the Sm-La paradox leads one to consider topological arrangements within the diluted transition-metal sublattice as an important contribution for intrinsic hardness. A Monte Carlo computer simulation based on single spin-tunneling processes is used to describe the giant intrinsic magnetic hardness. The model relates the onset of the steep increase of the $H_c^0(x)$ curves to the percolation concentration of magnetic Co atoms in the diluted transition-metal sublattice. Because the percolation concentration is totally determined by the topology of the lattice, this gives a natural explanation for the Sm-La paradox. The chemical regularity concerning the curve shapes of $H_c^0(x)$ for different elements M is discussed by taking into account the quenching of Co moments when diluting the transition metal sublattice with various M atoms. 75.60L Magnetic aftereffects

77217 Study of magnetic after-effects in the amorphous alloy $\text{Fe}_{40}\text{Ni}_{40}\text{P}_{14}\text{B}_6$. H.Borner, R.Hohne (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.499-503 (16 April 1983). The effect is investigated of repeated annealing treatments on the magnetic diffusion after-effect in the amorphous alloy $\text{Fe}_{40}\text{Ni}_{40}\text{P}_{14}\text{B}_6$ using measurements of disaccommodation and induced magnetic anisotropy. The process of varying the magnitude of the disaccommodation maximum due to annealing at various temperatures is repeatable. It is found that evidently the maximum attainable disaccommodation effect decreases with each annealing cycle. Using the damping of free torsional vibrations of the sample in a saturating magnetic field no relaxation effect of induced magnetic anisotropy may be found. There are given two possibilities of interpretation of the observed behaviour. (9 refs.)

75.60N Magnetic annealing and temperature-hysteresis effects

77218 Magnetization and structural studies on Cu-ferrite. S.R.Sawant, R.N.Patil (Dept. of Phys., Shivaji Univ., Kolhapur, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.3, p.145-7 (March 1983). Molecular magnetization, remanent magnetization, remanence ratio and cation distribution are computed for the slow-cooled and quenched samples of CuFe_2O_4 . A-B interactions are strengthened on quenching the samples. The remanence ratio, however, is unaffected by quenching which is explained as due to the impedance to domain-wall motion. All the samples exhibit almost the same hysteresis loss. The quenched samples show higher permeability and less coercivity. Quenched as well as slow-cooled CuFe_2O_4 samples show tetragonal distortion of the lattice which decreases with the increase of the temperature of quenching. This is explained by cation transfer. (11 refs.)

75.70 MAGNETIC FILMS AND PLATES

77219 Effect of magnetic field in RF sputtering on the crystal orientation and magnetic properties of Co-Cr perpendicular anisotropy films. H.Maeda (Tsukuba Labs., Nat. Res. Inst. for Metals, Ibaraki, Japan). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2429-33 (May 1983). Co-23-wt. %Cr alloy films with thicknesses of 0.3 to 2.5 μm were deposited using a conventional RF diode sputtering system when a magnetic field H_s less than 90 Oe is applied during deposition. As H_s increases, the HCP c -axis orientation normal to the film plane develops and the half-angle width of the rocking curve of the (002) line $\Delta\theta_{50}$ reaches to 3.5 deg at H_s more than 40 Oe. The development of the orientation is strongly related to the concentration of O in the films, which is lower in the films deposited in a magnetic field than those in a nonmagnetic field. The magnetic properties such as perpendicular coercive force $H_{c\perp}$ and saturation magnetisation M_s strongly depend on the substrate temperature rather than H_s . (18 refs.)

77220 Anomalous thickness dependence of the saturation magnetization in Fe-Ni Invar alloy films. M.Konno (Dept. of Phys., Metropolitan Coll. of Technol., Tokyo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1759-64 (May 1983). Invar alloy films with the FCC structure were prepared using the vacuum evaporation technique. Using the thickness graded film in the alloy compositions of 21%NiFe and 36%NiFe, the thickness dependence of saturation magnetization was studied. As the film thickness decreases from 1000 Å to 200 Å, the saturation magnetization of 36%NiFe decreases monotonically and that of 21%NiFe initially increases down to 350 Å, and finally decreases. The temperature dependence of the saturation magnetization of 21%NiFe shows very flatter one compared with that of the theoretical Brillouin function. These results are supposed to be originated not from the existence of the gradient of the composition but from the appearance of γ_2 phase through the interface interaction between the substrate and film.

77221 The variation of magnetic properties of Fe-based amorphous alloys along the ribbon length. T.Sato, T.Ozawa, T.Yamada, R.Matsumoto (Fundamental Res. Labs., Nippon Steel Corp., Kawasaki, Japan). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.205-9 The variation of AC magnetic properties along the length of melt-spun Fe-based amorphous ribbons was examined in relation to the variations of the roller surface temperature and the ribbon thickness. The results indicated that the lengthwise variation of magnetic properties strongly depends both on the roller surface temperature and the ribbon thickness. The critical cooling rates at which core loss begins to increase were determined from the relationship between core loss and cooling rate. For ribbons cast at lower cooling rate than critical cooling rate, the fine-domain patterns were usually observed on the free surface. From the disappearance of the fine-domain pattern and the remarkable decrease of core loss by removal of the surface layers, it is ascertained that the surface layers deteriorate magnetic properties. (2 refs.)

77222 The effects of ribbon thickness and annealing temperature on the AC magnetic properties of the $\text{Fe}_{81.5}\text{B}_{14.5}\text{Si}_2\text{C}_1$ alloy. S.C.Huang, P.G.Frischmann, F.E.Luborsky, J.D.Livingston, A.Mogro-Campero (General Electric Corporate Res. & Dev., Schenectady, NY, USA). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.211-16 The AC magnetic properties measured at 60 Hz are found to be strongly affected by amorphous ribbon thickness and annealing temperature. These magnetic results are further characterized by observation on magnetic domain structure, crystallization, stress relaxation, and ribbon surface finish. (10 refs.)

75.70K Domain structure (magnetic bubbles)

77223 Micromagnetic investigation of stripe domains. A.S.Zhukarev (M.V. Lomonosov State Univ., Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.655-9 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A micromagnetic calculation is made of a two-dimensional distribution of the magnetization in a stripe domain structure of the open type observed in plane-parallel plates and films. The period of the structure and the domain wall thickness are found as a function of the plate thickness and anisotropy parameter. The boundary conditions are formulated for the 'surface' of a domain wall. It is found that a domain wall is charged and twisted, and the twist angle depends on two coordinates. (16 refs.) *A.T.*

77224 Direct observation of domain nucleation in garnet films. V.G.Kleparskii, I.Pinter (Central Res. Inst. for Phys., Hungarian Acad. of Sci., Budapest, Hungary).

Phys. Status Solidi a (Germany), vol.76, no.1, p.K1-4 (16 March 1983). Domain nucleation in garnet films is not only of theoretical but also of practical interest especially for magnetic bubble devices in which controlled domain nucleation is used to introduce new information but if uncontrolled can lead to device failure. The authors described direct observation of the domain nucleation process by the high speed photography method (HSP). Experiments were performed using (Y,Yb,Bi,Gd)₃(Fe,Al)₅O₁₂ film grown by the LPE method on (111)-oriented GGG substrate. (4 refs.)

77225 Problem of the dynamics of nonthrough magnetic bubble domains. A.F.Martynov, V.V.Randoshkin, R.V.Telesnin (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1969-70 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3463-5 (Nov. 1982). [received: May 1983]

The authors have used the method of high-speed photography to study the dynamics of translational motion of nonthrough bubble domains under the action of a pulsed gradient field applied to two-layer ferrite garnet films. The pulsed gradient field was created by a pair of conductors located on the surface of a sample and separated by 160 μ m from one another. The pulse duration was selected so as to ensure that the nonthrough bubble domains were displaced by a distance not exceeding one bubble diameter. Before the measurements the domains were brought to the center between the conductors by applying small-amplitude pulses from the side opposite to their subsequent motion. (4 refs.)

77226 Stabilization of a stripe domain structure in amorphous Co-P films by annealing. L.S.Palatnik, A.G.Ravlik, S.T.Roshchenko, V.N.Samofalov, I.G.Shipkova (V.I. Lenin Polytech. Inst., Kharkov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2113-14 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3706-8 (Dec. 1983).

The authors have investigated amorphous Co-P films with a stripe domain structure, associated with the so-called transverse anisotropy. The domain structure was revealed by the Akulov-Bitter method. At the same time an induction apparatus was used to observe hysteresis loops from which they deduced the saturation field (H_s) and a rotational anisotropy enabled them to determine—from the torque curves—the anisotropy constant in the plane of the film (K_1) and the saturation magnetization (M_s) amounting to 650.10³ A/m (650 G) for the films under investigation. The transverse anisotropy constant was estimated from $K_{\perp} = \mu_0 M_s^2/2$. The influence of macrostresses in the film was minimized by separating the films from the substrates. (4 refs.)

Preparation and magnetic characteristics of garnet films with cylindrical magnetic bubbles in the submicron range See Entry 77563

75.80 MAGNETOMECHANICAL AND MAGNETOELECTRIC EFFECTS, MAGNETOSTRICTION

77227 Magnetostriction of bismuth and graphite in fields up to 40 Tesla. Y.Iye (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), J.Heremans, K.Nakamura, G.Kido, N.Miura, J.-P.Michenaud, S.Tanuma. *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1692-700 (May 1983).

Longitudinal magnetostriction has been measured in bismuth along the binary axis and in graphite along the *c*-axis in pulsed magnetic fields up to 40 T. The field dependence of the magnetostriction of bismuth is compared with theoretical calculations based on a model proposed by Vecchi et al. for the lowest quantum number Landau levels. A better correspondence with the experimental result is obtained by using a set of parameter values recently given by Hiruma et al. rather than the original Vecchi et al.'s values. For graphite, a large and field-superlinear magnetostriction has been found.

77228 Giant cobalt-induced anisotropic magnetostriction in GdCo₂. R.Z.Levitin, A.S.Markosyan, V.V.Snegirev (M.V. Lomonosov State Univ., Moscow, USSR).

JETP Lett. (USA), vol.36, no.10, p.445-8 (20 Nov. 1982). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.367-9 (20 Nov. 1982). [received: June 1983]

An X-ray diffraction analysis of the crystalline structure of the intermetallic compound GdCo₂ was performed in the temperature range 5-500K and giant anisotropic magnetostriction 1×10^{-3} was observed at a temperature 5.5K. From a comparison of X-ray diffraction analyses of the compounds GdAl₂, GdNi₂, and GdFe₂, it is concluded that the anisotropic magnetostriction in GdCo₂ is due to the cobalt. The longitudinal and transverse magnetostriction of GdCo₂ at $T=4.2$ K in pulsed magnetic fields up to 230 kOe is also investigated and the large magnetostriction of the paraprocess, caused by the band nature of the magnetism of cobalt in the compound GdCo₂, is observed. (6 refs.)

77229 Magnetoelastic properties of PrAg. M.Giraud, P.Morin, J.Rouchy, D.Schmitt, E.du Tremolet de Lacheisserie (Lab. Louis Neel, CNRS, Grenoble, France).

J. Magn. & Magn. Mater. (Netherlands), vol.37, no.1, p.83-92 (May 1983). Parastriation and ultrasonic velocity experiments have been performed in order to have a better knowledge of the magnetic and quadrupolar interactions in PrAg, an intermetallic compound (CsCl-type structure) which exhibits puzzling magnetic properties, extensively studied in the recent past. As a first result, the existence of a ferromagnetic transition at $T_c=7.3$ K below the Neel temperature ($T_N=10.5$ K) is confirmed on monocrystalline samples. In all the

ordered range, the magnetic structure is proved to be multiaxial: first the knowledge of the magnetoelastic coefficients allows the authors to rule out the collinear structure, explaining the lack of any spontaneous strain. On the other hand, the quadrupolar interactions, found weakly negative, favour an antiferroquadrupolar arrangement in agreement with a multiaxial spin ordering. The stability of the CsCl-type lattice at low temperature is then discussed in connection with the instability features observed in neighbouring compounds LaAg and CeAg. It appears that in these three compounds many origins may be simultaneously proposed for the instability tendency: an electronic deformation potential coupling, a e_g strain coupling with zone boundary phonon and the magnetoelastic coupling. PrAg appears to be clearly more stable than the other two compounds. (28 refs.)

77230 ΔE effect of a Mn ferrite single crystal at temperatures between 150 and 300K. Y.Kawai, T.Ogawa (Dept. of Phys., Gakushuin Univ., Tokyo, Japan).

Phys. Status Solidi a (Germany), vol.76, no.1, p.375-81 (16 March 1983). The changes of Young's moduli with magnetization (i.e. the ΔE effect) in the [100], [110], and [111] directions of a Mn_{0.87}Fe_{1.13}O₄ single crystal are studied at temperatures between 150 and 300K as a function of the d.c. magnetic field. Two types of ΔE effects in weak magnetic fields are observed. It is found that the effects are closely related to magnetization processes in the specimens. The first type, in which Young's modulus decreases initially and then increases with magnetization, is caused by the displacements of non-180° domain walls, and then is caused by the rotation of magnetization. The second type, in which Young's modulus increases monotonically with magnetization, is caused mainly by the rotation of magnetization. (14 refs.)

77231 Useful relations for highly sensitive sensors based on carrier concentration. A.Chovet, S.Cristoloveanu, Y.Daher (Lab. de Phys. des Composants a Semiconducteurs, Ecole Normale Supérieure d'Electronique et de Radioelectricté, Grenoble, France), V.K.Malyutenko.

Phys. Status Solidi a (Germany), vol.76, no.1, p.K43-8 (16 March 1983). In semiconductor slabs, high current enhancement can be produced by the magnetoconcentration effect when the sensor operates under electric or magnetic fields derive general relations allowing to forecast (according to material properties) the bounds of sensitivity, the optimum slab thickness, the fields to be applied as well as the corresponding carrier concentrations. Moreover it is experimentally evidenced that sensitivities larger than 1500 V/T can be obtained from 100 μ m thick Ge samples. (7 refs.)

77232 Magnetic interactions in plastically deformed Ni₃Mn alloy. S.Takahashi, K.Ikeda (Faculty of Engng., Iwate Univ., Iwate, Japan).

Phys. Status Solidi a (Germany), vol.76, no.1, p.K97-100 (16 March 1983). The modified slip-induced-directional-order model is extended to the magnetic interaction in the cold worked Ni₃Mn alloy. The net magnetisation at 0K versus the dislocation density is estimated. (8 refs.)

77233 Theoretical aspects of magnetoelasticity in transition metals and alloys. M.Shimizu, J.Inoue, Y.Ohta, K.Niwa (Dept. of Appl. Phys., Nagoya Univ., Nagoya, Japan).

Physica B & C (Netherlands), vol.119 B+C, no.1-2, p.3-14 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).

The authors' recent theoretical studies are summarized. The magnetovolume effect in Fe and Ni is discussed and the effects on the volume striction of spin fluctuations are estimated in the paramagnetic state of Fe, Ni, Cr and ZrZn₂. The pressure dependence of the Curie temperature and first-order transition temperature and forced magnetostriction are calculated in a combined model of localized spins and itinerant d-electrons and the observed results for dilute Pd and Pt alloys with Fe, Co and Ni atoms and rare earth-Co₂ compounds are explained. Anisotropic magnetoelastic coupling constants in Fe and deformations of energy levels, Fermi surfaces and density of states due to shear strains in V are calculated in a tight-binding parametrisation scheme. A topological change of the Fermi surfaces due to shear strains is obtained in V. The electronic contribution to elastic shear constants is also calculated. The electronic Grüneisen constant is calculated for Nb and a comparison with experiment is carried out. (53 refs.)

77234 An itinerant-electron theory of Invar effects. H.Hasegawa (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Physica B & C (Netherlands), vol.119 B+C, no.1-2, p.15-20 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).

The spin fluctuation theory for finite-temperature magnetism developed previously by the present author is applied to discuss anomalously strong magnetovolume effects in Invar alloys. Numerical calculations for NiFe alloys show that a large spontaneous volume magnetostriction in the Invar alloy is attributed to a significant reduction in the amplitude of local magnetic moments, (m^2), in the paramagnetic states compared with the ground-state moment. It is also shown that a large $-\partial T_c/\partial P$ is due to a reduction in (m^2) by an applied pressure P and that a large forced magnetostriction arises from a considerable increase in (m^2) by an applied magnetic field H . It is concluded that Invar anomalies originate from non-rigid local magnetic moments whose amplitude varies easily by changing external parameters such as T , P and H . (20 refs.)

77235 Magnetovolume effects in the local-band theory of ferromagnetism: pressure dependence of T_c in iron and nickel. V.Korenman (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).

Physica B & C (Netherlands), vol.119 B+C, no.1-2, p.21-4 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).

In the local-band theory the spontaneous volume magnetostriction and the pressure dependence of T_c are related to one another through their dependence on the volume coefficient of A , the Bloch wall stiffness constant. The available data in iron and nickel are consistent with this relation, and bear a proper relation to the measured energy associated with the phase transition. The author also shows, in the context of a Heisenberg model, that it is short-range order which is mainly responsible for the good agreement. (23 refs.)

77236 Magnetovolume effects in the Moriya-Kawabata theory of very weak itinerant ferromagnetism. D.M.Edwards, C.J.MacDonald (Dept. of Math., Imperial Coll., London, England).

Physica B & C (Netherlands), vol.119 B+C, no.1-2, p.25-9 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).

The Moriya-Kawabata theory is extended to include the effect of pressure and to discuss magnetovolume effects, particularly in the neighbourhood of T_c . It is found that the volume strain $\omega(T)$, relative to the paramagnetic state at $T=0$, satisfies $\omega(T_c)/\omega(0)=\eta(T_c)$ where $\eta(T_c)$ is the ratio of the mean squared local moment at T_c to that at $T=0$. However $\eta(T_c)>1$ so that no negative magnetic contribution to the thermal expansion exists in this theory and the Invar effect frequently observed in very weak itinerant ferromagnets

is not explained: It is found that the pressure dependence of T_c is given by $T_c \propto (1-P/P_c)^{3/4}$. (19 refs.)

77237 Electron-phonon interaction model for the relation between magnetic and elastic properties in itinerant electron ferromagnets. D.J.Kim (Dept. of Phys., Aoyama Gakuin Univ., Tokyo, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.30-6 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
By pursuing the role of the exchange interaction between electrons in the screening of the ion-ion interaction in a metal, the author recently showed how directly the magnetic properties of the metal are reflected on the elastic properties such as phonon frequency and sound velocity. Now he asks the opposite question: Is it necessary to consider the electron-phonon interaction (EPI) in understanding the magnetic properties of a metal? The author finds it essential to consider EPI; by the effect of EPI, in the paramagnetic state of an itinerant electron ferromagnet the spin susceptibility is made Curie-Weiss-like, and in the ferromagnetic state the magnetization can be reduced by as much as $\sim 1 \mu_B$ per atom. These findings offer a comprehensive fundamental viewpoint to discuss the relation between the elastic and magnetic properties in itinerant electron ferromagnets. (10 refs.)

77238 High-pressure effects on the $2k_F$ and $4k_F$ transitions in the quasi-one-dimensional magnetic conductor MEM-(TCNQ)₂. D.Bloch, J.Voiron (Lab. Louis Neel, CNRS, Grenoble, France), C.Vettier, J.W.Bray, S.Oostra. *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.43-50 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
MEM-(TCNQ)₂ possesses at room pressure both an electronic transition, associated with a $4k_F$ lattice distortion and a magnetic-to-non-magnetic transition associated with a $2k_F$ lattice distortion. The high-pressure phase diagram, determined from neutron scattering, electrical transport, and magnetization experiments, indicates a disappearance of both the $2k_F$ and $4k_F$ distortions above 4 kbar. (28 refs.)

77239 Thermal expansion of Cr and Cr-V alloys. R.B.Roberts, G.K.White (CSIRO Div. of Appl. Phys., Sydney, Australia), E.Fawcett. *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.63-7 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
At low temperatures, the linear expansion coefficient α of a Cr+0.5% V alloy is similar to that of chromium, i.e. $10^{-6} \alpha = -37 \pm 0.02 \text{ } ^\circ\text{K}^{-1}$ ($T < 30\text{K}$), giving an electronic and/or magnetic Grüneisen parameter $\gamma_{em} \approx -10$. For the non-magnetic alloy Cr+5% V, $10^{-6} \alpha = 11 \pm 0.03 \text{ } ^\circ\text{K}^{-1}$ and $\gamma_{em} \approx 2.0$. At higher temperatures, $\alpha(T)$ for the 5% alloy increases monotonically and is significantly larger than for pure Cr up to 520K; $\alpha(T)$ for the latter shows a negative cusp at 311K with a first-order transition. (22 refs.)

77240 Thermal expansion of ZrZn₂. S.Ogawa (Electrotech. Lab., Ibaraki, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.68-71 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
Thermal expansion of the weak itinerant electron ferromagnet ZrZn₂ has been measured in the temperature range 10 to 260K. An analysis was made to separate a magnetic contribution to thermal expansion. It is concluded that there is a positive magnetic thermal expansion in the paramagnetic state in addition to a negative one in the ferromagnetic state. (13 refs.)

77241 Thermal expansion and specific heat anomalies in UPt below the ferromagnetic ordering temperature. C.F.Kamma, P.H.Frings, J.C.P.Klaasse, J.J.M.Franse (Naturkundig Lab., Univ. van Amsterdam, Amsterdam, Netherlands). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.72-7 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
Thermal expansion, AC susceptibility and specific heat measurements in UPt below the ferromagnetic transition temperature ($T_c \approx 27\text{K}$) reveal an additional transition of magnetic origin near 19K, possibly indicating a change in the magnetic spin structure. The coefficient of thermal expansion is negative below 6K and points to a decrease of the intrinsic value of the magnetic moment with increasing temperature. The value for the magnetovolume parameter, derived from forced magnetostriction and magnetization measurements at 4.2K, is close to the results obtained for 3d metals. (13 refs.)

77242 Thermal expansion measurements in Fe-base Invar alloys. F.Ono, T.Kittaka (Coll. of Liberal Arts & Sci., Okayama Univ., Okayama, Japan), H.Maeta. *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.78-83 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
By using the X-ray bond method, measurements of thermal expansion curves have been made in Fe-Ni and Fe-Pd Invar alloys in the temperature range between 4.2K and room temperatures. A minimum in the thermal expansion curve was observed for each alloy. This anomaly could be explained by considering the magnetovolume coupling term caused by the longitudinal spin fluctuation and the contribution due to the anharmonic terms in the normal lattice vibration energy. In 34.2 at% Pd-Fe alloy an abnormal increase of the linewidth of the (400) X-ray peak was observed with decreasing temperature from room temperature down to 4.2K, while in Fe-Ni and Fe-Pt Invar alloys no such increase in linewidth was observed. (23 refs.)

77243 Invar anomalies of Fe-Pd alloys. M.Matsui, T.Shimizu, K.Adachi (Dept. of Iron & Steel Engng., Nagoya Univ., Nagoya, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.84-9 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
The Mossbauer spectra and the magnetostriction have been observed for Fe_{1-x}Pd_x alloys. The internal field of Fe atoms is $330 \pm 10 \text{ kOe}$ and is almost constant in the Invar region $0.45 \leq x \leq 0.3$. The magnetostriction constants as well as forced magnetostriction ($\partial\omega/\partial H$) increase with decreasing temperature and with decreasing x . Observed large values of magnetostriction constants are related to a lattice instability of the FCC structure, which is confirmed by the measurement of elastic constants. The magnitude of $\partial\omega/\partial H$ is about one-fifth of Fe-Ni Invar. The thermal expansion of Fe_{1-x}Pd_x alloys has also been measured in the whole concentration range. The Invar-like behavior observed in the region $0.28 \leq x > 0$ originates from an annealing effect of the martensite BCC phase. The spontaneous volume magnetostriction in the FCC region increases with decreasing x . The thermal expansion coefficients (α_{exp}) of FCC alloys are analyzed from the Grüneisen equation. The high-temperature anomaly of α_{exp} is discussed. (13 refs.)

77244 Contribution of the temperature change in the local magnetic moment to the Invar effect. O.Yamada (Dept. of Phys., Okayama Univ., Okayama, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.90-5 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
The mean value of the local magnetic moment $M_{loc}(T)$ of Invar alloys at a finite temperature T can be practically expressed by $M_{loc}(T) = M_0(1 - ST^2)$, where M_0 is the magnetization at 0K and S is the coefficient of the T^2 term or the Stoner excitation term. The essential mechanism of the Invar effect is the volume contraction due to the decrease of $M_{loc}(T)$ and not of $M(T)^2$. The magneto-volume coupling constant C has been found to be $1.1\text{--}1.3 \times 10^{-8} \text{ cm}^3/\text{emu}^2$, almost the same value for Fe-base Invar alloys, by experiments on forced volume magnetostriction, thermal expansion coefficients and pressure effects on magnetization. (46 refs.)

77245 Elastic anomaly in an itinerant-electron antiferromagnet. H.Yamada (Dept. of Phys., Gifu Univ., Gifu, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.99-108 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
The anomalous temperature dependence of an elastic constant c_{11} in antiferromagnetic metals, say FCC Mn alloys, is studied. The c_{11} is generally written in terms of a wave-vector dependent electron density susceptibility. This susceptibility in an itinerant-electron antiferromagnet may be calculated by using the extended random phase approximation including the exchange interaction. By numerical calculations in the tight-binding single band approximation, it is shown that c_{11} decreases with increasing energy gap caused by the antiferromagnetic spin ordering both in FCC and BCC lattices. Especially for an FCC antiferromagnet with relatively large e/a ratio, there exists a certain critical value of the energy gap where c_{11} becomes zero as the temperature is reduced from the Neel temperature T_N . For a BCC antiferromagnet, there appears a remarkable gap of c_{11} at T_N . In such an anomalous behaviour of c_{11} the exchange interaction between the itinerant electrons plays a particularly important role. (25 refs.)

77246 Anomalous elastic properties of Fe-Ni (FCC) alloys and their Invar properties. Y.Tanji, Y.Nakagawa, S.Steinemann (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.109-14 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
The authors have measured the elastic properties of Fe-Ni (FCC) alloys over the whole concentration range between 25 and 1150°C, and have found that the concentration dependence shows an anomalous behaviour in the Invar range even at 1000°C. The anomaly suggests the existence of a chemical miscibility gap in the Invar range of the γ phase. The instability of the γ phase is examined based on Cahn's spinodal theory. It is unlikely that the two-phase separation easily takes place by spinodal decomposition. (24 refs.)

77247 Low-temperature elastic-constant anomalies in Fe-Cr-Ni-Mn alloys. H.M.Ledbetter (Fracture & Deformation Div., NBS, Boulder, CO, USA). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.115-18 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
By measuring velocities of longitudinal and shear waves the author determined accurately the temperature variation of elastic constants—Young's modulus, shear modulus, bulk modulus, Poisson ratio—of a polycrystalline austenitic steel: Fe-5Cr-26Mn. Versus temperature, near 335K, this alloy exhibits an anomalous elastic-constant transition. In similar alloys, a magnetic-susceptibility cusp occurs at the transition temperature, T_c . The bulk modulus shows a maximum at a higher temperature. Below T_c , the Poisson ratio behaves anomalously, increasing with decreasing temperature. (17 refs.)

77248 Magnetoelastic effect in dilute Fe-Co alloys. S.Ishio, A.Isomura, T.Ikeda, M.Takahashi (Dept. of Appl. Phys., Tohoku Univ., Sendai, Japan), S.Kadowaki. *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.119-24 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982).
Elastic constants, c_{11} , c_{33} , c_{55} and c_{66} , of Co, 0.84 at% Fe-Co and 1.37 at% Fe-Co alloys were measured by the pulse-echo-overlap method in magnetic fields up to 20 kOe over the temperature range from room temperature to 400°C. The dependence of elastic constants upon magnetic field orientation and intensity was examined in detail. The results are discussed on the basis of the macroscopic consideration of magnetoelastic energy. (13 refs.)

77249 The magnetoelastic effect in iron-manganese spinels. E.V.Babkin, E.S.Mushalov, V.G.Pyn'ko (L.V. Kirenskiy Phys. Inst., Acad. of Sci., Krasnoyarsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1403-4 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2285-6 (Nov. 1982). [received: May 1983]
The authors note that the magnetoelastic effect in a magnetic semiconductor should only be observed for appropriate sample dimensions ($\sim \lambda$, where λ is the Debye screening length) when the external electric field is sufficiently intense. These conditions can be satisfied by placing a thin layer of sample in an electric field produced by bound surface charges on a dielectric. The samples consisted of polycrystalline ferrite-spinel $\text{Mn}_{1-x}\text{Fe}_x\text{O}_4$ films of thickness 1 μm . The magnetic properties were measured in a magnetometer which measured the applied torques. The authors measured the dependence of the saturation magnetization on the potential difference applied to the copper films for a series of samples. The results may be summarized as follows: The existence of a nonzero electric field in the spinel increases the bulk conduction electron density and the magnetization; when the polarity of the electric field is reversed, no increase in the magnetization is observed to within experimental error. The technique is used to observe the magnetoelastic effect in $\text{Mn}_{1-x}\text{Fe}_x\text{O}_4$ when (for the particular sample) a negative voltage is applied. The failure of the magnetization to increase when a positive potential difference is applied is probably due to the absence of space charge in the spinel. (6 refs.)

75.90 OTHER TOPICS IN MAGNETIC PROPERTIES AND MATERIALS

77250 Dynamics of the shape transition of a magnetic ferrofluid drop. J.-C. Bacri, D. Salin (Lab. d'Ultrasons, Univ. Pierre et Marie Curie, Paris, France). *J. Phys. Lett. (France)*, vol.44, no.11, p.415-20 (1 June 1983). The prolate ellipsoidal shape of a magnetic fluid drop becomes unstable at a certain magnetic field threshold; the drop jumps from a slightly elongated shape to a much more elongated shape. The authors describe theoretically the dynamics of this first order transition, i.e. the relaxation time of this instability around the critical magnetic threshold. The critical divergence of the characteristic time of this instability, that they have measured in ferrofluid magnetic drops, is in reasonable agreement with the theoretical model. (12 refs.)

76.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

77251 Laser-polarimetric investigations of electron spin resonance and relaxation in glasses. A.A. Antipin, V.S. Zapasskii, S.G. Lunter. *Sov. Phys. Solid State (USA)*, vol.24, no.11, p.1843-6 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3248-54 (Nov. 1982). [received: May 1983]

An optical method for recording ESR was used to investigate glassy matrices activated with paramagnetic ions. Changes in the Faraday rotation angle on saturation of ESR were detected using a highly sensitive polarimeter based on an argon-ion laser. The ESR spectra were determined for all paramagnetic (in the ground state) trivalent rare-earth ions and some ions of the iron group. Preliminary measurements were made of the longitudinal relaxation time of the magnetization of glasses and several features were noted of the relaxation processes of glasses containing paramagnetic impurity centers, compared with the corresponding properties of activated crystals. (11 refs.)

77252 Effect of the profile of an inhomogeneously broadened ESR line on the steady-state distribution of the Zeeman temperature under saturation conditions. S.V. Pogrebnyak, E.A. Shadchin (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys. Solid State (USA), vol.24, no.12, p.2114-15 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3708-10 (Dec. 1983). The authors investigate the effect of the profile of an inhomogeneously broadened ESR line on the distribution of the Zeeman temperature in the case of saturation due to a high-frequency field $[H(t) = 2H_1 \cos \omega_0 t]$. (4 refs.)

76.30F Iron group (3d) ions and impurities (Ti-Cu)

77253 EPR study of Cu^{2+} ions in single crystal of strontium formate dihydrate. M. Umar, M.I. Haque, R.J. Singh (Dept. of Phys., Aligarh Muslim Univ., Aligarh, India).

J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.825-8 (May 1983). Electron paramagnetic resonance of Cu^{2+} ion in $\text{Sr}(\text{HCOO})_2 \cdot 2\text{H}_2\text{O}$ were measured at room temperature. The spectrum was interpreted in terms of the Jahn-Teller effect. Cu^{2+} is found to be incorporated both interstitially and substitutionally. The substitutional Cu^{2+} is found to be in nearly cubic environment and Γ_5 distortion is responsible for Jahn-Teller effect. The interstitial Cu^{2+} finds itself in an octahedral field which undergoes Jahn-Teller splitting due to Γ_3 coupling.

77254 Light-induced ESR centres in single crystal rutile. S.W. Hodgskiss, J.S. Thorp (Dept. of Appl. Phys. & Electronics, Univ. of Durham, Durham, England).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.303-9 (April 1983). Electron spin resonance studies have been made on Verneuil-grown rutile single crystals, which were doped with a variety of transition group ions. Measurements were made at 9 GHz, both before and after UV irradiation, at temperatures in the range from 4.2 to 300K. UV irradiation had two effects: (a) to affect the relative intensities of ESR lines due to species already present, (b) to generate new ESR spectra. Both effects are interpreted as representing a redistribution of charge amongst trapping centres. Seven UV generated centres have been identified and characterised in terms of their spin Hamiltonian parameters. Isochronal annealing techniques have been used to determine the ionisation temperatures of the traps. Observation of interactions and charge transfers between centres during isochronal annealing was used to determine the polarity and type of each centre. (15 refs.)

77255 EPR and luminescence of Mn^{2+} in distorted tetrahedral symmetry in CaZnF_4 crystals. M. Heming (Inst. fur Phys. Chem., Westfälischen Wilhelms-Universität Münster, Münster, Germany), G. Lehmann, K. Recker, F. Wallrafen.

Phys. Status Solidi b (Germany), vol.117, no.1, p.271-6 (1 May 1983). Small crystals of CaZnF_4 with scheelite-type structure, doped with about 1% Mn, are obtained from the melt by the Bridgman method with subsequent annealing at 725°C, 50K below a reversible phase transformation detected by DTA. Mn^{2+} exclusively occupies Zn sites as evident from the size of the hyperfine splitting constant. The intrinsic zero field splitting parameter of second order obtained from superposition analysis is in the same range as that for $[\text{MnF}_6]^{4-}$ units. The luminescence spectra do not serve as a critical test for distinction between four- and eightfold coordination. (12 refs.)

77256 EPR study of ordering in stoichiometric β -aluminate. Ph. Colombeau, D. Vivien (Lab. de Chimie Appl. de l'Etat Solide, Ecole Nat. Supérieure de Chimie, Paris, France).

Phys. Status Solidi a (Germany), vol.76, no.2, p.565-74 (16 April 1983). Single crystals of nonstoichiometric ammonium β -aluminate doped with Mn^{2+} ions are investigated by EPR. In the starting material, the nonobservation of the outer fine structure transitions and the existence of forbidden hyperfine lines along the D tensor axis results from disorder in the spinel blocks caused by Frenkel defects at the Al_1 site. The manganese ions lie mainly on the Al_2 'block tetrahedral' site. In stoichiometric oxonium β -aluminate obtained by thermal treatment of the starting material (500°C) exists a partial resolution of the Mn^{2+} fine structure as a consequence of the relaxation of the Frenkel defects and of ordering. There is also evidence of at least three kinds of manganese sites. Treatments at 800°C leads to well-resolved spectra with $D = -0.0253 \text{ cm}^{-1}$ characteristic of manganese in well-ordered spinel blocks. The stacking of these spinel blocks is disordered, and the structure of the material ('3a phase') is related to those of the transition alumina group. This study shows that Mn^{2+} EPR spectroscopy is a sensitive way to investigate the structural transformations of single crystalline solids, and the degree of ordering of the structures. (24 refs.)

77257 Electron-spin resonance study of spin dynamics in the one-dimensional magnetic crystal doped with diamagnetic impurities $(\text{CH}_3)_4\text{NMn}^{2+}\text{Cl}_3\text{Cd}^{2+}$. N. Shah, G. Kemmerer, J.S. Karra (Dept. of Phys., Temple Univ., Philadelphia, PA, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5360-S (1 May 1983). The authors have studied spin dynamics in the impurity-doped $(\text{CH}_3)_4\text{NMn}^{2+}\text{Cl}_3\text{Cd}^{2+}$ using electron-spin resonance. They have measured the room-temperature electron-spin resonance linewidths, lineshapes, dynamic shifts, and fine- and hyperfine-structure constants at X- and Q-band microwave frequencies in several crystals containing different concentrations of Cd^{2+} ion. They have attempted to interpret their data with the aid of the current theories and found that there is only partial agreement between theory and experiment. At very high concentration of Cd^{2+} they have observed fine structure due to single-ion anisotropy and hyperfine structure due to nuclear spin of Mn^{2+} , at $\theta = 0^\circ$, where θ is the angle between the magnetic chain axis (c axis) of the crystal and the constant magnetic field H_0 . The crystal field direction of the single-ion anisotropy was observed to be along the c axis of the crystal. In addition, they have observed hyperfine interaction to be isotropic. They have measured the values of the fine- and hyperfine-interaction constants. (8 refs.)

77258 ESR of Cu^{2+} in the high pressure form of $\text{Ce}_3(\text{PO}_4)_2$. S.S. Romdhane (Lab. de Chimie Minérale, ENIG, Gabes, Tunisia), G. Bacquet.

Solid State Commun. (USA), vol.46, no.8, p.631-2 (May 1983). ESR spectra of polycrystalline Cu^{2+} doped samples of the high pressure phase of $\text{Ce}_3(\text{PO}_4)_2$ were characteristic of the existence of two different paramagnetic centres. The spin-Hamiltonian constants of both defects were determined. Only two of the three possible substitutional cation sites are occupied by copper ions. (6 refs.)

77259 Nonlinear effects in hypersound propagation within the $\text{Ni}^{2+}:\text{Al}_2\text{O}_3$ system. E.M. Gananolskii, D.N. Makovetskii.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.722-31 (May 1983). In Russian. The nonlinear spin-phonon interaction in $\text{Ni}^{2+}:\text{Al}_2\text{O}_3$ crystals has been investigated experimentally at liquid helium temperatures both under acoustic paramagnetic resonance (APR) and phaser amplification conditions. An effect of hypersound self-focusing (HS) in the nonlinear APR regime is revealed. Such a type of HS is conditioned by formation of a gradient paramagnetic medium in the $\text{Ni}^{2+}:\text{Al}_2\text{O}_3$ system having a comparatively long spin-lattice relaxation time, $\tau_1 \approx 10^{-2} \text{ s}$. It is shown experimentally that HS exists in an active medium too, but the phase amplification line has a much more complicated structure than the inverted APR line. A model based on analysis of the hypersound resonant dispersion in the phaser is suggested for the HS effect in the active medium. (13 refs.)

77260 Electric field effect in the case of cubic Gd^{3+} centers in BaF_2 . N. Guskos, I.Kh. Salikhov, S.N. Arkhipov (Tech. Univ., Szczecin, Poland).

Sov. Phys. Solid State (USA), vol.24, no.11, p.1912-14 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3366-9 (Nov. 1982). [received: May 1983]

An investigation was made of the influence of an electric field on the ESR spectra of cubic Gd^{3+} centers in a BaF_2 crystal. The experimental results were interpreted by the appearance of a crystal field harmonic $\Delta V_0^0(E)$ induced by an external electric field. The corresponding parameter of the spin Hamiltonian was $\Delta B_0^0 = (-7.5 \pm 2.5) \times 10^{-7} \text{ cm}^{-1}$ in a field of $E = 355 \text{ kV/cm}$. A calculation carried out using the model of superposition and the experimental data on the uniaxial compression and a calculation made in the approximation of a quasi-molecular model of an impurity center both gave results in agreement with the experimental data. (20 refs.)

77261 Electron-spin-echo experiments on the one-dimensional conductor $[(\text{fluoranthene})]^{+}[(\text{PF}_6)(\text{SBF}_6))_{1-x}]$ ($x \approx 0.5$). J. Sigg, Th. Priser, K.P. Dinse, H. Brunner, D. Schweitzer, K.H. Hauser (Abteilung für Molekulare Phys., Max-Planck-Inst. für Medizinische Forschung, Heidelberg, Germany).

Phys. Rev. B (USA), vol.27, no.9, p.5366-73 (1 May 1983). The electron-spin-echo decay function was determined for the conducting phase $[(\text{C}_{16}\text{H}_{10})]^{+}\text{X}^{-}$ in the temperature range 183-300K. The decay function exhibited an $\exp[-(\gamma t)^{3/2}]$ dependence, characteristic of one-dimensional spin diffusion. The ratio $5 \times 10^3 \leq D_{\parallel}/D_{\perp} \leq 5 \times 10^8$ for the inner-stack-to-out-of-stack diffusion rates was determined from the characteristic time t_0 , at which the electron-spin-echo decay function changed to the 'conventional' $\exp(-2\gamma t)$ form. The deduced value $2 \times 10^{13} \leq D_{\parallel} \leq 2 \times 10^{16} \text{ rad/s}$ is consistent with the bulk DC conductivity and with recently determined nuclear spin-lattice relaxation rates. The overall assumption of highly mobile electronic spins was confirmed by an Overhauser-type experiment. (22 refs.)

76.30M Colour centres and other defects

77262 Li tunneling effects on spin-lattice relaxation rates of a color center in CaO:Li. D.G.Stinson, H.J.Stapleton (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5386-93 (1 May 1983). Low-temperature spin-lattice relaxation rates of the $[F_{Li}]^0$ center in single crystals of CaO:Li at X- and Ku-band microwave frequencies exhibit an anisotropy in the functional form of the temperature dependence: from T in the [100] direction to $cosh(25/T)$ in the [111] direction. A model involving longitudinal and transverse tunneling of a Li ion adjacent to the trapped electron can qualitatively explain this and most of the other characteristics of the relaxation data, with the exception of the hyperfine dependence. 76.30P Conduction electrons

77263 Combined effects of exchange and g-value anisotropy in the conduction-electron spin resonance of metals. R.H.Silsbee (Dept. of Phys., Cornell Univ., Ithaca, NY, USA), J.P.Long. *Phys. Rev. B (USA)*, vol.27, no.9, p.5374-85 (1 May 1983). A heuristic model is developed to explore the combined effects of exchange and g-value anisotropy in the conduction-electron spin resonance in polyvalent metals where it may be appropriate to consider the electrons in different Brillouin zones to be partially decoupled from one another. Within the framework of this model the resonance should show structure at low temperature, and the conventional analysis of resonance data, using the theory of Platzman and Wolff (1967) to obtain the exchange parameter B_0 , can be substantially in error if the effects of g-value anisotropy are not properly accounted for. Some features of existing data for aluminum are discussed in the context of this model, and it is noted that spin-resonance results may be able to remove the current ambiguity in the sign of the pseudopotential matrix element V_{111} used in calculations of the band structure of aluminum. 76.40 DIAMAGNETIC AND CYCLOTRON RESONANCES

77264 Theory of cyclotron resonance width for electrons inelastically scattered by phonons. T.K.Srinivas, S.Chaudhury, S.Fujita (Dept. of Phys. & Astron., State Univ. of New York, Buffalo, Amherst, NY, USA). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.417-21 (1983). The cyclotron resonance width for a semiconductor under extreme high fields is calculated with the assumptions that electrons are scattered by acoustic phonons inelastically. The numerical results are in very good agreement with the recent experiments on Ge by Miura et al. (1976) ($T \sim 300K$, $B \sim 97$ tesla). The energy-dependent widths arising from the relaxation processes with absorption and emission of a phonon show quite distinctive behaviors at low electron energies. At extreme low temperatures when few phonons are present, the width arising from the zero-point motion of the lattice is finite but very small. The charged-impurity scattering with the density as low as 10^{12} cm^{-3} numerically dominate the width due to the electron-phonon interaction below 10K. The present theory supplements the previous work by Suzuki et al. (1980) where the elastic-scattering and high-temperature approximation were used. (9 refs.)

77265 Cyclotron resonance and the role of polaron effects in surface layers on Hg_{1-x}Cd_xTe. J.Scholz, F.Koch (Phys.-Dept. Tech. Univ. Muenchen, Garching, Germany), J.Ziegler, H.Maier. *Solid State Commun. (USA)*, vol.46, no.8, p.665-8 (May 1983). The authors examine the cyclotron resonance of electrons in surface subbands on Hg_{1-x}Cd_xTe at frequencies in the range of the optical phonon modes. Polaron effects on the surface resonance are shown to be significantly smaller than the polaron shift and broadening of the bulk electron resonance. (21 refs.)

77266 Theory of cyclotron resonance lineshape for electron-phonon systems in two coupling schemes. Sang Don Choi, Ok Hec Chung (Dept. of Phys., Kyungpook Nat. Univ., Taegu, Korea). *Solid State Commun. (USA)*, vol.46, no.9, p.717-20 (June 1983). A theory of cyclotron resonance lineshape due to electron-phonon interactions is presented on the basis of the projection operator method introduced by Argyres and Sigel (1974). In addition to the extremely weak coupling scheme dealt with earlier, the moderately weak coupling scheme is included in the theory. The lineshape functions derived in the two schemes are similar to Lodder-Fujita's formula (1968) and are reduced to Kawabata's formula (1967) in the elastic scattering approximation. (5 refs.)

76.50 FERROMAGNETIC, ANTIFERROMAGNETIC, AND FERRIMAGNETIC RESONANCES; SPIN WAVE RESONANCE (see also 75.30D Spin waves)

77267 Epitaxial growth and annealing control of EMR properties of thick homogeneous Ga substituted yttrium iron garnet films. P.Roschmann, W.Tolksdorf (Philips GmbH Forschungslab., Hamburg, Germany). *Mater. Res. Bull. (USA)*, vol.18, no.4, p.449-59 (April 1983). Homogeneous, 30 μm to 70 μm thick Ga substituted yttrium iron garnet films have been grown on Y or Al substituted gadolinium gallium garnet substrates having lattice parameters matched to that of the films. Resonance field and FMR linewidth measurements as a function of frequency and annealing experiments revealed that the magnetization and cubic anisotropy of the films are identical to data from flux grown bulk single crystals; the FMR losses of the films are only slightly higher. For films grown with supercooling, $\Delta T < 50^\circ\text{C}$, a negative, growth induced, uniaxial anisotropy was found which

could be removed by annealing in air at 1100°C. A compensation of the temperature drift of the FMR frequency can be adjusted in the Ga substituted films by changing the frozen-in Ga-Fe cation distribution by annealing and quenching from different temperatures $> 800^\circ\text{C}$. (24 refs.)

77268 Influence of ion implantation on high-frequency properties of domain walls in thin magnetic films. A.V.Zinovuk, A.F.Kononov, I.A.Mel'nichuk, L.I.Prikhodko, E.I.Filippov, E.F.Khodosov (Physicotech. Inst., Acad. of Sci., Donetsk, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1967-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3461-3 (Nov. 1982). [received: May 1983]

The authors have used the RF method to study the influence of ion implantation on high-frequency properties of domain walls in epitaxial iron garnet systems (Eu, Tm, Y, Ca)₃(Fe,Ge)₅O₁₂ and (Y, Sm, Lu, Ca)₃(Fe, Ge)₅O₁₂ grown on gadolinium gallium garnet substrates cut along a (111) plane. The influence of ion implantation on resonance properties of domain walls was determined by comparing the high-frequency properties of these walls in films of the same composition and the same internal parameters which were either implanted or nonimplanted. (7 refs.)

76.60 NUCLEAR MAGNETIC RESONANCE AND RELAXATION

77269 An ²⁷Al NMR study of complexes between Al³⁺ and imidazolidine-2-one in concentrated aqueous solution. R.Caminiti, A.Lai, G.Saba, G.Crisponi (Univ. di Cagliari, Cagliari, Italy). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.2, p.180-4 (13 May 1983). The complexation between Al³⁺ and imidazolidine-2-one was investigated by ²⁷Al NMR spectroscopy at variable temperature. Several complexes with different stoichiometries were identified. A fitting procedure based on the exchange modified Bloch equations and the Gauss-Newton method furnished the populations and exchange rates. From these the pertinent thermodynamic parameters were found. (19 refs.)

77270 Electron localization on defects and optical nuclear polarization in disordered and semimagnetic semiconductors. N.T.Bagraev (A.F. Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.367-79 (1 May 1983). Using optical nuclear polarization (ONP) and nuclear magnetic resonance (NMR) techniques silicon single crystal solid solutions containing impurity defects of more than one kind are studied. The application of the ONP techniques to the investigation of nonuniformly doped silicon is demonstrated. The concentration and energy fluctuations of donor levels are determined in silicon doped with elements of III to V and transition groups. Solid solution decay processes are studied by ONP techniques in silicon crystals doped with deep-level impurities. Finally, the ONP technique is applied to the investigations of semimagnetic semiconductors. (21 refs.)

77271 Temperature-dependent nuclear magnetic resonance in CuInX₂ (X=S,Se,Te) chalcopyrite-structure compounds. K.D.Becker (Inst. fur Phys. Chem. und Elektrochem., Univ. Hannover, Hannover, Germany), S.Wagner. *Phys. Rev. B (USA)*, vol.27, no.9, p.5240-9 (1 May 1983). The NMR spectra of ⁶³Cu and ¹¹⁵In in CuInS₂, CuInSe₂, and CuInTe₂ have been measured between room temperature and 550°C. The effects of motional narrowing and of phase transitions on the shape and width of the absorption spectra were evaluated. In all three compounds, the absorption signal of ⁶³Cu shows motional narrowing. For Cu_{1.00}In_{1.00}S_{2.00} the mean jump frequency of the Cu²⁺ ions, $\nu(\text{Cu}^{2+})$, is $2 \times 10^{13} \exp[-(1.25 \pm 0.10 \text{ eV})/kT] \text{ s}^{-1}$. For both CuInSe₂ and CuInTe₂, $\nu(\text{Cu}^{2+})$ is about $3 \times 10^{13} \text{ s}^{-1}$ at 350°C. In copper-deficient Cu_{0.96}In_{1.02}S_{2.00} no motional narrowing of the ⁶³Cu absorption was observed up to 550°C. However, the ⁶³Cu line shape in CuInS₂ depends on the copper-to-indium ratio. A line-shape analysis as a function of composition shows that, at 450°C, CuInS₂ exists in the composition range between Cu_{1.00}In_{1.00}S₂ and Cu_{0.85}In_{1.05}S₂. For specimens with $[\text{Cu}]/[\text{In}] > 1$, Cu₂S contributes to the absorption signal. In a separate study of the ⁶³Cu absorption in Cu₂S, the hexagonal-to-cubic transformation was observed at 440°C. The activation energy for $\nu(\text{Cu}^{2+})$ in cubic Cu₂S is 0.15 eV. The phase-transformation temperatures for the three CuInX₂ compounds (where X is a group-VI element) were determined by differential thermal analysis. A previously unnoticed transformation was found in CuInSe₂ at 665°C. Finally, the quadrupole coupling constant $X_Q(^{63}\text{Cu})$ of a number of Cu₂X₂ compounds (where Z is a group-III element) is shown to be a linear function of the tetragonal distortion parameter $\delta = 2 - c/a$ with $|X_Q| = 1.50 + 90\delta$ MHz. The value for $\delta = 0$ is of the same order of magnitude as the result of a simple model of a point charge on a cubic lattice. (27 refs.)

77272 Amplitude-fluctuation effects on magnetic-resonance line shape and soliton density in incommensurate systems. R.Blinc, P.Prelovsek (Dept. of Phys., J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia), R.Kind. *Phys. Rev. B (USA)*, vol.27, no.9, p.5404-11 (1 May 1983). The magnetic-resonance line shape in one-dimensionally modulated structurally incommensurate systems has been evaluated for the case of a multisoliton lattice taking into account both phase and amplitude variations in space. Amplitude variations significantly affected the NMR line shape outside the 'plane-wave' regime. A comparison is made between the temperature dependence of the average incommensurate wave vector and the soliton density in the constant-amplitude approximation and in the case when the amplitude variations are taken into account. (10 refs.)

77273 Behavior of the NMR lines coupled by cross relaxation under acoustic saturation conditions. M.M.Shakirzyanov (Physicotech. Inst., Acad. of Sci., Kazan, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.12, p.2105-6 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3694-6 (Dec. 1983). The author investigates systematically the effect of cross relaxation on the acoustic saturation of nuclear spin systems with nonequidistant spectra. He concludes that, under certain conditions, the cross relaxation effect has a strong influence on the acoustic saturation of NMR lines. It follows that, when the spin-phonon interaction in crystals is studied by acoustic saturation methods, it is necessary to take into account the possible influence of cross relaxation transitions. (7 refs.)

77274 Solid-state high-resolution ^{29}Si NMR in zunyite. A.-R.Grimmer, F.Von Lampe (Central Inst. of Inorganic Chem., Acad. of Sci., Berlin, Germany), M.Tarmak, E.Lippmaa.

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.185-7 (13 May 1983). High-resolution ^{29}Si NMR spectra of zunyite $\text{Si}_2\text{Al}_3\text{O}_{20}(\text{OH},\text{F})_8\text{Cl}$ have been studied by magic-angle sample spinning in combination with high-power proton decoupling and polarization transfer. The isotropic ^{29}Si chemical shift depends mainly on the number of Si-O Si bridges and the bond angles in these bridges connecting the different SiO_4 tetrahedra. (14 refs.)

77275 ^1H and ^{13}C NMR of the chloride of tricyclopentadienyluranium IV. Evolution of the contact shift. G.Folcher, G.Langlet, P.Rigny (Dept. de Phys.-Chimie, CENS, Gif-sur-Yvette, France), A.Dormond.

Nouv. J. Chim. (France), vol.7, no.4, p.245-8 (April 1983). In French. The NMR study of $(\eta^5\text{-C}_5\text{H}_4\text{CH}_2\text{C}_6\text{H}_4)_3\text{UCl}$ I allowed the authors, knowing the solid state structure, to analyse the paramagnetic induced shift. The pseudocontact values corresponding to the various atoms of the ligand show that the structure of the solid is maintained in solution not only for I but also for other analogous derivatives $(\eta^5\text{-C}_5\text{H}_4\text{R})_3\text{UCl}$. From the contact term, the hyperfine coupling constants can be calculated and a good order of magnitude of the unpaired spin density delocalised on the ligand is obtained. This result leads the authors to propose a mechanism of spin delocalisation by polarisation of the electrons of the ligand and to assign to these a high covalency at the π bonds. (18 refs.)

77276 ^{23}Na Knight shift of liquid Na-Sn alloys. C.van der Marel, P.C.Stein, W.van der Lugt (Solid State Phys. Lab., Univ. of Groningen, Groningen, Netherlands).

Phys. Lett. A (Netherlands), vol.95A, no.8, p.451-3 (23 May 1983). Measurements of the ^{23}Na Knight shift in liquid Na-Sn alloys provide strong indications for the formation of compounds about the two distinct compositions Na_2Sn and Na_4Sn_3 . (10 refs.)

76.60E Relaxation effects

77277 Nuclear magnetic resonance study of atomic motions in vanadium. B.Gunther, O.Kanert (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany). *Acta Metall. (USA)*, vol.31, no.6, p.909-17 (June 1983).

Atomic motions in solid vanadium have been investigated by means of NMR. For that purpose, the Zeeman spin-lattice relaxation time T_1 , the rotating-frame spin-lattice relaxation time $T_{1\rho}$, and the Knight shift K of ^{51}V in polycrystalline vanadium have been measured as a function of temperature in the range between 300 and 2000K. At all temperatures, the relaxation time T_1 is mainly determined by electronic contributions leading to a temperature-dependent expression for the Korringa relation T_1TK^2 . In contrast to the T_1 -data, two pronounced peaks in the relaxation rate $T_{1\rho}^{-1}$ at about 750 and 1600K, respectively, are observed. The peak at 750K arises from fluctuations in the nuclear quadrupolar interaction between vanadium and interstitially migrating oxygen whereas the maximum at 1600K is caused by fluctuations in the nuclear dipole interaction due to atomic self-diffusion. From the low-temperature data, the diffusivity of oxygen is determined to be $D_0 = 3.2 \times 10^{-6} \exp(-0.73 \text{ eV}/kT) \text{ cm}^2/\text{s}$. By comparing the self-diffusion contribution to the relaxation rate with the tracer measurements of Pelleg, the correlation factor f was found to be $f = 0.77 \pm 0.11$ consistent with a monovacancy diffusion mechanism. The uncorrelated self-diffusion coefficient was obtained as $D_{SD} = 0.14 \exp(-3.09 \text{ eV}/kT) \text{ cm}^2/\text{s}$. (30 refs.)

77278 Barriers to rotation of the cyclopentadienyl ligand: spin-lattice relaxation time measurements and atom-atom potential calculations on cyclopentadienyl manganese and rhenium tricarbonyl and vanadium tetracarbonyl complexes. D.F.R.Gilson, G.Gomez, I.S.Butler, P.J.Fitzpatrick (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).

Can. J. Chem. (Canada), vol.61, no.4, p.737-42 (April 1983). The barriers to cyclopentadienyl ring rotation in the solid phase have been measured by spin-lattice relaxation time methods for the organometallic complexes $\text{CpMn}(\text{CO})_3$ (7.24 kJ mol $^{-1}$), $\text{CpRe}(\text{CO})_3$ (7.15 kJ mol $^{-1}$), and $\text{CpV}(\text{CO})_4$ (7.07 kJ mol $^{-1}$), where $\text{Cp} = \eta^5\text{-C}_5\text{H}_5$. Nonbonded atom-atom potential calculations of the barriers in these complexes and in $\text{BzCr}(\text{CO})_3$ ($\text{Bz} = \eta^5\text{-C}_6\text{H}_5$) show that the molecular conformation of the Mn and Re compounds is determined by crystal packing forces and that concerted ring motions are possible for the cyclopentadienyl complexes, but not for the benzene chromium tricarbonyl. (33 refs.)

77279 The measurements of NMR T_1 and NOE. Wang Jinshan, Xie Dilin (Dept. of Radio Electronics, Beijing Normal Univ., Beijing, China), Chen Liang, Hu Yuxian.

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.2, p.209-12 (Feb. 1983). In recent years, using of the pulse Fourier transform NMR spectrometer for measuring the nuclear magnetic resonance spin-lattice relaxation time (T_1) has become an important method for the analyses of molecular constructions and the study of molecular dynamics. The authors discuss some problems concerning the techniques for measuring the spin-lattice relaxation time (T_1) and the nuclear Overhauser enhancement factor (NOE) of ^{13}C nuclei, and a few ways of eliminating errors. (4 refs.)

77280 ^{77}Se nuclear magnetic resonance in di-tetramethyltetraselenafulvalene phosphorous hexafluoride $[(\text{TMTSF})_2\text{PF}_6]$ under pressure. L.J.Azevedo, J.E.Schirber (Sandia Nat. Labs., Albuquerque, NM, USA), E.M.Engler.

Phys. Rev. B (USA), vol.27, no.9, p.5842-5 (1 May 1983). The authors report measurements of the Knight shift, spin-lattice relaxation time, linewidth, and absolute susceptibility of ^{77}Se as functions of pressure, field, and temperature in the organic superconductor tetramethyltetraselenafulvalene phosphorous hexafluoride $[(\text{TMTSF})_2\text{PF}_6]$. The results indicate that there is significant p -wave spin density at the Se sites and that the quenching of the spin-density wave (SDW) is a slow function of pressure. That is, there is a significant pressure regime where there is coexistence of a metallic and SDW state. The nature of this coexistence is discussed. (14 refs.)

77281 Nuclear spin-lattice relaxation in doped silicon under optical pumping conditions. N.T.Bagraev, L.S.Vlasenko, I.A.Merkulov (A.F. Ioffe Physico-Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1972-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3467-70 (Nov. 1982) [received: May 1983]

The authors have investigated the spin-lattice relaxation of ^{29}Si nuclei in silicon subjected to a wide range of magnetic fields and containing donor hydrogen-like centers with different ionization energies. The spin-lattice relaxation of ^{29}Si nuclei in silicon is due to their hyperfine interaction with paramagnetic centers. This hyperfine interaction is most effective for the nearest neighbour ^{29}Si nuclei because its intensity decreases on increase in the distance r from the paramagnetic center. The appearance of a steady state nuclear polarization throughout a crystal is due to a nuclear spin diffusion processes. (9 refs.)

76.60G Quadrupole resonance

77282 Nuclear-quadrupole-resonance study of the ground state of praseodymium in lanthanum trifluoride. R.R.Reddy, L.E.Erickson (Nat. Res. Council, Ottawa, Ontario, Canada).

Phys. Rev. B (USA), vol.27, no.9, p.5217-23 (1 May 1983).

A nuclear-quadrupole-resonance study of trivalent praseodymium in a lanthanum trifluoride single crystal is presented. The magnitudes and orientation of the enhanced nuclear Zeeman tensor are obtained for the six magnetically inequivalent sites from measurements in 100-G magnetic fields. By comparing the directions of the site y axis and the crystal a axis, it is concluded that the Pr^{3+} site symmetry is C_2 and not C_{3v} . From a study of the polarization of the optical pump transition for each Pr^{3+} site, it is determined that the $^3\text{H}_4(0 \text{ cm}^{-1}) \rightarrow ^1\text{D}_2(16872 \text{ cm}^{-1})$ optical transition is an electric dipole transition. (29 refs.)

77283 ^{17}O nuclear-quadrupole-resonance measurements in the ferroelectric phase of potassium dihydrogen phosphate: Evidence for proton tunneling. S.D.Goren (Dept. of Phys., Ben Gurion Univ., Beer Sheva, Israel), M.Shporer, Y.Margalit.

Phys. Rev. B (USA), vol.27, no.9, p.5419-23 (1 May 1983). The pure nuclear-quadrupole-resonance spectra of naturally abundant ^{17}O in potassium dihydrogen phosphate (KDP) in the ferroelectric phase was obtained by a double-resonance-sensitive detection method. Fine structure due to dipolar interaction with the protons was resolved. From the best fit between the calculated and experimental spectra it is deduced that proton motion along the hydrogen bond prevails in the ferroelectric phase. The ordering parameter for the proton along the hydrogen bond is estimated. (8 refs.)

76.60L Spin echoes

77284 Specific heat and NMR spin echo in the superconducting and magnetic region of the Y_2Co_3 compound. A.Lewicki, Z.Tarnawski, Cz.Kapusta, A.Kolodziejczyk, H.Figiel, J.Chmst (Solid State Phys. Dept., Univ. of Mining & Metall., Cracow, Poland), Z.Lalowicz, L.Sniadower.

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.297-302 (April 1983). The specific heat and NMR of the magnetic superconductor Y_2Co_3 and other compounds close to this phase were measured. The electronic contribution to the specific heat is mainly caused by Co electrons by the phonon contribution is mainly due to the Y lattice. The coexistence of magnetism and superconductivity was observed through changes of the Knight shift parameter of the NMR spectrum. The most striking result is that the authors found a negative Knight shift for some parts of the h-type Co atoms which might mean that superconductivity originates also from these atoms and not only from the Y band. (22 refs.)

77285 NMR and magnetization study of the mixed systems $(\text{Pd}_{1-x}\text{Cu}_x)_2\text{MnIn}$ and $(\text{Pd}_{1-x}\text{Ni}_x)_2\text{MnIn}$. J.Schaf, I.A.Campbell (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), K.Le Dang, P.Veillet, A.Hamzik.

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.310-18 (April 1983). Systematic NMR and magnetization data with concentration show that for decreasing x these systems go from ferromagnetic (F) to antiferromagnetic (AF) order by passing through a mixed phase region where both magnetic orders coexist in different domains. The magnetic phase diagrams for both alloy series are nearly coincident. The NMR spectra show that the Cu or Ni atoms substitute randomly onto Pd sites and the authors find no evidence that the participation of Mn atoms in F or AF domains is at all correlated with their nearest neighbour environments. In the limit where the AF order becomes largely dominant the samples exhibit a magnetic anisotropy after field cooling. (27 refs.)

77286 Temperature dependences of the sublattice magnetizations in nickel ferrite. A.V.Kunevich, G.D.Pavlov, V.V.Filipov.

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1998-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3506-8 (Nov. 1982) [received: May 1983]

The authors used the NMR spin echo method to study hyperfine fields at ^{57}Fe and ^{61}Ni nuclei in polycrystalline nickel ferrite $\text{Fe}^{3+}[\text{Ni}^{2+}\text{Fe}^{3+}]_2\text{O}_4$.

with the inverted spinel structure at temperatures $4.2=810\text{K}$ so as to determine the temperature dependences of the nickel and iron sublattice magnetizations, and then calculate the exchange interaction parameters. (7 refs.)

76.70 MAGNETIC DOUBLE RESONANCES AND CROSS EFFECTS

76.70D Electron-nuclear double resonance (ENDOR)

77287 Electron nuclear double resonance of ¹³C nuclei with natural abundance in trissarcosine calcium chloride doped with Mn²⁺ ions. H.Metz, J.Kuchler, R.Bottcher, W.Windsch (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).

Chem. Phys. Lett. (Netherlands), vol.97, no.3, p.303-7 (20 May 1983). ¹³C ENDOR measurements were performed at 4.2K on single crystals of trissarcosine calcium chloride doped with Mn²⁺ ions. Hyperfine coupling tensors were measured for six ¹³C nuclei of the carboxyl groups. An attempt is made to interpret the data in terms of electron-transfer and dipole-dipole contributions. (14 refs.)

76.70E Dynamical nuclear polarization

77288 Optical polarization of lattice nuclei in strongly deformed silicon. N.T.Bagraev, L.S.Vlasenko (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1974-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3470-2 (Nov. 1982). [received: May 1983]

The authors have investigated processes of optical polarization of nuclei in silicon having a high density of dislocations created by plastic deformation. The strain ϵ created by such deformation in n-type silicon single crystals grown by the floating zone method and containing 10^{13}cm^{-3} of phosphorus was $\epsilon=5\%$, 30% , and $50\text{-}70\%$. Electron localization on defects and optical nuclear polarization in disordered and semimagnetic semiconductorsSee Entry 77270

76.70F Double nuclear magnetic resonance (DNMR)

77289 Frequency spectrum of a double nuclear magnetic γ resonance in Ta¹⁸¹. V.K.Voitovetskii, S.M.Chermisin, A.Yu.Dudkin, E.G.Ploskirev (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

JETP Lett. (USA), vol.36, no.9, p.393-7 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.322-5 (5 Nov. 1982). [received: June 1983]

The frequency spectrum of the double nuclear magnetic γ resonance in the excited state of the source nuclei, Ta^{181*}, has been measured. The results are compared with calculations. (7 refs.)

77290 Pulsed double nuclear magnetic resonance in a CaF₂:La³⁺:Na⁺ crystal. D.I.Vainshtein, V.D.Shechepkin, V.A.Safin, V.M.Vinokurov (V.I. Ulyanov-Lenin State Univ., Kazan, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1981-2 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3480-3 (Nov. 1982). [received: May 1983]

At 77K the authors applied the DNR method to a CaF₂:La³⁺:Na⁺ crystal grown with an admixture of up to $\sim 0.3\%$ of the appropriate fluoride to the initial charge. The spin-lattice and dipole relaxation times obtained in a magnetic field of the H₀[110] orientation were found to be T₁=28.2 sec and T_{2d}=3.01 sec, respectively. The large difference between the spin-lattice and dipole relaxation times made it possible to record the DNR spectra without recourse to phase detection. (7 refs.)

76.70H Optical double magnetic resonance (ODMR)

77291 Measurement of the hyperfine structure of Pr³⁺:YAG by quantum-beat free-induction decay, hole burning, and optically detected nuclear quadrupole resonance. R.M.Shelby, A.C.Tropper, R.T.Harley, R.M.Macfarlane (IBM Res. Lab., San Jose, CA, USA).

Opt. Lett. (USA), vol.8, no.6, p.304-6 (June 1983). The hyperfine splitting of the ground state and the lowest electronic component of the ¹D₂ excited state have been measured for Pr³⁺ in YAG. The authors show that a particularly simple and powerful technique is the production of sublevel coherence by short-pulse (impact) excitation, which is detected by coherent forward scattering of a weak probe beam and Fourier transformation of the resulting quantum-beat signal. This yielded excited-state splittings of 6.49 and 8.29 MHz. The ground state shows large pseudoquadrupole splittings of 33.4 and 41.6 MHz, which were obtained by optically detected nuclear quadrupole resonance. (14 refs.)

77292 ODMR investigation of recombination processes in a-Si_{1-x}C_x:H. S.P.Depinna, B.C.Cavenett (Dept. of Phys., Univ. of Hull, Hull, England), R.Sussmann.

Philos. Mag. B (GB), vol.47, no.5, p.L51-5 (May 1983). An investigation of glow-discharge deposited films of a-Si_{1-x}C_x:H by optically detected magnetic resonance (ODMR) has shown for the first time in group-IV materials a half-field ($g=4.017$) resonance as well as a signal at $g=2.0030$. These quenching signals have been observed for films having low carbon-content ($x>30\%$) and were associated with all but the highest energy emission. Although Fe impurities cannot be ruled out, the ODMR results are consistent with a triplet non-radiative path which competes with highly localized radiative recombination. (16 refs.)

77293 ODMR investigation of recombination in $\mu\text{-Si:H}$. S.P.Depinna, K.Homeewood, B.C.Cavenett (Dept. of Phys., Univ. of Hull, Hull, England), I.G.Austin, T.M.Searle, G.Willeke, S.Kinmond.

Philos. Mag. B (GB), vol.47, no.5, p.L57-62 (May 1983). The luminescence from $\mu\text{-Si:H}$ measured out to 0.54 eV shows a long low-energy tail with a broad maximum near 0.8 eV as well as bands at 0.95 and 1.3 eV. The ODMR shows that the long tail is associated with two enhancing signals with $g=1.999$ and 2.006 implying donor-acceptor recombination in the microcrystallites. A weak quenching ODMR signal at $g=2.005$ is associated with the 1.3 and 0.95 eV emission bands and, in particular, the results for the 1.3 eV band are consistent with it arising in the amorphous intercrystallite

region. The 0.95 eV band is thought to arise from defects similar to those observed in crystalline material. (13 refs.)

77294 Optical detection of cross relaxation between rare-earth ions in lanthanum trichloride crystals. R.Furrer, C.A.Hutchison, Jr. (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5270-8 (1 May 1983). The dynamics of relaxation and interionic energy-transfer processes for Nd³⁺ and Er³⁺ ions, dilutely cosubstituted at La³⁺ sites in LaCl₃ single crystals, have been investigated in a series of optical-magnetic double-resonance experiments. These processes have been studied by measuring the effects of electron-paramagnetic-resonance absorption at microwave frequencies on the fluorescence radiation emitted during continuous Ar-ion-laser irradiation. In cases for which the ratio of the magnetic field energy splitting of the ground Kramers doublet of Er³⁺ to that of Nd³⁺ had values relatively close to 1/2, 1/3, 1/4, or 1/5, the time for regaining steady-state-level populations after termination of microwave irradiation was markedly reduced compared with other ratios and was minimum at those particular values. This observation is interpreted as due to energy-conserving cross-relaxation processes involving several Nd³⁺ and Er³⁺ ions simultaneously. (30 refs.)

Nuclear-quadrupole-resonance study of the ground state of praseodymium in lanthanum trifluorideSee Entry 77282

76.80 MÖSSBAUER EFFECT; OTHER GAMMA-RAY SPECTROSCOPY

77295 Elastic and inelastic scattering of gamma rays from V₃Si. S.S.Ti, T.R.Finlayson, T.F.Smith, J.D.Cashion, P.E.Clark (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia).

Aust. J. Phys. (Australia), vol.36, no.2, p.185-96 (1983). The elastic and inelastic components of γ -ray scattering from a non-transforming V₃Si single crystal have been measured using a ⁵⁷Co Mossbauer source and resonant absorber. The system places an upper limit of $\pm 4 \times 10^{-8}$ eV on the possible energy transfer which distinguishes inelastic from elastic scattering. The scattering of the (440) Bragg reflection with $q=0$ and $q\sim 0.1\text{ \AA}^{-1}$ has been measured as a function of temperature for two orthogonal orientations of the crystal. Anomalous changes in the inelastic intensities have been observed. It is suggested that these changes are associated respectively with central mode and soft mode aspects of the dynamics of the vanadium atoms. (21 refs.)

77296 Mossbauer spectroscopy of amorphous silicon-tin-hydrogen alloys. D.L.Williamson, S.K.Deb (Solar Energy Res. Inst., Golden, CO, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2588-92 (May 1983). Amorphous-Si_{1-x}Sn_x:H alloys have been prepared by DC and RF sputtering of composite Si-Sn targets in Ar-H₂ gas mixtures. ¹¹⁹Sn conversion electron Mossbauer spectroscopy and X-ray diffraction reveal the Sn to be incorporated into the films in at least four distinct sites, the relative populations of which depend strongly on preparation conditions. The Mossbauer resonance from the substitutional Sn in the α -Si:H matrix is well characterized by a quadrupole splitting of $0.46\pm 0.05\text{ mm/s}$ independent of x and preparation conditions. Experimental procedures have been found such that samples can be produced which contain only the substitutional Sn site. (14 refs.)

77297 Giant hyperfine field on ¹⁵¹Eu in EuFe₂P₁₂ [Mossbauer study]. A.Gerard, F.Grandjean (Inst. de Phys., Univ. de Liege, Sart-Tilman, Belgium), J.A.Hodges, D.J.Braun, W.Jeitschko.

J. Phys. C (GB), vol.16, no.14, p.2797-801 (20 May 1983). Unusual ¹⁵¹Eu²⁺ hyperfine parameters are observed in EuFe₂P₁₂. The low-temperature saturated hyperfine field ($H= -670\text{ kOe}$) is particularly large and the isomer shift of -6.0 mm s^{-1} (relative to EuF₃) is evidence of a particularly high nuclear s-electron density. In addition, the ferromagnetic ordering temperature is very high (100K) especially in view of the large distance (6.8 Å) between the Eu²⁺ ions and the fact that Fe has no localised magnetic moment. The anomalously high hyperfine field points to the importance of f-d band coupling. (10 refs.)

77298 Evidence for electronic exchange between Fe²⁺ and Fe³⁺ in rhombohedral oxides AFe₂O₄ using ⁵⁷Fe Mossbauer spectroscopy. R.Gerardin, O.Evrard (Lab. de Chimie du Solide Mineral, Univ. de Nancy I, Vandoeuvre les Nancy, France).

J. Phys. & Chem. Solids (GB), vol.44, no.5, p.423-9 (1983). In French. The ABB₂O₄ rhombohedral oxides containing exclusively either Fe²⁺(InFeGe_{0.5}Zn_{0.5}O₄) or Fe³⁺(LuMgFeO₄ and LuMnFeO₄) are investigated with Mossbauer spectroscopy, in their paramagnetic state. A similar study is made on two mixed oxides containing iron under its two oxidation states with the Fe²⁺/Fe³⁺=2 and 1 (InFe_{1.5}Ga_{0.5}O₄ and InFe₂O₄) atomic ratio. Comparing the results, the authors conclude that a fast electronic exchange between Fe²⁺ and Fe³⁺ takes place at room temperature. In this structure, point Fe²⁺ and Fe³⁺ are distributed on the same crystallographic site with the point symmetry C_{3v}. They show that neighbouring effects lower this local symmetry. (14 refs.)

77299 Effect of an electric field on the Mossbauer spectra of the ferrites BaFe₁₂O₁₉. E.G.Rozin, M.N.Shipko, I.S.Zheludev (Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.9, p.385-7 (5 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.9, p.316-18 (5 Nov. 1982). [received: June 1983] Mossbauer studies of single crystals of hexagonal ferrite BaFe₁₂O₁₉ in an external electric field are performed. An appreciable decrease of the local magnetic field at Fe⁵⁷ nuclei situated in two crystallographic positions: trigonal bipyramid and octahedron, was observed in an electric field for the first time. (7 refs.)

77300 Lattice temperature and hyperfine interactions of Pb_{1-x}Sn_xTe (0.21 $\leq x\leq 0.75$). R.H.Herber (Dept. of Chem., Rutgers State Univ., New Brunswick, NJ, USA), R.Kalish.

J. Solid State Chem. (USA), vol.47, no.3, p.284-92 (May 1983). Thin ($<15\text{ }\mu\text{m}$) samples of lead tin telluride, Pb_{1-x}Sn_xTe ($x=0.21, 0.25, 0.55, \text{ and } 0.75$) have been studied by temperature dependent Mossbauer spectroscopy using the 23.8 keV gamma radiation of ^{119m}Sn. The tin atom occupies a lattice site having cubic symmetry ($Q_S=0\pm 0.020\text{ mm sec}^{-1}$) over the temperature range $78\leq T\leq 240\text{K}$, and there is no evidence for a rhombic (low temperature) to cubic (high temperature) phase transition such as that reported for SnTe in this temperature interval. The lattice temperature as probed by the Sn atom is independent of the compositional parameter x and is similar to that reported for SnTe from Mossbauer studies and for Pb_{0.6}Sn_{0.37}Te from X-ray powder diffraction data. Radiation damage produced by 2-MeV proton irradiation to a total fluence of $\sim 10^{17}\text{ cm}^{-2}$ at liquid nitrogen temperature does not have any effect on the Mossbauer

parameters, possibly because the major damage is annealed at temperatures below 150K. (30 refs.)

77301 ⁵⁷Fe Mossbauer study of amorphous $\text{Fe}_{81}\text{B}_{13.5}\text{Si}_{3.5}\text{C}_2$. R.E.Vandenberghe, D.Gryffroy (Lab. of Magnetism, Univ. of Gent, Gent, Belgium). *J. Magn. & Magn. Mater. (Netherlands)*, vol.36, no.3, p.259-64 (April 1983). The amorphous ferromagnet $\text{Fe}_{81}\text{B}_{13.5}\text{Si}_{3.5}\text{C}_2$ (Metglas 2605SC) has been investigated with Mossbauer spectroscopy. The hyperfine interaction parameters are studied between 80 and 300K from which some characteristic properties are deduced. The behaviour of the amorphous alloy at higher temperatures has been studied by the room temperature spectra of annealed samples. After a structural relaxation process, a two step crystallization transformation is observed leading to Fe-Si alloy and $\text{Fe}_2(\text{B}, \text{C})$. X-ray diffraction of samples annealed at higher temperatures reveals the presence of an orthorhombic Fe-B-Si phase: this structure changes slightly with annealing temperature. (18 refs.)

77302 The hyperfine interaction of gadolinium and holmium in cubic Ho(Gd, Ce) Fe_2 compounds. O.Prakash, M.A.Chaudhry, J.W.Ross, M.A.H.McCausland (Schuster Lab., Univ. of Manchester, Manchester, England).

J. Magn. & Magn. Mater. (Netherlands), vol.36, no.3, p.271-6 (April 1983). The low-temperature hyperfine parameters of the ferrimagnetic C15 intermetallic system $\text{Ho}_{0.93}\text{Ce}_{0.07}\text{Fe}_2$ have been measured at Gd using the 87 γ -ray of ^{155}Gd and at Ho using spin echo NMR of ^{165}Ho . A linear decrease of the hyperfine field B_h with increasing x is observed, the slope being almost the same for both nuclei. The observed slope ($dB_h/dx \approx -37$ T) is nearly three times greater than that found for ^{155}Gd in the analogous $\text{Ho}(\text{Y}, \text{Gd})\text{Fe}_2$ system; this is attributed to the influence of the increased conduction electron density when trivalent lanthanide ions are replaced by Ce^{4+} . (28 refs.)

77303 Magnetic hyperfine splitting in Mossbauer spectra of microcrystals. S.Morup (Lab. of Appl. Phys. II, Tech. Univ. of Denmark, Lyngby, Denmark).

J. Magn. & Magn. Mater. (Netherlands), vol.37, no.1, p.39-50 (May 1983). Below the superparamagnetic blocking temperature of a microcrystal the magnetization direction is in general not fixed, but fluctuates in directions close to an easy direction of magnetization. Such fluctuations (collective magnetic excitations) result in a reduction in the magnetic splitting of the Mossbauer spectrum. A low-temperature approximation for this reduction is derived for microcrystals with arbitrary magnetic energy. Moreover, explicit expressions are presented for particles with special types of magnetic anisotropy and for particles exposed to external magnetic fields. The reduction in the magnetic hyperfine field has its maximum value just below the blocking temperature but does not exceed 5-15% in isolated particles with uniaxial anisotropy in zero applied magnetic field. However, ferro- and ferrimagnetic particles, exposed to external magnetic fields, and particles for which exchange anisotropy is predominant, may exhibit any magnetic hyperfine splitting between zero and the saturation value. It is shown that in special cases an assembly of microcrystals in close contact with each other may behave like a spin-glass. The author discusses how studies of the magnetic hyperfine splitting of Mossbauer spectra of microcrystals give information on the particle size and the prevailing magnetic anisotropies. (47 refs.)

77304 Phase analysis of the oxidation products of plain steels by Mossbauer spectroscopy. O.Dolezel (Ustav Pro Vyzkum Rud, Praha, Czechoslovakia), M.Seberini, M.Vadura, K.Volenik.

Kovove Mater. (Czechoslovakia), vol.21, no.2, p.142-57 (1983). In Czech. The oxide layers produced by high-temperature oxidation of plain steels and separated by the dissolution of steel substrate in an iodine-methanol solution were studied by Mossbauer transmission spectroscopy. The Mossbauer spectra were fitted by an approximative method using a Newlett-Packard calculator and assuming Lorentzian shape of spectral lines. The areas of partial spectra of individual phases were determined. The quantitative phase analysis of the specimens representing binary systems magnetite-hematite and wustite-magnetite was based on calibration curves obtained from the Mossbauer spectra of standard mixtures of synthetic oxides. The same calibration curves were used in the analysis of the ternary system wustite-magnetite-hematite. With the phase analysis results it was possible to calculate the concentration of bivalent iron versus total iron and to compare it with the value determined chemically. This was possible if a sufficient quantity of oxidation products was available, i.e. for thick oxide layers containing wustite. The results show that the systematic errors of phase analysis are considerably smaller than the random ones; the latter can be as large as several per cent. (19 refs.)

77305 A method for fitting complex Mossbauer spectra. Gauss-Newton method with modified factors. Cai Ruiying (Nanjing Inst. of Chem. Technol., China).

Kexue Tongbao (Foreign Lang. Ed.) (China), vol.28, no.3, p.416-22 (March 1983).

Mossbauer spectroscopy is one of the important modern methods for microstructural analysis of substances. For accurate determination of the Mossbauer spectral parameters, namely, the position, intensity, and width of each absorption peak of the spectrum, careful choice of numerical methods and design of applicable computer program for fitting by computer are very important. At present, the most common method used for fitting Mossbauer spectra is the Gauss-Newton method. It is suitable for the simple and good splitting spectrum. But it fails to fit for the slightly split and poorly resolved complex spectrum. In order to overcome these difficulties, a method devised with applicable computer program for fitting complex Mossbauer spectra is introduced and its application illustrated with examples. (4 refs.)

77306 Magnetic order in isoelectronic Co(GaVFe) alloys. G.L.Whittle (Dept. of Solid State Phys., Australian Nat. Univ., Canberra, Australia).

Phys. Status Solidi A (Germany), vol.76, no.1, p.351-6 (16 March 1983). A series of isoelectronic Co-Ga based alloys with V and Fe substituted for Ga is studied by Mossbauer spectroscopy (4.2 to 210K). The alloys are found to have similar bulk magnetic properties, as predicted, despite the wide concentration variation and different microscopic magnetic behaviour. The electron per atom ratio is established to be the controlling parameter for the onset of low temperature ferromagnetism. The data are also consistent with the presence of L_2 order at high V concentrations. (9 refs.)

77307 A Mossbauer study of octahedral site symmetries in systems $\text{Co}_x\text{Mn}_{3-x}\text{Fe}_2\text{O}_4$ and $\text{Ni}_x\text{Mn}_{3-x}\text{Fe}_2\text{O}_4$. V.K.Singh, S.Lokanathan (Dept. of Phys., Univ. of Rajasthan, Jaipur, India).

Pramana (India), vol.20, no.1, p.1-5 (Jan. 1983). [received: May 1983] A Mossbauer study of cation distribution in systems $\text{Co}_x\text{Mn}_{3-x}\text{Fe}_2\text{O}_4$ and $\text{Ni}_x\text{Mn}_{3-x}\text{Fe}_2\text{O}_4$ has been made. It has been found that in both systems all specimens with $y < 0.6$ value exhibit quadrupole doublets corresponding to site symmetries $\text{Fe}^{3+}(\text{I})$ and $\text{Fe}^{3+}(\text{II})$ of octahedral site. As more and more cobalt or nickel is introduced into the matrix the intensity of the inner quadrupole doublet increases while on introducing iron that of the outer quadrupole doublet increases. After a certain concentration of iron the inner doublet starts becoming more intense. It is suggested that this arises possibly from the substitution of cations in the second co-ordination sphere of $\text{Fe}^{3+}(\text{I})$ and

$\text{Fe}^{3+}(\text{II})$ sites. For $y > 0.6$ the Mossbauer spectra show relaxation effects. (11 refs.)

77308 Cation distribution of the system $\text{Zn}_{1-x}\text{Co}_x\text{FeMnO}_4$ by X-ray, electrical conductivity and Mossbauer studies. P.A.Jain, V.S.Dashane (Chem. Dept., Inst. of Sci., Bombay, India).

Pramana (India), vol.20, no.1, p.7-17 (Jan. 1983). [received: May 1983] Structural, electrical and Mossbauer studies were carried out for the system $\text{Zn}_{1-x}\text{Co}_x\text{FeMnO}_4$. It is observed that for $x \leq 0.6$, the ionic configuration of the system is $\text{Zn}_{1-x}^{2+}\text{Mn}_x^{2+}[\text{Co}_x^{3+}\text{Mn}_{1-x}^{3+}\text{Fe}^{3+}]_2\text{O}_4$ and for $x \geq 0.8$ Fe^{3+} ions occupy tetrahedral site also. On the basis of electrical and Mossbauer studies a probable valence distribution of CoMnFeO_4 has been suggested. All the compounds showed positive values of thermoelectric coefficient and electrical conduction takes place by a hopping mechanism. Activation energy and thermoelectric coefficient values decreased with decrease in concentration of Zn^{2+} ions. The compounds possess low mobility values varying between 10^{-10} and 10^{-9} $\text{cm}^2/\text{V sec}$. (30 refs.)

77309 Influence of isomer-shift distribution on Mossbauer quadrupole spectra in amorphous magnetic insulators. M.E.Lines, M.Eibschutz (Bell Labs., Murray Hill, NJ, USA).

Phys. Rev. B (USA), vol.27, no.9, p.5308-12 (1 May 1983). A mechanism is proposed whereby any distribution of isomer shifts in an amorphous material containing Fe^{3+} will broaden the ^{57}Fe paramagnetic Mossbauer doublet lines. The known variance of isomer shift in amorphous $\text{Y}_2\text{Fe}_2\text{O}_7$ is shown to be quite sufficient to account for the observed broadening in this material from that expected for quadrupole energy distribution in a random packed structure. (10 refs.)

77310 Site distribution in heavily Sc^{3+} , Zr^{4+} , and Hf^{4+} -substituted yttrium iron garnet. G.Balestrino (Istituto di Elettronica dello Stato Solido, Consiglio Nazionale delle Ricerche, Roma, Italy), S.Geller.

Phys. Rev. B (USA), vol.27, no.9, p.5807-9 (1 May 1983). Mossbauer spectra of yttrium iron garnet containing large amounts of Sc^{3+} , Zr^{4+} , and Hf^{4+} substituted for Fe^{3+} ions (the last two with electrostatic compensation by Ca^{2+} ions) confirm the conclusions deduced from O-K spontaneous magnetization that the Zr^{4+} and Hf^{4+} ions prefer octahedral sites exclusively. Very small amounts of Sc^{3+} ions enter tetrahedral sites: For a total of one Sc^{3+} ion per formula unit, 0.03 is tetrahedral; for a total of 1.5 Sc^{3+} ions per formula unit, 0.09 is tetrahedral. These results imply that in the region of the ferrimagnetic ground state, i.e., to 0.72 Sc^{3+} ion per formula unit, at most 0.02 is tetrahedral, but it could be that there is none because of the coincidence of the O-K dependence of the spontaneous magnetization on the composition of the Zr^{4+} - and Sc^{3+} -substituted yttrium iron garnets in that region. Thus the model given by Geller et al. for the magnetic behavior of substituted iron garnets is corroborated by these results. (10 refs.)

77311 Mossbauer study of iron hydride formation by low temperature ion implantation. F.Schreyer, G.Frech, G.K.Wolf (Inst. fur Phys. Chem., Univ. Heidelberg, Heidelberg, Germany), F.E.Wagner.

Solid State Commun. (USA), vol.46, no.8, p.647-50 (May 1983). High doses of 18 and 24 keV H_2^+ ions were implanted into α -iron films at liquid nitrogen temperature. Mossbauer spectra reveal the formation of a new phase with a hyperfine field of 30.4 T, a small quadrupole splitting and an isomer shift in the direction of lower electron density at the Fe nuclei. On the basis of its Mossbauer parameters and decomposition behaviour, this component can be identified as the recently described ϵ -phase iron hydride. A comparison with the effects of the low temperature implantation of He^+ ions supports this assignment. (19 refs.)

77312 ^{57}Fe Mossbauer spectroscopy on FePt Invar alloys. J.Hesse, G.Nolle, H.Korner (Inst. fur Metallphys. & Nukleare Festkorperphys., Tech. Univ. Braunschweig, Braunschweig, Germany).

Solid State Commun. (USA), vol.46, no.9, p.721-5 (June 1983). From ^{57}Fe Mossbauer effect investigations on disordered FePt-Invar alloys the authors determined the concentration dependence of both the mean isomer shift and the mean magnetic hyperfine field. Evaluating these changes in terms of charge and spin densities at the nuclei and combining the results with X-ray investigations they find the electronic state of the iron atoms being $3d^4s^1$ in these alloys. They present a 'magnetic' phase diagram and discuss the influence of the martensitic transformation. (18 refs.)

77313 Study of Ti_3Al with a ^{57}Fe impurity by the nuclear gamma resonance method. I.A.Zelenkov, S.N.Pastushenko (Kiev Inst. of Civil Aviation Engrns., Kiev, Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.813-16 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.70-4 (Oct. 1982). [received: May 1983]

A study was made of the ultrafine structure of the Mossbauer nuclear gamma resonance (NGR) absorption spectra of powdered specimens of a $(\text{TiFe})_{50}\text{Al}_{50}$ alloy with the Mg_2Cd order. The spectra were found to contain singlet and doublet components corresponding to the positions of Mossbauer iron atoms in the aluminum and titanium sublattices of Ti_3Al . Deformation of the Ti_3Al alloy after prolonged annealing brought about a substantial broadening of Mossbauer absorption lines. The presence of Al atoms in the near vicinity of the resonant ^{57}Fe atoms led to the filling of the 3d states of the iron atoms through a redistribution of electrons from the nearest aluminum atoms. The nature was determined of the electric field gradients forming on the ^{57}Fe nuclei located on the titanium points of the crystal lattice of ordered Ti_3Al . At lower temperatures the impurity iron atoms in ordered Ti_3Al occupied mainly the aluminum points. (14 refs.)

77314 The isomeric shift anomaly near phase transition temperature. B.Ya.Sukharevskii, V.G.Ksenofontov, A.N.Ulyanov, I.V.Vilkova.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.720-2 (May 1983). In Russian. The temperature dependence has been studied for the isomeric shift of the ^{119}Sn Mossbauer resonance line in $\text{CuSnF}_6 \cdot 6\text{H}_2\text{O}$. The isomeric shift is shown to change in a nonmonotonic manner within the temperature range preceding dehydration. (9 refs.)

76.90 OTHER TOPICS IN MAGNETIC RESONANCES AND RELAXATION
(inc. muon probe studies)

77315 Muon-spin-rotation experiments in orthoferrites. E.Holzschuh, A.B.Denison, W.Kundig, P.F.Meier, B.D.Patterson (Phys.-Inst., Univ. Zurich, Zurich, Switzerland). *Phys. Rev. B (USA)*, vol.27, no.9, p.5294-307 (1 May 1983).
A systematic study of the behavior of positive muons in orthoferrites RFeO₃ has been performed. Measurements as a function of temperature and applied magnetic field have been made for R=Sm, Eu, Dy, Ho, Y, and Er. Typically several different sites are occupied by the muons at low temperatures, and transitions occur to one stable site with temperature-dependent rate constants. By comparing the measured internal magnetic fields with calculated dipole fields of the iron ions, the position of the stable muon site was found to be on the mirror plane *m* about 1 Å from the nearest oxygen ion, implying the formation of the hydroxyl analog (OH⁻). Muon diffusion was observed for R=Sm with about 10 jumps/ μ s at 296K. (38 refs.)

77.00 DIELECTRIC PROPERTIES AND MATERIALS
(for conductivity phenomena, see 72.20 and 72.80)

77.20 PERMITTIVITY

77316 Strain dependence of the low-frequency dielectric constants of a few alkali halides. G.Balakrishnan, K.Srinivasan, R.Srinivasan (Dept. of Phys., Indian Inst. of Technol., Madras, India). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2875-7 (May 1983).
The variation of the low-frequency dielectric constant of NaCl, KCl, and KBr with stress has been determined by subjecting the crystals to uniaxial compressive stresses. Contrary to expectations, the dielectric constant was found to increase on stressing. On *n* irradiation, the sign of the change in the dielectric constant of the crystals was reversed. This has been attributed to the pinning of the dislocations, whose initial movement under stress might have caused the dielectric constant to increase. (11 refs.)
77317 Order-disorder phase transition and dielectric constant of ice Ic. I.Minagawa (Dept. of Sci., Kokugakuin Univ., Tokyo, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1641-5 (May 1983).
A theoretical study is made of the order-disorder transition of cubic ice Ic, where interaction energies between water molecules are considered, seven order parameters are used, and Takagi's method is employed. The ordered phase is ferroelectric when the interaction energies between neighbouring molecules are assumed to be the same as that in ice Ih. The transition is of the first order. The Curie-Weiss temperature θ_c is the same as that of Ih in the *c*-axis and the transition temperature is 1.29 θ_c =59K. The phase transition from ice Ic to Ih is discussed. (10 refs.)
77318 Dielectric properties of modified PZT ceramics. Long Wu, Chung-Chuang Wei, Tien-Shou Wu (Res. Inst. of Electronics & Electrical Engng., Nat. Cheng-Kung Univ., Tainan, Taiwan), Chain-Cheau Teng. *J. Phys. C (GB)*, vol.16, no.14, p.2803-12 (20 May 1983).
The dependence of the dielectric constant on the electric field of PZT ceramics can be well explained by the mechanism of domain wall motion. The mobility of the domain wall is increased by the A-site vacancies, due to the reduction of local stress in the domains which undergo domain switching. But O-site vacancies and the grain boundary act as pinning points for domain walls, so the domain wall motion is reduced when O-site vacancies dominate and the grain size is small. As a result, the dielectric constant after poling was larger than that before poling and the coercive field were reduced by the addition of A-site vacancy produce. But the opposite results were obtained, when the O-site vacancy produce was added. (22 refs.)
77319 Instability of the dielectric constant of Cd₂Nb₂O₇. G.A.Smolenskii, N.N.Kolpakova, S.A.Kizhaev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *JETP Lett. (USA)*, vol.36, no.8, p.361-4 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.295-8 (20 Oct. 1982). [received: June 1983]
An anomalous instability (over time) and an anomalous thermal hysteresis of the dielectric constant have been discovered in Cd₂Nb₂O₇ in the temperature interval 40-80K. The Cd₂Nb₂O₇ may contain an incommensurate phase in the temperature interval 80K= T_3 > T_2 > T_6 =44K. (9 refs.)
77320 Dipole moments of poly(p-chlorostyrene) chains determined in toluene and isopropyl-benzene. F.Blasco, E.Riande (Inst. de Plasticos y Caucho, Madrid, Spain). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.5, p.835-8 (May 1983).
In order to verify whether solvent effects are apparent in the determination of dipole moments, dielectric constant measurements were conducted in solutions

of poly(p-chlorostyrene) (PPCS) in toluene and isopropyl-benzene, over the temperature ranges 30-70 and 30-90°C, respectively. Values of the dipole moment were calculated. It was concluded that the dipole moments of PPCS chains should have a negligible temperature dependence. (16 refs.)
77321 Temperature dependence of the electron permittivity of IV-VI semiconductors. B.A.Volkov, V.P.Kushnir (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1869-72 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3293-7 (Nov. 1982). [received: May 1983]
The effect of optical lattice vibrations on the electron permittivity is studied using a model of the band structure of IV-VI compounds based on atomic p orbitals. It is shown that the permittivity of the centrosymmetric phase should decrease with increasing temperature. The temperature dependence of the permittivity is estimated for the nonsymmetric phase. 77.30 POLARIZATION AND DEPOLARIZATION EFFECTS

77322 Phenomenological theory of shock-induced polarisation. II. Mathematical treatment of the oscillogram. M.De Icaza-Herrera (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2360-5 (May 1983).
For pt.I see *ibid.*, vol.54, no.5, p.2352 (1983). The mathematical treatment of the theory presented in the preceding paper is detailed. Less than ten distance measurements on the oscillogram are enough to determine the dielectric properties of the shocked medium and the polarisation discontinuity across the shock front. The last one agrees approximately with Allison's mechanical polarisation (1965), but does not depend on the dielectric properties of the shocked medium. The treatment is valid for the dipolar orientation and bond scission models of shock-induced polarisation. Finally, the effect of a changing pressure profile is discussed. (8 refs.)
77323 Investigations of the thermally stimulated change of the surface potential of FEP electrets. W.Stark, R.Danz (Inst. fur Polymerenchem. 'Erich Correns', Akad. der Wissenschaften, Teltow-Seehof, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K101-3 (16 March 1983).
The determination of the thermally stimulated charge decay (TSCD) by changes of the surface potential has proved an efficient tool for characterizing electrets. Numerous investigations have already been performed with negatively charged fluoropolymers PTFE (polytetrafluoroethylene) and FEP (copolymer of tetrafluoroethylene and hexafluoropropylene) because of the high electret stability of these substances. The comparative consideration of the literature data reveals in some measurements an increase of the surface potential preceding its typical decrease at elevated temperatures, while in other measurements the surface potential remains unchanged up to the onset of the decrease. The increase of the surface potential was interpreted by the decrease of a hidden positive charge or heterocharges. The authors suggest that previous authors have misinterpreted measurements of surface charges by neglecting the influence of dimensional changes with temperature. (10 refs.)

77.40 DIELECTRIC LOSS AND RELAXATION

77324 Dielectric and dynamic-mechanical behaviour of ethylene-vinyl alcohol copolymers. F.P. La Mantia, G. Spadaro (Istituto di Ingegneria Chimica, Univ. of Palermo, Palermo, Italy).

Mater. Chem. & Phys. (Switzerland), vol.8, no.4, p.315-21 (April 1983).

Dynamic-mechanical and dielectric measurements on ethylene-vinyl alcohol copolymers with two different vinyl alcohol contents and, for comparison, on polyvinylalcohol and low density polyethylene have been carried out in order to clarify the nature of the relaxation peak. The relaxation peak observable in the dielectric loss curves of the copolymers has been assigned to the interfacial polarization, MWS type, occurring between hydrogen bonded hydroxyl groups and the apolar polyethylene segments. The shoulder also present in the ϵ'' -T curves of the copolymers seems to correspond to the glass transition peak which is hidden since the dielectric loss curve increases quickly because of the MWS polarization peak. The frequency-temperature map confirms this opinion. (9 refs.)

77325 Dielectric relaxation and dipole moment measurements of *N*-methylacetamide in benzene and dioxane solutions at different temperatures from microwave absorption studies. J.S. Dhull, D.R. Sharma (Dept. of Phys., Himachal Pradesh Univ., Simla, India), D.S. Gill, K.N. Lakshminarayana. *Indian J. Phys. Part B*, vol.56B, no.6, p.334-43 (Dec. 1982). [received: May 1983]

Using standing wave techniques, dielectric constant (ϵ') and dielectric loss (ϵ'') of dilute solutions of *N*-methylacetamide (NMA) in benzene and dioxane have been measured at 9.987 GHz at 25, 35, 45 and 55°C. Following the single frequency concentration variational method, dielectric relaxation time (τ) and the dipole moment (μ) have been evaluated. The results show different types of molecular association of NMA in benzene and dioxane solutions. At low concentrations of NMA in benzene, the association is solute-solvent type which changes into the solute-solute association (dimer formation) at relatively higher concentrations of NMA in benzene. Energy parameters (ΔF^\ddagger , ΔH^\ddagger and ΔS^\ddagger) for the dielectric relaxation of NMA in benzene and dioxane solutions have been calculated from the Eyring's rate equations and compared with corresponding viscosity parameters. A comparison between these two sets of parameters shows that the dielectric relaxation like viscosity, can also be considered as a rate process. (17 refs.)

77326 Structure and dipole relaxation mechanisms in the cyclic alcohols cyclopentanol to cyclo-octanol. M. Shablaikh, L.A. Dissado, R.M. Hill (Chelsea Coll., Univ. of London, London, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.3, p.369-417 (March 1983). The phase structure and stability of the solid phases of cyclopentanol, cyclohexanol, cycloheptanol and cyclo-octanol have been investigated by examining the dielectric relaxation mechanisms in these materials. It has been found that a number of the transitions between the stable phases are time-dependent as well as temperature-dependent and these effects have given rise to misconceptions in the phase structure. For the cyclic alcohols examined the stable phases have been characterised and where possible this has been done in terms of dipolar cluster distributions. The results of the dielectric investigation are discussed in terms of the structure of the materials. (38 refs.)

77327 The influence of thermal measurement conditions on the results of dielectric measurements in PLZT ceramic with diffused phase transition. F. Glasse (Inst. of Experimental Phys., Univ. of Wrocław, Wrocław, Poland). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.K121-3 (16 April 1983).

The author reports on a change of the temperature dependences of the DC and the loss tangent change, when the measurement conditions get nearer to quasi-stationary conditions. For this purpose a PLZT sample was annealed at 300°C during 48 h and then cooled a) with a cooling rate $dT/dt = -0.97$ K/min and b) with $dT/dt = -0.014$ K/min. During cooling the DC and the loss tangent were measured by an automatic capacitance bridge at a frequency of 1 kHz. The AC measuring field had a magnitude of 140 V/cm. (5 refs.)

77.60 PIEZOELECTRICITY AND ELECTROSTRICTION

(for piezo-optical effects, see 78.20H)

77328 Distribution of axisymmetric waves in a piezoceramic planar cylinder. O.Ya. Grigorenko, I.A. Loza, M.O. Shul'ga. *Dopov. Akad. Nauk UKRSR. Ser. A (USSR)*, no.3, p.34-8 (1983). In Ukrainian.

Deals with the problem of propagation of axisymmetric waves in a hollow cylinder and a plane layer of piezoceramic material. Displacements and an electric potential are represented as a radial coordinate power series. A numerical analysis of the obtained dispersion ratios is presented for a long-wave approximation. (7 refs.)

77329 The theory of nonlinear dielectrics. Polar, polarizable molecules. R.L. Fulton (Dublin Inst. for Advanced Studies, School of Theoretical Phys., Dublin, Ireland).

J. Chem. Phys. (USA), vol.78, no.11, p.6877-84 (1 June 1983).

Some aspects of the nonlinear dielectric behavior of a simple fluid composed of polar, polarizable particles having spherical hard cores are discussed. In particular, the connection between the lowest order nonvanishing nonlinear dielectric constant and fluctuations in the polarization and dipole densities is found. By ignoring certain high order fluctuations, the nonlinear dielectric constant is related to two, three, and four body correlation functions. A further approximation involving the neglect of short range angular correlations produces the analog of the Onsager connection for the linear dielectric

constant. The connections given here differ from all previous proposals. Some examples are given to illustrate the relative importance of electrostriction, anisotropic polarizabilities, and permanent dipole moments and the difference with previous proposals. (18 refs.)

77330 Piezoelectric properties of modified PZT ceramics. Long Wu, Chung-Chuang Wei, Tien-Shou Wu (Res. Inst. of Electronics & Electrical Engng., Nat. Cheng-Kung Univ., Tainan, Taiwan), Hsi-Chuan Liu. *J. Phys. C (GB)*, vol.16, no.14, p.2813-21 (20 May 1983).

The influence of impurities on piezoelectric parameters such as the radial coupling factor k_r and mechanical quality factor Q_m have been measured. A mechanism of internal friction is proposed. The effects of the interaction of 90° domain walls with defects introduced by impurities are explained. A-site vacancies reduce the local stress in a domain, making it become remarkably mobile. The easy motion of the domain wall causes the internal friction in the ceramics to increase and thus Q_m to decrease. O-site vacancies act as pinning points for the domain walls, so that domain wall motion is reduced when O-site vacancies are dominant, and Q_m is raised due to the reduced internal friction. The effect of poling conditions is also discussed. (26 refs.)

77331 Longitudinal piezoelectric strain measurements of poly(vinylidene fluoride) films. K. Uchino (Dept. of Phys. Electronics, Tokyo Inst. of Technol., Tokyo, Japan), L.E. Cross.

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.765-71 (May 1983). The longitudinal piezoelectric strain of poly(vinylidene fluoride) (PVF₂) films has been measured at room temperature using a high-sensitivity AC capacitance-type dilatometer. The DC bias field dependence of the piezoelectric strain coefficient d_{33} has been determined. The polarization-related electrostrictive coefficient Q_{33} obtained is several hundred times larger than the value in normal piezoelectric oxide crystals and is of opposite sign. (11 refs.)

77332 Elastic, dielectric, and piezoelectric properties of cancrinite carbonate single crystals. I.M. Silvestrova, I.B. Kobayakov, F.A. Belimenko (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USSR)*, vol.24, no.11, p.1839-42 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3241-7 (Nov. 1982). [received: May 1983]

The complete set of the elastic, dielectric, and piezoelectric constants was determined for zeolite-like aluminosilicate cancrinite carbonate. The piezoelectric constants were found by a resonance method and the elastic constants by employing ultrasound pulses. The dependences of the elasticity and of the piezoelectric activity on the defect and chemical compositions were observed for the investigated single crystals. The high value of the Poisson ratio $\sigma = 0.45-0.58$ indicated a weak stability of these crystals as a mechanical system, whereas the high value of the piezoelectric modulus $d_{15} = -16.5 \times 10^{-12}$ C/N indicated that cancrinite carbonate was a strong linear piezoelectric. (14 refs.)

77333 Applications of piezoelectric materials containing niobium oxide. E.G. Fesenko, A.Ya. Dantsiger, L.A. Reznichenko, L.A. Shilkina, O.N. Razumovskaya (Sci.-Res. Inst. of Phys., State Univ., Rostov-on-Don, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1389-91 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2262-6 (Nov. 1982). [received: May 1983]

The selection of materials containing NbO₃ for various applications is studied by examining the relationship between the structural and electrophysical parameters in NaNbO₃-based systems. These relationships are compared with those for PbZrO₃-PbTiO₃ systems, and it is found that they are both more complicated and more ambiguous. It is shown that the main parameters of NaNbO₃ materials (their small dielectric constant, high sound velocity, and low density) cannot be achieved in other solid solution systems. It is concluded that NaNbO₃ materials are best suited for application in bulk and surface wave devices in the HF and UHF ranges. Many compositions with a higher dielectric constant can also be used at lower frequencies. (7 refs.)

77.80B Transitions and Curie point

77334 High-temperature phase transitions in pure and deuterated ammonium dihydrogen phosphate: conductivity and dielectric measurements. V.K.Subhadra, U.Syamaprasad, C.P.G.Vallabhan (Dept. of Phys., Univ. of Cochin, Cochin, India).

J. Appl. Phys. (USA), vol.54, no.5, p.2593-6 (May 1983).

Results of axiswise measurements of the electrical conductivity (DC and AC) and dielectric constant of $\text{NH}_4\text{H}_2\text{PO}_4$ confirm the occurrence of the recently suggested high-temperature phase transition in this crystal (at 133°C). The corresponding transition in $\text{ND}_4\text{D}_2\text{PO}_4$ observed here for the first time takes place at 141.5°C . The mechanism involved in these transitions and those associated with the electrical conduction and dielectric anomalies are explained on the basis of the motional effects of the ammonium ions in these crystals. Conductivity values for deuterated crystals give direct evidence for the predominance of protonic conduction throughout the entire range of temperatures studied (30 – 260°C). (23 refs.)

77335 Influence of external electric field on incommensurate-commensurate phase transition in K_2SeO_4 and $(\text{NH}_4)_2\text{BeF}_4$ crystals. I. Static properties. O.Hudak (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).

J. Phys. C (GB), vol.16, no.14, p.2641-58 (20 May 1983).

The author presents a study of the influence of an external electric field on the incommensurate-commensurate phase transition in K_2SeO_4 and $(\text{NH}_4)_2\text{BeF}_4$ -like crystals. Within the constant-amplitude approximation the same type of thermodynamic potential is found in both cases. The phase diagram in the E - T phase plane is found and should exhibit a Lifshitz point. The susceptibility of the incommensurate phase diverges at the transition point while that of the commensurate phase remains finite. (25 refs.)

77336 Influence of external electric field on incommensurate-commensurate phase transition in K_2SeO_4 and $(\text{NH}_4)_2\text{BeF}_4$ crystals. II. Dynamic properties. O.Hudak (Inst. of Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).

J. Phys. C (GB), vol.16, no.14, p.2659-70 (20 May 1983).

For pt.1 see *ibid.*, vol.16, no.14, p.2641 (1983). External electric field influences the fluctuation spectrum of the phase variable in the incommensurate phase of K_2SeO_4 and $(\text{NH}_4)_2\text{BeF}_4$ -like crystals. As well as the usual zero-field branches (phason-like, acoustic-like) a new branch appears for non-zero fields. Analytic description of all these branches is given within the harmonic approximation. (7 refs.)

77337 Switching properties of SBN single crystals. G.Borchardt, J.von Cierninski, G.Schmidt (Sektion Phys., Martin-Luther-Univ. Halle-Wittenberg, Halle, Germany).

Phys. Status Solidi a (Germany), vol.76, no.2, p.K141-5 (16 April 1983).

The authors study the decrease of the switched polarisation observed with increasing number of hysteresis cycles in SBN ($\text{Sr}_x\text{Ba}_{1-x}\text{Nb}_2\text{O}_6$) single crystals. The field dependence of the permittivity and the electromechanical strain were measured by a method described by Schmidt et al. (1982). (14 refs.)

77338 Dielectric properties and ferroelectric phase transitions in mixed $\text{Rb}_x(\text{NH}_4)_{1-x}\text{HSeO}_4$ crystals. Z.Czapla, O.Czupinski, L.Sobczyk (Inst. of Chem., Univ. of Wrocław, Wrocław, Poland), J.Mroz, H.Pykacz.

Phys. Status Solidi a (Germany), vol.76, no.2, p.K155-7 (16 April 1983).

The mixed crystals $\text{Rb}_x(\text{NH}_4)_{1-x}\text{HSeO}_4$ have been grown at 303K from solutions of the total content of 0.2 moles of both salts. The composition has been determined by measuring the density of the mixed crystals. For dielectric studies the samples were cut perpendicularly to the ferroelectric b axis. Measurements are presented of the ferroelectric transition temperature, electric permittivity, spontaneous polarisation and hysteresis. (9 refs.)

77339 Anomalous broadening of phase transitions in lanthanum lead zirconate titanate. V.M.Ishchuk, A.A.Galkin, E.A.Zavadskii, E.M.Morozov.

Sov. Phys.-Solid State (USA), vol.24, no.12, p.2099-101 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3684-8 (Dec. 1983).

An experimental investigation was made of broad phase transitions to the paraelectric state of the lanthanum lead zirconate titanate systems. The broadening of these transitions was found to depend on the position of the composition of a sample in the phase diagram and the strongest broadening was observed for a composition within the hysteresis range separating the ferroelectric and antiferroelectric states. The experimental results were interpreted on the basis of a model allowing for the existence of regions with different types of dipole ordering. (12 refs.)

77.80D Domain structure and effects; hysteresis

77340 Changes in the domain structure of lead germanate single crystals. V.Ya.Shur, V.V.Letchev, Yu.A.Popov (A.M. Gorki Univ. State Univ., Sverdlovsk, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1957-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3444-6 (Nov. 1982). [received: May 1983]

It is known that the polarization of freshly grown lead germanate, $\text{Pb}_2\text{Ge}_2\text{O}_7$, single crystals cannot be switched by an electric field and that domains cannot be observed in these crystals. Normal dielectric hysteresis loops and domains penetrating right across a crystal are observed only after 'conditioning' in an external electric field. The characteristics of the domain structure of freshly prepared crystals (the initial domain structure) are usually attributed to the pinning of domain walls by mechanical stresses or space charges. The authors investigated the changes in the initial domain structure occurring in external electric fields. (3 refs.)

77.85 ELECTRICAL RESONANCES

77341 Paraelectric resonance study of $\text{KCl}:\text{Li}^+$. F.Holuj (Dept. of Phys., Univ. of Windsor, Windsor, Ontario, Canada), F.Bridges.

Phys. Rev. B (USA), vol.27, no.9, p.5286-93 (1 May 1983).

A paraelectric resonance study has been made of $\text{KCl}:\text{Li}^+$ over the frequency range 20 – 150 GHz . The data have been fitted to a (111)-dipole model. The best-fit tunneling parameters (including the estimated systematic errors) are $\eta = -11.34 \pm 0.4$, $\mu = -3.55 \pm 0.4$, and $\nu = 0.21 \pm 0.4$. The electric dipole moment is $5.683 \pm 0.06\text{ D}$. These parameters are compared critically with the existing data on $\text{KCl}:\text{Li}^+$. (18 refs.)

77.90 OTHER TOPICS IN DIELECTRIC PROPERTIES AND MATERIALS

77342 On the theory of nonlinear dielectrics. R.L.Fulton (Lab. for Phys. Chem., Univ. of Amsterdam, Amsterdam, Netherlands).

J. Chem. Phys. (USA), vol.78, no.11, p.6865-76 (1 June 1983).

A simple yet general prescription for finding the connections between phenomenological coefficients and susceptibilities for nonlinear dielectrics is found. In the linear realm the standard connections are recovered. The connections found between the nonlinear susceptibilities and phenomenological coefficients for isotropic polar media are found to differ from previous proposals, all of which rely on extensions of either the procedure of Onsager or of Kirkwood and Fröhlich. Application is made to two simple models; the first that of polar fluids, the second of nonpolar, polarizable fluids. (31 refs.)

77343 Electric susceptibility of mixed cerium/lanthanum ethyl sulfate crystals. R.J.Stubbs, J.P.Harrison (Dept. of Phys., Queen's Univ., Kingston, Ontario, Canada).

J. Low Temp. Phys. (USA), vol.51, no.5-6, p.679-90 (June 1983).

Measurements of the dielectric susceptibility of a series of lanthanum ethyl sulfate/cerium ethyl sulfate crystals (5–100 at.% Ce) have been made over the temperature range 0.05 – 20K . The results confirm the Jahn-Teller distortion in pure cerium ethyl sulfate, demonstrate a distortion for up to 25% La in the mixed crystals, and confirm the inversion of the zero-temperature crystal field splitting at about 40% La. The dipole moment of the cerium ion was found to be $(5.2 \pm 0.4) \times 10^{-31}$ and $(6.7 \pm 0.5) \times 10^{-31}\text{ C m}$ for the applied electric field perpendicular and parallel to the c axis, respectively. 77344 Effects of semiconducting oxide films on the reflectivity change in a metal on radiation heating. A.V.Burmistrov.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.965-8 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.305-9 (Aug. 1982). [received: April 1983]

The reflectivity of a metal heated by radiation in air may change on account of growth of the oxide film and also because of diffusion of oxygen into the metal under the oxide. The author considers another physical factor that governs the energy deposition in the specimen, viz., the increase in the conductivity of the oxide with temperature. It is shown that this factor may prevent the attainment of high absorptivity in the high-temperature stage of the process and slow down or even stop the heating. Another consequence of the temperature dependence of the conductivity relates to the fall in transparency of the coating on heating and the related reduction in the number and amplitude of the interference oscillations in the reflection coefficient, as well as the additional increase in absorption in the low-temperature stage, which accelerates the transition to active oxidation (ignition). (13 refs.)

78.20B General theory (for pure homogeneous materials)

77345 Prediction of a resonance-enhanced laser-beam displacement at total internal reflection in semiconductors. J.L.Birman, D.N.Pattanayak, A.Puri (Phys. Dept., City Coll., City Univ. of New York, New York, NY, USA).

Phys. Rev. Lett. (USA), vol.50, no.21, p.1664-7 (23 May 1983).

Lateral Goos-Hanchen shifts can be increased by factors of 10 – 100 for laser frequency near an exciton-polariton resonance in semiconductors. A 'negative' shift can occur for laser frequency ω_L in the pseudogap $\omega_0 < \omega_L < \omega_1$. Surface irregularities can be probed with this effect. (10 refs.)

77346 Electromagnetic wave propagation in the uniaxial antiferromagnetic crystals FeF_2 , CoF_2 , MnF_2 . J.Brandmüller (Sektion Phys., Univ. München, München, Germany), A.Lehmeyer, K.M.Haussler, L.Merten.

Phys. Status Solidi b (Germany), vol.117, no.1, p.323-8 (1 May 1983).

In the most general form the matter equations of electrodynamics contain the magneto-electric tensor in addition to the electric and magnetic permeability tensor. By group-theoretical methods, however, it is shown that for crystals belonging to the magnetic point group $4'/\text{mmm}$ the magneto-electric tensor vanishes. Important examples for this point group are the antiferromagnets

FeF_2 , CoF_2 , and MnF_2 . Regarding this essential simplification a generalized Fresnel's equation of the wave normals is derived for these antiferromagnetic crystals. The Fresnel's equation has two solutions describing the magnitudinal and directional dispersion of the refractive index for the two corresponding waves. The limiting cases of these two solutions agree with results already known from literature. Besides, the polarization of both waves is determined. (11 refs.)

78.20D Optical constants and parameters

77347 Infrared optical constants of PtSi. J.M.Pimbley, W.Katz (Corporate Res. & Dev., General Electric Co., Schenectady, NY, USA). *Appl. Phys. Lett.* (USA), vol.42, no.11, p.984-6 (1 June 1983).

Knowledge of the infrared optical constants of PtSi is required for quantum yield calculations of Schottky barrier IR imagers with PtSi electrodes. The authors employ Rutherford backscattering spectrometry to identify the PtSi phase and calculate the infrared optical constants from reflectance data by a Kramers-Kronig analysis technique. Several examples of quantum yield calculations for different imager structures using the calculated optical constants are given. (18 refs.)

77348 Effect of electron-electron interaction on infrared absorption by small metallic particles. B.I.Shklovskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.36, no.8, p.352-5 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz.* (USSR), vol.36, no.8, p.287-9 (20 Oct. 1982). [received: June 1983]

It is shown that allowance for electron repulsion at low temperatures, which leads to neutrality of small metallic particles, decreases by unity the exponent a in the power-law dependence of the coefficient of absorption of infrared radiation K on frequency ($K \propto \omega^a$), as compared with existing theories. (5 refs.)

77349 Determination of thermal variation of the refractive index of cubic crystals and measurement of their light absorption coefficient. A.A.Zhilonits, E.K.Maldutis, S.V.Sakalaukas.

J. Appl. Spectrosc. (USA), vol.36, no.5, p.580-5 (May 1982). Translation of: *Zh. Prikl. Spektrosk.* (USSR), vol.36, no.5, p.811-16 (May 1982). [received: Feb. 1983]

Presents an iterative scheme for the calculation of the thermoelastic displacements which arise in cubic crystals upon local heating by laser radiation. The variation of the refractive index and the total temperature coefficient $\Delta n/\Delta T$ is determined with the help of the expressions obtained. The light absorption coefficient of KCl, KBr, KCl, and NaCl crystals is measured at a wavelength $\lambda = 1.06 \mu\text{m}$. (10 refs.)

77350 Refractive index changes of ion-implanted quartz. H.Beez, D.Fasold, H.Karge (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).

Phys. Status Solidi a (Germany), vol.76, no.2, p.K171-4 (16 April 1983).

The authors analyze the thermal stability of the refractive index change with regard to different disorder formation stages. Synthetic α -quartz samples (Z-cut) were implanted with Ar^+ (150 keV) and B^+ (70 keV) ions at room temperature. Measurements of the optical reflectivity were carried out to determine the refractive index of the damaged surface layers. (6 refs.)

77351 Changes in the polarization and diffraction of light at dislocations with screw components in plastically deformed cadmium sulfide. V.Ya.Emelin, N.V.Klassen (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1876-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela* (USSR), vol.24, no.11, p.3305-10 (Nov. 1982). [received: May 1983]

The propagation of light in plastically deformed cadmium sulfides was studied for large angles between the wave vector and slip bands. A deflected beam with a modified polarization was observed. This was attributed to the effects of elastic fields and of the cores of screw dislocations. Periodic oscillations of the intensity of the deflected beam indicated a periodic distribution of arrays of screw components of dislocations. (13 refs.)

77352 Temperature dependence of the refractive index of amorphous As_2S_3 and As_2Se_3 films near 300K. T.F.Mazets, S.K.Pavlov, E.I.Shifrin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.446 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz.* (USSR), vol.8, no.17-18, p.1036-8 (Sept. 1982). [received: May 1983]

The authors report the first measurements of dn/dT of amorphous As_2S_3 and As_2Se_3 films. At a fixed sample temperature, the differential spectrum of the temperature-modulated transparency is recorded, rather than the ordinary transparency spectrum. The thermal modulation is achieved by a 1-kHz periodic heating of the films. Instead of determining the position of the interference maximum, where the light intensity varies only slightly, they determine the 'null' position of the differential spectrum. The null position can be determined much more accurately, since the minimum measurable modulation depth $\Delta I/I$ is 10^{-6} . (9 refs.)

77353 Temperature coefficient of the phanite refractive index. N.D.Dovga.

Ukr. Fiz. Zh. (USSR), vol.28, no.4, p.605-7 (April 1983). In Russian. The prism method was used to investigate the temperature dependence of the refractive index n , of colourless phanite with composition $0.9 \text{ZrO}_2 \cdot 0.1 \text{Y}_2\text{O}_3$ at $\lambda = 632.8 \text{ nm}$. It is found that n linearly grows in the temperature interval 290 to 820K with coefficient $\beta = \Delta n/\Delta T = 6.075 \times 10^{-6} \text{ K}^{-1}$. The thermo-optical constant of phanite has been determined to be $V = \beta/(n-1) - \alpha = -5.425 \times 10^{-6} \text{ K}^{-1}$. The permittivity was found to be $\epsilon_0 \approx 20$. (6 refs.) 78.20F Birefringence

(inc. stress birefringence, flow birefringence, etc)

77354 The dependence of the trajectory of the extraordinary ray as the crystal rotates on the incident angle. Zhang Zhixiang, Feng Qingrong (Dept. of Phys., Peking Univ., Peking, China).

Acta Sci. Nat. Univ. Pekin. (China), no.5, p.77-80 (1982). In Chinese. Using data computed for Iceland spar crystal, the authors plotted a series of diagrams showing the dependence of the trajectory of the extraordinary ray as the crystal rotates on the incident angle. (1 ref.)

77355 Birefringence and structural defects in Cu_2O crystals. A.Haydar, R.Labusch (Inst. für Angewandte Phys., Tech. Univ. Clausthal, Clausthal Zellerfeld, Germany), A.Coret.

J. Appl. Phys. (USA), vol.54, no.5, p.2605-10 (May 1983).

The authors have investigated the birefringence in Cu_2O crystals which is induced by internal stress. The observed birefringence near precipitations, called 'teratoides', in as-grown crystals is shown to be related to pile-ups formed in (100) planes. This interpretation is supported by the direct observation of etch pits in the birefringent regions near teratoides and by the observation of the same birefringence in other pile-ups that are not related to teratoides. The analysis of the birefringence using a quarter-wave plate shows that the slow principal axis in the crystal is parallel to Burgers vector of dislocations in pile-ups. Comparison of the birefringence observed in plastically deformed crystals with that near pile-ups in as-grown crystals, indicates the formation of pile-ups by plastic deformation. The pile-ups in this case are perpendicular to the branches of cross shaped birefringent regions. This result is in agreement with the prediction of the excitonic photoconductivity measurements. (20 refs.)

77356 Electric birefringence and molecular polarisability of $\text{CF}_2\text{ClCF}_2\text{Cl}$. A.-M.Benoit-Denis (Lab. de Thermomagnétisme, Univ. de Nancy I, Vandœuvre les Nancy, France).

Mol. Phys. (GB), vol.49, no.1, p.91-101 (May 1983). In French.

Measurements of the refractive index, density, dielectric constant and Kerr constant are reported for liquid $\text{CF}_2\text{ClCF}_2\text{Cl}$ over the temperature range 193-273K, at different wavelengths. Since the compound can exist in the trans (C_{2h}) and gauche form (C_2), the values of the principal molecular polarizabilities of both the isomers are obtained. The Langevin-Born formula is used to express the Kerr constant, since the Lorentz model is correct in the case of a liquid such as $\text{CF}_2\text{ClCF}_2\text{Cl}$ for which the molecular interactions are only dipolar; the author has not included the contributions of the first and second hyperpolarizabilities, (not measured); to know the composition of the equilibrium mixture over the temperature range 193-273K, the Debye formula is used; the principal polarizability, which is orthogonal to the trans form symmetry plane, is calculated from bond polarizability theory. (16 refs.)

77357 Investigation of the photoinduced birefringence in GaP. A.L.Imanova, Ch.O.Kadzhaz, I.A.Mamedbeili, E.Yu.Saleev (Inst. of Phys., Acad. of Sci., Baku, Azerbaïdzhans SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1955-6 (Nov. 1982). Translation of: *Fiz. Tverd. Tela* (USSR), vol.24, no.11, p.3441-4 (Nov. 1982). [received: May 1983]

A photoinduced birefringence was previously observed in compensated GaAs crystals subjected to an electric field and the magnitude of this effect as well as its sign depended strongly on the region illuminated with additional focused radiation. The authors investigated in a similar manner the electrooptic properties of a GaP crystal subjected to an electric field and strongly absorbed illumination. Measurements of the electrooptic parameters were made at room temperature by the polarization-optical method. (5 refs.)

78.20H Piezo-, elasto- and acousto-optical effects

77358 Indicatrix and the piezooptical properties of diglycine nitrate crystals. V.M.Varikash, N.A.Romanyuk, B.G.Myslyk. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.977-81 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.319-23 (Aug. 1982). [received: April 1983]

The authors have studied the piezooptical properties of diglycine nitrate, established the orientation of the axes of the optical indicatrix as well as the limits of optical frequency, temperature, and mechanical stress for which diglycine nitrate may be utilized. (8 refs.)

77359 Photoelasticity of $\text{Ba}_2\text{Sr}_{1-x}\text{Nb}_2\text{O}_6$ near the ferroelectric phase transition. I.A.Andreev (A.I. Gertsens State Pedagogical Inst., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.9, p.460-1 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1067-71 (Sept. 1982). [received: May 1983]

The relaxation of the polarization, which is the parameter of the phase transition, governs the thermal anomalies in the dielectric and electromechanical properties of the ferroelectric barium-strontium niobate, $\text{Ba}_2\text{Sr}_{1-x}\text{Nb}_2\text{O}_6$ (BSN). The author reports the first observation of a strong temperature dependence, unusual for ferroelectrics, of the photoelasticity of BSN. The photoelastic constant β_{31}^E of $\text{Ba}_{0.39}\text{Sr}_{0.61}\text{Nb}_2\text{O}_6$ single crystals vanishes at $T_c=80^\circ\text{C}$. (7 refs.)

78.20J Electro-optical effects

77360 Colored and black liquid crystalline mixtures with new anthraquinone dyes. G.Heppke, B.Knippenberg, A.Moller, G.Scherowsky (Liquid Crystals Res. Group, Tech. Univ. of Berlin, Berlin, Germany).

Mol. Cryst. & Liq. Cryst. (GB), vol.94, no.1-2, p.191-204 (1983). Various yellow, red, and blue anthraquinone dyes have been synthesized. The structures of the dyes are presented and their properties are discussed with respect to the dichroic ratios, the color gamut, and the obtainable contrast in black colored liquid crystalline dye mixtures. Dichroic ratios of up to $N=10.2$ in NP 1132 and $N=12.3$ in RO-TN 404 are observed for single dyes. The compositions of achromatic dye mixtures exhibiting effective dichroic ratios of $N_{\text{eff}}=8.3$ in NP 1132 and $N_{\text{eff}}=10.5$ in RO-TN 404 are calculated. The influence of the positions of the absorption bands on the perceived contrast is studied. It is shown that by shifting the absorption bands of the dyes, the effective dichroic ratio can be increased to $N_{\text{eff}}=9.1$ in NP 1132 and $N_{\text{eff}}=11.4$ in RO-TN 404. (18 refs.)

77361 Dyes with negative dichroism for liquid crystal displays based on the guest-host effect. V.G.Rumyantsev, A.V.Ivashchenko, V.M.Muratov, V.T.Lazareva, E.K.Prudnikova, L.M.Blinov (Organic Intermediates & Dyes Inst., Moscow, USSR).

Mol. Cryst. & Liq. Cryst. (GB), vol.94, no.1-2, p.205-12 (1983). The novel approach is proposed to the synthesis of dyes with negative dichroism. The molecular models, which are adequate to the dichroic dyes, are shown. As an example of the approach, the synthesis and dichroic properties of some derivatives of the 2,2'-azoisimidazole are described. The time and contrast characteristics of the displays, based on the guest-host effect, are presented. (12 refs.)

77362 Ferroelectric liquid crystal electro-optics using the surface stabilized structure. N.A.Clark, M.A.Handschi, S.T.Lagerwall (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).

Mol. Cryst. & Liq. Cryst. (GB), vol.94, no.1-2, p.213-33 (1983). The strong linear coupling of the director \mathbf{n} to electric field \mathbf{E} in ferroelectric liquid crystals can be utilized to perform high-speed electro-optic switching suitable for device applications. The authors summarize the current understanding of the high-speed, bistable, threshold-sensitive electro-optic effects obtained in planar structures using surface interactions to suppress the spontaneous director helix characteristic of the bulk ferroelectric liquid crystal. (12 refs.)

77363 Electroabsorption in single crystal indium phosphide. T.M.McGinnity, G.G.Roberts (Dept. of Appl. Phys. & Electronics, Univ. of Durham, Durham, England).

Solid State Commun. (USA), vol.46, no.8, p.643-5 (May 1983). The electroabsorption properties of InP:Fe and InP:Cr single crystals in the long wavelength region of the fundamental absorption edge have been investigated. By means of several supporting experiments and improved instrumentation the authors have eliminated or compensated for several possible sources of error including photoconductivity and space charge. Using simple one electron theory they have thus obtained accurate values of the reduced effective mass in this important semiconductor. (15 refs.)

77364 Temperature dependence of electrogyration in alums. H.-J.Weber (Inst. fur Kristallographie, Univ. zu Koln, Koln, Germany).

Z. Kristallogr. (Germany), vol.161, no.3-4, p.293-7 (1982). The temperature derivative $\partial s_{123}/\partial T$ of the electrogyration coefficient s_{123} is negative in α - and positive in β -alums. In ammonium and ammonium substituted alums this change of sign is masked by a large positive temperature effect of the ammonium ion. The observed effect at room temperature, essentially of dynamic origin, results in all alums from a partial cancellation of different contributions. (6 refs.)

77365 The linear electro-optical effect in α -quartz: a new determination. L.Bohaty (Inst. fur Kristallographie, Univ. zu Koln, Koln, Germany).

Z. Kristallogr. (Germany), vol.161, no.3-4, p.299-302 (1982). The two independent electro-optic coefficients of α -quartz were redetermined at constant stress employing a sensitive dynamic method of optical interferometry. The results at room temperature and $\lambda=633\text{ nm}$ are: $r_{11}^{\text{eff}}=-0.481(8)$, $r_{231}^{\text{eff}}=-0.235(10)\times 10^{-12}\text{ m/V}$. (11 refs.)

78.20L Magneto-optical effects

77366 Anomalies in the magnetic circular dichroism of benzene in cyclohexane. W.Haberdtz (Sektion Chem., Humboldt-Univ. Berlin, Berlin, Germany), W.Thiemann, U.Jarzak.

Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.4, p.366-8 (April 1983). The authors have found that by introducing a 20 mm thick iron plate to shield the CD stress modulator from stray magnetic field apparently eliminates the previously reported magneto-optical anomaly. They conclude that the observed phenomenon seems to be an apparatus artefact. (7 refs.)

77367 Measuring the magneto-optic Kerr effect by diffraction. J.Kranz, C.Schrodter (Inst. fur Angewandte Phys., Univ. Dusseldorf, Dusseldorf, Germany).

Appl. Phys. A (Germany), vol.A31, no.2, p.59-63 (June 1983). A method is presented to measure the Magneto-optic Kerr Effect (MOKE) by diffraction. This is accomplished by giving the magnetized surface a magnetization distribution which functions like a linear diffraction grating. It is shown that the first and higher orders of the light diffracted by such a grating are produced by MOKE whereas the zero order approximately represents the reflectivity of the surface (given by the Fresnel formulae assuming zero magnetization). The procedure used here to form a grating is restricted to thin soft magnetic films, and has been demonstrated on evaporated Fe-Ni films. It uses the magnetic field of a pulse-driven meandered stripe-conductor placed in close contact with the film in the presence of a homogeneous external magnetic field. Experimentally determined Kerr intensities were compared with those measured by ellipsometric methods. Good agreement was found in the case of films with uniaxial anisotropy. For films with no anisotropy, the relative dependence of Kerr intensity vs. wavelength, polarisation and angle of incidence could be derived. (8 refs.)

77368 Magnetic gyration studies of mixed crystals of potassium chloride and potassium bromide. M.S.Vijayaraghavan (Technol. Div., Defence Electronics Res. Lab., Chandrayanagutta Lines, Hyderabad, India), V.Sivaramakrishnan.

Opt. Acta (GB), vol.30, no.5, p.653-8 (May 1983). Magneto-optical rotary dispersion studies have been made on mixed crystals of potassium chloride and potassium bromide. The data obtained are explained on the basis of a model which assumes an asymmetric distribution of anions about the cations. (9 refs.)

77369 Magneto-optical study of the fundamental absorption edge in $\text{Cd}_{1-x}\text{Mn}_x\text{Te}$. Nguyen The Khoi, J.Ginter, A.Twardowski (Inst. of Experimental Phys., Univ. of Warsaw, Warsaw, Poland).

Phys. Status Solidi b (Germany), vol.117, no.1, p.67-74 (1 May 1983). The fundamental absorption edge in $\text{Cd}_{1-x}\text{Mn}_x\text{Te}$ for $x=0.01, 0.05, 0.10, 0.20$ in the Faraday configuration, at magnetic fields up to 5 T and in the temperature range 1.8 to 293K is studied. Moreover the exciton spectrum of extremely thin samples (of less than $1\text{ }\mu\text{m}$) is measured. An additional structure on the σ^- edge is found. The appearance of that structure is supposed to be the effect of the mixing of exciton states in the zincblende structure. (8 refs.)

77370 Magneto-optic investigation of crystals containing Fe^{3+} ions by reflection of infrared radiation. G.S.Krinchik, V.E.Zubov, V.A.Lyskov (M.V. Lomonosov State Univ., Moscow, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.12, p.2119-20 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3716-18 (Dec. 1983). Reflection of radiation of photon energy 1-2.2 eV ($1.2-0.55\text{ }\mu$ wavelength range) and a highly sensitive magneto-optic system were used for the first time to determine the spectra of the equatorial Kerr effect (EKE) of single crystals of yttrium orthoferrite (YFeO_3) and yttrium iron garnet ($\text{Y}_3\text{Fe}_5\text{O}_{12}$). The spectral dependences of the EKE revealed singularities associated with the first crystal transitions in the Fe^{3+} ions. (6 refs.)

78.30 INFRARED AND RAMAN SPECTRA AND SCATTERING

77371 Calculated lifetime and decay mechanism of the 991 cm^{-1} mode in crystalline benzene at 1.6K. R.Righini, P.F.Fracassi, R.G.Della Valle (Istituto di Chimica Fisica, Univ. di Firenze, Florence, Italy).

Chem. Phys. Lett. (Netherlands), vol.97, no.3, p.308-12 (20 May 1983). The lifetime of the 991 cm^{-1} Ag mode in benzene crystal at 1.6K has been calculated in good agreement with the experimental value. The main decay mechanism has been shown to consist of a three-phonon scattering involving the $\nu_{10}\approx 860\text{ cm}^{-1}$ e_{2g} internal vibration and high-frequency lattice modes. (23 refs.)

- 77372 Spectral studies on new dioxouranium (VI) complexes of tridentate Schiff bases derived from salicylhydrazide and salicylaldehyde or substituted salicylaldehydes.** A.Syamal (Dept. of Appl. Sci. & Humanities, Kurukshetra Univ., Kurukshetra, India), D.Kumar. *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.87-91 (Feb. 1983). New dioxouranium (VI) complexes of the type $\text{UO}_2\text{LCH}_2\text{OH}$ (where LH_2 =Schiff base I) have been synthesized and characterized on the basis of elemental analysis, quantitative determination of ligand, conductance, molecular weight, magnetic susceptibility, IR, NMR and electronic spectra. The reactivity of the complexes towards bidentate ligands has been tested and dioxouranium (VI) heterochelates of the type $\text{UO}_2\text{L}(\text{AA})$ (where AA=bidentate NN donor ligand) have been synthesized. The complexes are non-electrolytes, diamagnetic and monomers. The $\text{UO}_2\text{LCH}_2\text{OH}$ complexes are six-coordinated and the heterochelates are seven-coordinated. (35 refs.)
- 77373 Spectroscopic studies of oxovanadium(IV) complexes of biguanide, dibiguanides and o-methyl-l-aminourea.** A.Syamal (Chem. Dept., Regional Engng. Coll., Kurukshetra, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.2, p.130-2 (Feb. 1983). The ESR (in diamagnetic nickel(II) complex matrix), IR and electronic spectra of oxovanadium(IV) complexes of biguanide; ethylene-, trimethylene-, tetramethylene-, hexamethylene-, piperazine-dibiguanides and of o-methyl-l-aminourea are recorded. The ESR spectra of all these complexes exhibit 8 perpendicular and 8 parallel lines. The ESR parameters exhibit 8 perpendicular and 8 parallel lines. The ESR parameters for a typical complex, viz. $\text{VO}(\text{OH})_2$ (biguanide) $_2$, are determined as $g_{\perp}=1.99$, $A_{\perp}=54$, $g_{\parallel}=1.94$, $A_{\parallel}=154$. The ESR parameters are very similar in the oxovanadium (IV) complexes of biguanide, o-methyl-l-aminourea and dibiguanides indicating the similarity of bonding in these complexes. This fact is further confirmed from the dipolar term $|A_{\perp}-A_{\parallel}|$ which is essentially constant. The observed low values of $\nu(\text{V}=\text{O})$ ($\sim 940\text{ cm}^{-1}$) are consistent with the strong out-of-plane $d\pi-\pi$ bonding. These complexes exhibit three electronic spectral bands due to $d_{xy}-d_{xz}$, d_{yz} , $d_{xy}-d_{xz}-d_{yz}$ and $d_{xy}-d_{yz}$ transitions. (9 refs.)
- 77374 Raman microprobe study of recrystallization in ion-implanted and laser-annealed polycrystalline silicon.** S.Nakashima, Y.Inoue, M.Miyauchi, A.Mitsuihira (Dept. of Appl. Phys., Osaka Univ., Yamadaoka, Japan), T.Nishimura, T.Fukumoto, Y.Akasaka. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2611-17 (May 1983). Implantation-amorphized polycrystalline silicon layers which are directly deposited on single-crystal Si are annealed by a scanning CW laser. The crystallinity of the annealed layers has been examined by a Raman microprobe in combination with polarization measurements. The Raman spectra measured for the specimens annealed at various power levels reveal that the polysilicon layer is regrown liquid epitaxially and is transformed into single crystal at high annealing power levels and that the regrowth at lower power levels is governed by the mixture of solid and liquid epitaxial processes. It is found that for specimens annealed at high power levels the tensile stress in the annealed layer is relaxed to a certain extent, though the weak residual strain still remains. The Raman microprobe spectra from the boundary region between the annealed and amorphous layers are recorded by making the probe laser beam traverse the boundary region. This technique enables the authors to investigate the variation in crystallinity and the regrowth process in the boundary zone which is found to be less than $10\text{ }\mu\text{m}$ width. (20 refs.)
- 77375 Effects of interlamellar forces on longitudinal acoustic modes of n-alkanes.** M.Kobayashi, K.Sakagami, H.Tadokoro (Dept. of Macromolecular Sci., Faculty of Sci., Osaka Univ., Osaka, Japan). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6391-8 (1 June 1983). Effects of the interlamellar interactions in n-alkane crystals on the longitudinal acoustic modes (LAM), including both the fundamental and the higher overtones, were investigated on the basis of the polarized Raman spectra of $n\text{-C}_{28}\text{H}_{58}$, $n\text{-C}_{30}\text{H}_{62}$, $n\text{-C}_{34}\text{H}_{70}$, and $n\text{-C}_{36}\text{H}_{74}$ crystallized in the orthorhombic II form (a double layer polytype of the monoclinic form). The LAM-1 bands of this crystal modification split into a doublet consisting of the (cc) and (bc) polarization components separated by about 6 cm^{-1} . The frequency gaps of the LAM-m bands were found to decrease with m (approximately proportional to m^{-1}). Theoretical considerations on the correlation field splitting and the scattering intensities of the LAM bands led to the conclusion that the observed band splitting was caused by the intermolecular force acting between the successive monomolecular layers. The intrinsic value of the Young modulus of the n-alkane molecules free from the external forces in the crystalline state and the strength of the interlayer force were evaluated from the observed frequencies of the two components of LAM using a simple dynamical model. By comparing the Raman spectra of $n\text{-C}_{28}\text{H}_{58}$ and $n\text{-C}_{30}\text{H}_{62}$ between the triclinic and orthorhombic II modifications, it was concluded that the effect of the lateral force on the LAM was not so significant as that of the longitudinal force. (39 refs.)
- 77376 The far-infrared spectrum of ice Ih in the range 8-25 cm^{-1} . Sound waves and difference bands, with application to Saturn's rings.** O.Mishima, D.D.Klug, E.Whalley (Div. of Chem., Nat. Res. Council, Ottawa, Ontario, Canada). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6399-404 (1 June 1983). The absorption spectrum of single crystals of ice Ih with the light traveling perpendicular or at 5° to the c axis has been measured in the frequency range 8-25 cm^{-1} at 80, 100, 150, and 202K. At high frequencies, the absorptivity is proportional to the fourth power of the frequency, and is caused by fundamental hypersonic waves having wavelengths of about $100\text{ }\text{\AA}$. At low frequencies, it is probably caused by difference bands from the translational lattice vibrations. The theory of the intensity of binary combination bands of ionic crystals has been specialized to the low-frequency difference bands. Ice Ih has been assumed to have the same absorptivity as ice Ic, and ice Ic has been represented by an ordered crystal that resembles spherulite. The model fits the measured absorptivity of ice Ih assuming that the difference bands arise mostly from the strong first-order band centered at $\sim 230\text{ cm}^{-1}$. The acoustic branches do not contribute significantly. The absorptivity, extrapolated to 3.0 cm^{-1} and interpolated to 85K by means of the theory, was used to determine the mean thickness of ice in Saturn's rings from the measured thermal component of the brightness temperature of the rings. If the slab model is used and scattering is neglected, the mean thickness is $30\pm 10\text{ cm}$. (20 refs.)
- 77377 Absorption spectra of cold dilute solid solutions.** R.Holland, W.B.Majer, II, S.M.Freund, W.H.Beattie (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *J. Chem. Phys. (USA)*, vol.78, no.11, p.6405-14 (1 June 1983). Infrared absorption spectra have been obtained for some compounds trapped in crystalline solids by freezing liquid Xe, Kr, Ar, or CH_4 solutions. The optical quality of the solid solutions is good, and they have been cooled to $\sim 80\text{ K}$ in 1.35 cm sample thicknesses to study the absorption in fundamental vibrational bands of the solutes. In the cases discussed, the bands are narrow, with observed full widths at half-maximum absorbance $0.05\text{--}0.30\text{ cm}^{-1}$ greater than the instrumental resolution ($0.18\text{--}0.29\text{ cm}^{-1}$). The spectra appear

- to be free of 'multiple site' and solute aggregate absorptions. Spectra displaying isotropic splitting in bands of natural BCl_3 , SeF_6 , OsO_4 , TiCl_4 , and MoF_6 are presented, and band frequencies are compared with some results obtained in evaporative matrices, in the gas phase, and in liquid solutions. For this comparison the authors have obtained some spectra of SeF_6 and BCl_3 gas. (36 refs.)
- 77378 A structural interpretation of the vibrational spectra of binary fluorohafnate glasses.** R.M.Almeida (Centro de Física Molecular-Complexo I, Inst. Superior Tecnico, Lisboa, Portugal), J.D.Mackenzie. *J. Chem. Phys. (USA)*, vol.78, no.11, p.6502-11 (1 June 1983). Binary glass samples have been prepared in the $\text{HfF}_4\text{-BaF}_2$ system, containing between 62-73 mol.% HfF_4 . Their infrared absorption and polarized Raman spectra have been studied. The glass transition and crystallization temperatures have also been measured. The vibrational modes have been assigned and the results were compared with those previously obtained for $\text{ZrF}_4\text{-BaF}_2$ glasses. The cation isomorphous substitution of Zr by Hf allowed the authors to make a more definite vibrational assignment. The structures of the two glass systems were found to be similar, though not identical. The structural interpretation of the vibrational spectra was consistent with the occurrence of sixfold coordinated Hf atoms, probably forming a network of octahedral chains cross linked by Ba-F ionic bonds, with the degree of bridging increasing with the Hf content of the glasses. Substitution of Ba by Zr did not affect the structure. Due to the large F/Ba ratio of ~ 10 , there is an overlap of neighboring chains that may lead to sharing of a single nonbridging fluorine atom between two Hf atoms belonging to neighboring chains. The existence, on the average, of two such F-atoms for each Hf may raise its effective coordination number from 6 to ~ 8 , when determined from an X-ray radial distribution function analysis, as recent results show. Vibrational spectroscopy, however, appears to be able to effectively distinguish which is the parent Hf atom to which every fluorine is bonded by a predominantly covalent, directional and shorter bond, as part of a highly symmetric octahedral coordination shell. In this respect, vibrational spectroscopy (particularly Raman) appears to be a more sensitive structural tool than X-ray diffraction. (19 refs.)
- 77379 Infrared optical absorption due to one and two phonon processes in black phosphorus.** M.Ikezawa, Y.Kondo (Tohoku Univ., Sendai, Japan), I.Shiratori. *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1518-20 (May 1983). Using a single crystal of black phosphorus, anisotropic absorption spectra due to the two-phonon summation process have been found in the wavenumber region from 300 to 900 cm^{-1} . By an oblique incidence method, the dipole moment of an infrared active mode at 470 cm^{-1} has been confirmed to be in the z-direction of the crystal as predicted by Kaneta, Yoshida and Morita. Frequencies of unobserved A_u and B_{1u} modes are estimated to be about 420 and 250 cm^{-1} from the absorption spectra of the two-phonon process.
- 77380 Raman scattering by soft plasmon-LO phonon modes in ferroelectric semiconductors.** S.Katayama (Dept. of Phys., Osaka Univ., Toyonaka, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1829-37 (May 1983). Presents a theory of Raman scattering by the low-lying soft coupled plasmon-longitudinal optical (LO) phonon modes at low temperatures in semiconducting incipient ferroelectrics. The softening of this mode gives a dynamical intimation of the screened LO phonon instability induced by the dispersive ferroelectric phase transition. The calculations are compared with Raman spectra from $n\text{-KTaO}_3$ observed by Uwe et al. (1980), on the basis of the soft mode-like behavior of the coupled modes as well as of the simple energy band structure. (24 refs.)
- 77381 Infrared and Raman spectra of barium nitrite monohydrate.** O.P.Lamba, H.D.Bist (Dept. of Phys., Indian Inst. of Technol., Kanpur, India). *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.445-52 (1983). The low temperature infrared absorption and room temperature laser Raman spectra of polycrystalline $\text{Ba}(\text{NO}_2)_2\cdot\text{H}_2\text{O}$ and its deuterated analogue are studied. The strongly bonded H-atom of the water molecule makes a highly bent H-bond while the weakly bonded H-atom exhibits a slightly bent (or possible bifurcated) bond consistent with recent structural data; the H-bond enthalpies are estimated to be 3.3 and 2.1 Kcal/mole respectively. The wagging, twisting and rocking modes of the water molecule have been assigned using several well known criteria. The force constants of these modes have also been computed. The librational splittings observed at low temperature are consistent with polarization data, and are being attributed to infrared active factor group components. (26 refs.)
- 77382 Infrared absorption spectra of hydrogen complexes in type I diamonds.** G.S.Woods (CSO Valuations Ltd., London, England), A.T.Collins. *J. Phys. & Chem. Solids (GB)*, vol.44, no.5, p.471-5 (1983). The 3107 cm^{-1} peak has been observed in the infrared absorption spectra of all but one of some 50 type I diamonds examined. Evidence is presented which strongly supports the interpretation of this peak as being due to a carbon-hydrogen bond stretching mode. Reasons are given for believing that the hydrogen responsible for this, and the associated 1405 cm^{-1} line, is present as a constituent of the vinylidene group ($>\text{C}=\text{CH}_2$). Several new peaks, of fairly general occurrence, are reported in the wavenumber range 3400 cm^{-1} to 2750 cm^{-1} . Some of these lines, seen only when the specimens exhibit at least partial type Ib character, are almost certainly due to nitrogen-hydrogen bond stretching. Others, found in type Ia and/or partially type Ib specimens may be due to C-H or N-H stretching in different local environments. The observations show that hydrogen is as ubiquitous an impurity in diamond as nitrogen. Possible sites within the crystals for these hydrogenous groups are discussed. (21 refs.)
- 77383 Super-enhanced hyper-Raman scattering from dyes adsorbed on colloidal silver particles.** A.V.Baranov, Ya.S.Bobovich (S.I. Vavilov State Optics Inst., USSR). *JETP Lett. (USA)*, vol.36, no.8, p.339-43 (20 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.8, p.277-81 (20 Oct. 1982). [received: June 1983] Hyper-Raman-scattering spectra have been measured by the standard technique for the scattering from two rhodamine dyes and a crystalline violet dye adsorbed on silver. The extremely intense spectra found are attributed, in particular, to simultaneous resonances for one- and two-photon transitions. Various mechanisms for the process are discussed. The same effects are observed at the unshifted frequency. (7 refs.)
- 77384 Raman scattering spectra and structural properties of the chalcogenide glasses $\text{Sb}_2\text{As}_{1-x}\text{SI}_x$.** G.S.Svechnikov, M.Ya.Valakh, V.P.Pinzenik. *J. Appl. Spectrosc. (USSR)*, vol.36, no.5, p.566-9 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.796-800 (May 1982). [received: Feb. 1983] Presents the results of a study of the Raman scattering spectra of chalcogenide glasses of composition $\text{Sb}_2\text{As}_{1-x}\text{SI}_x$. The studies were carried out using a DFS-24 double spectrometer with a photon counting detection system. The

Raman spectra were excited by the emission of a He-Ne laser (632.8 nm). The spectra were detected in these experiments in the standard right angle geometry. All the measurements were carried out at a temperature $T=300\text{K}$. (12 refs.)

77385 Investigation of the temperature dependence of the dispersion of dielectric characteristics of lithium tantalate by the method of Raman scattering of light. N.S.Abdullov, V.S.Gorelik, B.S.Umarov. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.585-9 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.817-20 (May 1982). [received: Feb. 1983]

Investigates the temperature dependence of the low-frequency region of the RS spectrum of LiTaO_3 over the 300-928K temperature range. Also obtains the dispersion of the dielectric characteristics of this crystal over a wide temperature range. (7 refs.)

77386 Origin of the absorption bands of crystalline CsI in the CO_2 laser region. A.I.Mitichkin, A.N.Panova, L.V.Udovichenko, K.V.Shakhova.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.893-6 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.223-6 (Aug. 1982). [received: April 1983]

The authors have carried out a detailed analysis of the IR spectra obtained on a spectrophotometer at temperatures of 295 and 77K, using CsI crystals specially prepared by the Stockbarger technique with impurity ions CO_3^{2-} , CrO_4^{2-} , and SO_4^{2-} , which exhibit absorption bands near 1000 cm^{-1} . Only in the IR spectra of the $\text{CsI}(\text{CO}_3^{2-})$ crystals do they observe a very weak absorption band in the region of $\sim 940\text{ cm}^{-1}$ which always accompanied several bands which are not attributable to CO_3^{2-} absorption. Heat treatment of the $\text{CsI}(\text{CO}_3^{2-})$ crystals by heating or 30 min at 400°C followed by rapid cooling to room temperature resulted in an increase in the intensity of these bands and the appearance of a series of new absorption bands. (9 refs.)

77387 Spectra and structure of asymmetric carboxylic acid dimers in solution. N.S.Golubev, G.S.Denisov.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.930-6 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.265-72 (Aug. 1982). [received: April 1983]

The authors studied the infrared spectra of solutions containing mixtures of trifluoroacetic and trimethylacetic (pivalic) acids as well as several of their isotopically substituted species in pentane and hexadecane at concentrations from 10^{-3} to 10^{-1} mole/litre. The low temperature NMR spectra were recorded in a mixture of freons. The formation of a strong complex (asymmetric cyclic dimer) was noted in every case. The hydrogen bond and proton exchanges were examined. (22 refs.)

77388 Raman spectra and physical structure of cellulose triacetate. S.P.Firsov, R.G.Zhbankov.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.940-7 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.276-84 (Aug. 1982). [received: April 1983]

It is shown that the Raman spectra of cellulose acetates possess their own special features in the case of fibres and films and of uniaxially oriented and crystallised films. This reflects the characteristics of their physical structure, caused mainly by the specific ratio of the rotamers of the side groups. (19 refs.)

77389 Study of complexes of hydrogen halides with diethyl ether in aprotic solvents by the method of IR spectroscopy. A.A.Pankov, V.Yu.Borovkov, V.B.Kazanskii.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.953-7 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.291-5 (Aug. 1982). [received: April 1983]

The authors previously showed (see Dokl. Akad. Nauk SSSR, vol.258, p.902-6, 1980) that in the interaction of alcohols with hydrogen halides (HCl, HBr) in carbon tetrachloride and methylene chloride, together with complexes with the usual hydrogen bond with a 1:1 composition, complexes of an acid molecule with two alcohol molecules, in which a proton is transferred to the alcohol, are formed. In the present work, complex formation, in aprotic solvents of diethyl ether, which possesses a greater proton affinity than alcohols, with the same hydrogen halides was investigated by the method of IR spectroscopy. (10 refs.)

77390 Study of structure of copolymers of ethylene tetrasulfide and vinyl cyanide. I.T.Mladenov, M.K.Markov, D.D.Todorova.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.957-61 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.296-301 (Aug. 1982). [received: April 1983]

The authors studied the structure of the liquid copolymers of ethylene tetrasulfide and vinyl cyanide using infrared spectra. The possibility of vulcanizing these polymers at room temperature is examined. (11 refs.)

77391 Raman spectra and molecular orientation statistics for nematic liquid crystals. S.E.Yakovenko, V.I.Naumenko, A.A.Min'ko, N.M.Ksenofontova.

J. Appl. Spectrosc. (USA), vol.37, no.2, p.962-5 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.301-5 (Aug. 1982). [received: April 1983]

Various methods have been described for examining the orientation ordering in liquid crystals (LC). One method that gives the fullest information on the LC ordering is Raman spectroscopy. The authors examine the parameters of the orientation order derived from Raman spectra and birefringence measurements. The results are compared with model concepts on the mesomorphic state. (8 refs.)

77392 The interaction induced spectra of liquid CS_2 . A computer simulation study. P.A.Madden (Dept. of Theoretical Chem., Univ. of Cambridge, Cambridge, England), D.J.Tildesley.

Mol. Phys. (GB), vol.49, no.1, p.193-219 (May 1983). The spectral lineshapes corresponding to the symmetry forbidden spectra of CS_2 (the far infrared spectrum, and the infrared and Raman spectra of the g- and u-symmetry modes, respectively) were calculated from a computer simulation of the liquid at three state points. A multipole expansion was used to obtain the dependence of the interaction induced dipole moments and polarizabilities on the molecular coordinates. The intensities and shapes calculated for the lines are here compared with experimental data, the agreement is found to be good. Intermediate quantities calculated in the simulation are used to test the ideas which have been used in the theoretical description of the spectra, given by Madden and Cox (1981). Their assumptions are generally well supported by the calculations. (29 refs.)

77393 Optical phonons and structure of TlGaS_2 , TlGaSe_2 , and TlInS_2 layer single crystals. N.M.Gasany (Dept. of Phys., Azerbaidzhan State Univ., Baku, Azerbaijan SSR), A.F.Goncharov, N.N.Melnik, A.S.Ragimov, V.I.Tagirov.

Phys. Status Solidi b (Germany), vol.116, no.2, p.427-43 (1 April 1983). The polarization properties of bands in Raman scattering and IR reflection spectra are studied experimentally in TlGaS_2 , TlGaSe_2 , and TlInS_2 layer

single crystals and in solid solutions based on them. Additionally the angular dependence of IR-active modes on the angle between the phonon wave vector and the direction of the optical axis c of single crystals is investigated. It is shown that the observed phonon spectra can be interpreted on the basis of a primitive cell which contains two tetragonal-symmetry layers bonded to each other by an inversion operation. Bands corresponding to cells with a mixed composition are observed in the Raman spectra of the solid solutions. (26 refs.)

77394 Raman scattering from metal smokes. T.Nanba, T.P.Martin (Max-Planck-Inst. fur Festkörperforschung, Stuttgart, Germany).

Phys. Status Solidi a (Germany), vol.76, no.1, p.235-9 (16 March 1983). The effect of enhanced Raman scattering at metal surfaces was used to characterize the impurity layer on Ag and Cu smoke particles. The oxide layer seems to be composed of both MO and MO_2 having a disordered structure. Bands associated with graphitic carbon are also present. (14 refs.)

77395 Quantization of photo-excited carriers in GaAs doping superlattices. C.Zeller, B.Vinter, G.Abstreiter (Phys. Dept., Tech. Univ. München, Garching, Germany), K.Ploog.

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.729-31 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Photo-excited carriers in periodic doping multilayer structures of GaAs are studied using resonant inelastic light scattering techniques. Spin-flip single-particle intersubband excitations clearly demonstrate the quantization of electrons in purely space-charge induced potential wells. With increasing excitation intensity the electric subbands broaden to minibands with considerable dispersion with k perpendicular to the layers. A quasi-three-dimensional behavior is found in both self-consistent calculations and electronic Raman scattering experiments. (6 refs.)

77396 Distinction between 'free' CS_3^{2-} in ionic compounds and coordinated CS_3^{2-} in metallic complexes by the means of IR spectroscopy of solids. J.Roger, J.N.Pons, M.Stern (Univ. Pierre-et-Marie-Curie, Paris, France).

Rev. Chim. Miner. (France), vol.19, no.6, p.663-7 (1982). In French. The vibrations $\nu(\text{C-S})$ and $\nu_2(\text{C-S})$ appear well suited for the purpose. The splitting lies under 50 cm^{-1} with ionic compounds, from 100 to 160 cm^{-1} for Ni(II) or Co(III) trithiocarbonate complexes, near 200 cm^{-1} for covalent compounds like $(\text{C}_2\text{H}_5)_3\text{CS}_3$. (20 refs.)

77397 A comparison of the Raman spectra of ZnGa_2Se_4 and other gallium defect chalcopyrites. P.P.Lottici, C.Razzetti (Istituto di Fisica, Univ. di Parma, Parma, Italy).

Solid State Commun. (USA), vol.46, no.9, p.681-4 (June 1983).

The authors report and comment for the first time the Raman spectrum of ZnGa_2Se_4 . Looking for family trends they compare the present results with those obtained in other gallium defect chalcopyrites. The proportionality law between the frequencies of corresponding phonons in different compounds is verified for all the modes with the exception of the lowest energy polar modes. Evidence of the peculiarity of these modes is obtained, confirming that reported for $\text{Zn}_x\text{Cd}_{1-x}\text{Ga}_2\text{S}_4$ pseudoternary compounds. (8 refs.)

77398 Reflection of light from a two-phase metal-insulator system. I.A.Vasserman, V.V.Ganin, Yu.G.Zaretskii, A.D.Kurbatov, A.D.Fistul', A.Ya.Shik, Yu.V.Shmartshev (A.F. Ioffe Physicotechn. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1919-21 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3377-80 (Nov. 1982). [received: May 1983]

An investigation was made of the reflection spectra of finely dispersed W+LiInO_3 mixtures with different proportions of the components. It was found that when the concentration of W was between 20 and 80 vol.%, the samples exhibited a metallic conduction, but the reflection spectrum was typical of an insulator. The effect is explained using the percolation theory. (10 refs.)

77399 Raman light scattering in semiconductors containing dislocations. V.I.Belyavskii, V.V.Sviridov (Polytech. Inst. Voronezh, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1987-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3490-2 (Nov. 1982). [received: May 1983]

Raman scattering is one of the most direct methods for investigating the electron-phonon interaction which may play an important role in the formation of the dislocation energy bands. The authors calculate the Raman spectrum using a general theory of the secondary radiation emitted by semiconductors developed for the Raman scattering case allowing for the presence of bulk excitons and longitudinal optical phonons. The interaction of dislocation excitons with light can be considered in the dipole approximation, i.e. the wave vectors of phonons can be ignored compared with the quasimomenta K of dislocation excitations. (9 refs.)

77400 Nonequilibrium phonons in ZnSe single crystals. V.A.Korneichuk (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1992-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3496-9 (Nov. 1982). [received: May 1983]

Reports an investigation of the Raman scattering spectra of ZnSe at high rates of two-photon excitation. The results are used to extract the effective temperature of both TO phonons and LO phonons. It is shown that in the case of polar semiconductors with a parabolic conduction band, the main mechanism of hot carrier thermalisation is scattering by LO phonons. (7 refs.)

77401 The Brownian rotational motion and shape of IR-absorption lines. E.N.Ivanov, E.N.Shermatov.

Ukr. Fiz. Zh. (USSR), vol.28, no.5, p.667-71 (May 1983). In Russian. The model of Brownian inertial rotation, earlier suggested by one of the authors, has been used to develop the theory of shape and width for IR molecule absorption lines in condensed media. The line width is discussed as a function of parameters characteristic of the Brownian rotation. (13 refs.)

77402 Raman spectroscopy for characterization of annealing of ion-implanted InP. D.R.Myers, P.L.Gourley (Sandia Nat. Labs., Albuquerque, NM, USA), K.V.Vaidyanathan, H.L.Dunlap.

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.635-40. Raman spectroscopy has been used as a noncontacting, nondestructive tool to evaluate the properties of Si^{3+} - and Be^{2+} -implanted InP samples annealed at temperatures ranging from 600 to 750°C using phosphosilicate glass (PSG) as the encapsulant. Carrier activation, carrier mobility and recovery of damage as a function of anneal temperature obtained from analysis of Raman data agree very well with independent electrical measurements. 78.35 BRILLOUIN AND RAYLEIGH SCATTERING

- 77403 Determination of the ratios K_{11}/K_{22} and γ_1/K_{11} in nematic liquid crystals by correlation spectroscopy. S.A.Ivanov, V.Yu.Vetrov. *J. Appl. Spectrosc. (USA)*, vol.37, no.2, p.975-7 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.316-19 (Aug. 1982). [received: April 1983]
- The authors have demonstrated the use of correlation spectroscopy for the determination of the ratios of elastic constants K_{11}/K_{22} and the viscoelastic ratios η_1/K_{11} and γ_1/K_{11} . The simplicity and precision of the determination of these ratios suggests that this method is promising for the study of the viscosity and elastic properties of nematic liquid crystals. (7 refs.)
- 77404 Acoustic phonon absorption and dispersion in hydroxyl-doped KCl crystals at low temperatures [Brillouin scattering]. J.F.Berret, J.Pelous, R.Vacher (Lab. de Spectrometrie Rayleigh-Brillouin, Univ. des Sci. et Tech. du Languedoc, Montpellier, France). *J. Phys. Lett. (France)*, vol.44, no.11, p.433-41 (1 June 1983).
- The acoustic properties of hydroxyl-doped KCl crystals have been measured by Brillouin scattering in the temperature range 1 to 50K. For samples with OH^- content higher than 200 ppm, two features dominate the temperature dependence of the attenuation, namely an absorption peak around 20K and a strong increase of the damping with decreasing temperature below 5K. The results bear some similarities to the behaviour observed in glasses and have been accounted for by assuming relaxational and resonant phonon absorption processes. (24 refs.)
- 77405 Integrated scattering of light in lead magnoniobate, which is a ferroelectric with a diffuse phase transition. N.N.Krainik, V.A.Trepakov (A.F.Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys-Solid State (USA)*, vol.24, no.11, p.1942-5 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3419-25 (Nov. 1982). [received: May 1983]
- Above the average Curie temperature there were no significant changes in the size of the scatterers responsible for the temperature-dependent component of the integrated scattering of light observed right up to 360°C. There were

slight anomalies in the scattering at temperatures $\sim 100\text{-}160^\circ\text{C}$ and the maximum of the depolarized components in the region of $\sim 80^\circ\text{C}$. The results obtained were analyzed on the assumption of fluctuations of the composition with a partial ordering of the octahedral ions. (30 refs.)

78.40 VISIBLE AND ULTRAVIOLET SPECTRA

- 77406 Fundamental optical absorption and valence bands in alkali silver halide crystals. K.Edamatsu, M.Ikezawa, K.Sato, S.Kono, T.Sagawa (Dept. of Phys., Tohoku Univ., Sendai, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1521-4 (May 1983).
- Anisotropic fundamental optical absorption bands have been found at 4.4 eV in K_2AgI and Rb_2AgI , and at 4.9 eV in Rb_2AgBr_3 . The X-ray photoelectron spectrum of Rb_2AgI indicates that the uppermost valence band is the p-band of halogen. Optical absorption spectra are interpreted in terms of transitions of the charge transfer type from the halogen to the silver ion. The photo-excitation in the fundamental absorption region have been observed to induce luminescence and a radiation damage effect at low temperature.
- 77407 Vacuum ultraviolet reflectance spectra and band structures of pyrites (FeS_2 , CoS_2 and NiS_2) and NiO measured with synchrotron radiation. S.Suga, K.Inoue, M.Taniguchi, S.Shin, M.Seki (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan), K.Sato, T.Teranishi. *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1848-56 (May 1983).
- Reflectance spectra of FeS_2 , CoS_2 , and NiS_2 pyrites have been measured in the photon energy region from 4 to 30 eV with synchrotron radiation and compared with the results of NiO and related compounds. Dielectric constants, optical constants, effective electron numbers as well as energy-loss functions are evaluated by means of the Kramers-Kronig analysis. Fine structures of the reflectance spectra are qualitatively interpreted providing information on band structures. Characteristic features of band structures related to the 3d electrons in the low-spin state are experimentally elucidated.
- 77408 Temperature dependence of optical absorption near the order-disorder phase transition of sodium nitrate. R.Kawashima, K.Suzuki (Dept. of Appl. Material Sci., Muroran Inst. of Technol., Muroran, Japan). *J. Phys. Soc. Jpn. (Japan)*, vol.52, no.5, p.1857-65 (May 1983).
- The optical absorption spectrum of sodium nitrate, NaNO_3 , has been measured for the wavelength range from 6000 Å to 2000 Å at temperatures between 49.5°C and 298.6°C. The optical absorption of the two absorption bands shows anomalous temperature dependence near the order-disorder phase transition of NaNO_3 . The phenomenological relation between the energy gaps and the heat capacity has been confirmed. Low energy tails of the two absorption bands have shifted to lower energy side with increasing temperature, and they have been found to obey the Urbach rule within experimental error. (26 refs.)
- 77409 Induced absorption in Icelandic spar crystals under ultraviolet illumination. E.V.Kas'yanenko, O.P.Matveeva, A.V.Skropyshev. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.572-4 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.803-5 (May 1982). [received: Feb. 1983]
- Studies the peculiarities of the variation in the optical properties of rose Icelandic spar when it is exposed to UV illumination. The measurements were carried out on single crystals of $\text{CaCO}_3 \cdot \text{Pb}^{2+}$ containing lead concentrations in the range 0.01-0.2%. The absorption and excitation spectra were recorded on a Beckman spectrophotometer over the wavelength range 200-800 nm, while the emission spectra were recorded on a CDL-1 spectrometer. (7 refs.)
- 77410 Reflectance and thermorefectance spectra and energy band structure of GeSe crystals. G.Valiukonis (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, Lithuanian SSR), F.M.Gashimzade, D.A.Guseinova, G.Krivaite, A.M.Kulibekov, G.S.Orudzhev, A.Sileika. *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.81-92 (1 May 1983).
- The reflectance spectra of orthorhombic GeSe crystals are studied in the region 0.5 to 12 eV in polarized light with $\text{E}||\text{a}$ and $\text{E}||\text{b}$ at 290K and a Kramers-Kronig analysis is performed. The thermorefectance spectra are investigated in the region 1 to 5 eV for $\text{E}||\text{a}$ and $\text{E}||\text{b}$ at 300 and 90K. The energy band structure calculations of GeSe are carried out using the pseudopotential method, and the spectra of the imaginary part of the dielectric constant are calculated by the $\mathbf{k} \cdot \mathbf{p}$ method. A classification and interpretation of main structures of optical spectra of GeSe by direct interband transitions at critical points Γ , U, T and high symmetry lines B' , V, A is presented on the basis of calculated band structure and selection rules for optical dipole transitions of orthorhombic $\text{A}''\text{B}^0$ crystals. (25 refs.)
- 77411 Infrared photomodulation of the band edge transmission in semi-insulating GaAs. J.Bonnafant, M.de Murcia, M.Castagne, J.P.Fillard (Centre d'Electronique de Montpellier, Univ. des Sci. et Tech. du Languedoc, Montpellier, France). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.K147-50 (16 April 1983).
- The authors describe the observation of a photo-induced modulation effect in the band edge transmission in GaAs and its possible explanations. The transmission spectrum is measured with a low intensity monochromatic light beam. Infrared illumination is provided by a chopped YAG:Nd CW laser (400 mW) and an optical guide. (5 refs.)
- 77412 Effect of pressure on the absorption spectra of solid O_2 . A.F.Prikhot'ko, Yu.G.Pikus, A.I.Shanskii. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.4, p.615-717 (April 1983). In Russian.
- Spectral methods were used to investigate the dependence of the $\beta \rightarrow \alpha$ transformation in solid O_2 crystals on pressure. It is shown that the observed phenomenon is mainly characterised by the strengthening of the exchange interactions during the compression of O_2 . (9 refs.) V.G.P.
- 77413 Reflectivity spectra of Sb_2S_3 , Sb_2Se_3 , Bi_2S_3 . V.V.Sobolev, V.M.Kramar', E.F.Zagaynov. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.783-4 (May 1983). In Russian.
- Investigates the reflectivity spectra of cleaved Sb_2S_3 , Sb_2Se_3 and Bi_2S_3 monocrystals in polarized light $\text{E}||\text{c}$, $\text{E}||\text{a}$ at 80 and 293K in the region 1 to 4.8 eV. Each spectrum was found to contain 13-18 maxima. The electronic structures and transition polarisations have been calculated. (5 refs.) V.G.P.

77414 Radiation generation by collective phenomena in semiconductors. E.Gornik, R.A.Hopfel (Inst. für Experimentalphys., Univ. Innsbruck, Innsbruck, Austria). *Arch. Elektron. & Übertragungstechn. (Germany)*, vol.37, no.5-6, p.213-16 (May-June 1983).
The properties of two-dimensional plasma oscillations at present in surface inversion layers are discussed. The excitation spectrum is calculated using Bose-Einstein statistics. The mechanism of the coupling between the nonradiative plasma waves and the radiation field via a periodic grating in the nearfield of the inversion layer is described. Possibilities for generating coherent light in a semiconductor with this principle are discussed. (9 refs.)

77415 Fluorescence of molecular crystals at high levels of optical pumping. V.Kh.Brikenshtein (Inst. of Biological Testing of Chem. Compounds, Acad. of Sci., Chernogolovka, USSR), V.A.Benderskii, P.G.Filippov. *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.9-39 (1 May 1983).
The authors cover the published data on phenomena occurring in molecular crystals under conditions of high-power optical pumping. Some of them, e.g. stimulated emission and nonlinear fluorescence quenching (NFQ) have been studied extensively and utilized for scientific purposes in the study of other effects in molecular crystals. Thus, the stimulated emission of impurities have been used as a method for the determination of vibronic relaxation times in the ground state. NFQ proves to be a common phenomenon for all molecular crystals and solutions. An understanding of this phenomenon enables calculations to be made of rate constants and their temperature dependence for the recombination and energy transfer processes. Research into other related processes is at the beginning. (131 refs.)

78.50 IMPURITY AND DEFECT ABSORPTION IN SOLIDS

77416 Photoinduced absorption spectra of ZnS:Fe crystals. H.Zimmermann, R.Boyn, N.Nagel (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.229-39 (1 May 1983).
Photoinduced absorption (PA) spectra of ZnS:Fe crystals are measured between 0.3 and 3.6 eV by means of a modulation technique. Transitions related to the charge states Fe^{3+} and Fe^{2+} , which have been detected by EPR a long time ago, are believed to be seen in these spectra. In particular, the processes $\text{Fe}^{3+} \rightarrow \text{Fe}^{2+} + h$ and $\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + e$ are identified, the latter manifesting itself most clearly in the excitation spectrum of the PA band due to the former transition. The shapes of the photoneutralization and photoionization spectra are discussed, and the position of the Fe^{2+} ground state in the forbidden gap is estimated. (23 refs.)

77417 Model for optical absorption in transition metals containing d impurities. J.C.Parlebans (Lab. de Magnetisme et de Structure Electronique des Solides, Univ. Louis Pasteur, Strasbourg, France). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.255-9 (1 May 1983).
The effect of a 'd' impurity is investigated on the contribution to the optical absorption in a transition metal from electronic intra- and interband transitions. Within a tight-binding approximation a previous calculation of the imaginary part $\epsilon_2(\omega)$ of the dielectric constant in simple models is extended to realistic multiband dilute alloys. The possibility is shown of exploring critical points in nickel host band structure, for example by wave-vector non-conserving transitions induced by impurities, in relation with recent experimental data. (11 refs.)

77418 Fluctuations in light transmission of zinc sulphide. J.M.Noras (Dept. of Phys., Univ. of Bradford, Bradford, England). *Phys. Status Solidi b (Germany)*, vol.76, no.1, p.K53-6 (16 March 1983).
Samples of melt-grown polycrystalline ZnS have been studied by optical absorption. At temperatures near 6K, under steady illumination by white light the authors have observed a quasi-periodic fluctuation in the intensity of transmitted light. The modulation was of the order of 10% of the maximum transmission and the period some 30 min. (4 refs.)

77419 Optical properties of the $\text{Tl}^0(1)$ center in KCl . L.F.Mollenauer, N.D.Vieira, L.Szeto (Bell Telephone Lab., Holmdel, NJ, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5332-46 (1 May 1983).
The authors report both experimental and theoretical studies of the $\text{Tl}^0(1)$ center in KCl , a center consisting of a neutral Tl atom perturbed by the field of an adjacent anion vacancy. Absorption bands peaking at 1040, 720, 550, and 340 nm were all shown to belong to the $\text{Tl}^0(1)$ center. The relatively weak ($f \approx 0.01$) bands at 1040 and 720 nm correspond to absorptions terminating on the crystal-field-split components of the $6^2P_{3/2}$ level, while the stronger band at 550 nm corresponds to transition to a state derived largely from $7^2S_{1/2}$. The sole luminescence band is the laser-active band having 1.6- μsec decay time and peaking at 1520 nm. The model presented here can account for the transition energies of the 6p manifold, including the Stokes shift between absorption (at 1040 nm) and luminescence, as well as the polarization properties and relative oscillator strengths of the 1040-, 720-, and 550-nm bands. (11 refs.)

77420 Valence-band splitting of SrTiO_3 . K.W.Blazey, M.Aguilar, J.G.Bednorz, K.A.Muller (IBM Zurich Res. Lab., Ruschlikon, Switzerland). *Phys. Rev. B (USA)*, vol.27, no.9, p.5836-8 (1 May 1983).
Optical charge-transfer transitions from the oxygen valence bands to Fe^{5+} and V^{5+} impurity states at Ti^{4+} sites in SrTiO_3 reveal a 0.42-eV valence-band splitting. Since these transitions are observed with conventional optical-absorption spectroscopy, their resolution is far better than previously obtained by photoelectron spectroscopy. (9 refs.)

78.55 PHOTOLUMINESCENCE

77421 Luminescent properties of terbium-activated lanthanum oxysulfide. Guo Fengyu, Huang Zhupo (Dept. of Chem., Peking Univ., Peking, China). *Acta Sci. Nat. Univ. Pekin. (China)*, no.5, p.81-5 (1982). In Chinese.
Lanthanum oxysulfide samples activated by terbium (with the mole ratio of Tb to La $\sim 5 \times 10^{-3}$ - 7×10^{-2}) were prepared by sulphidizing the mixed oxides of lanthanum and terbium at high temperature. The luminescent properties of these samples under the excitation of UV light, cathode-ray and X-ray were investigated. In all three cases, the phosphor's brightness increases with the terbium concentration, and comes up to a maximum at the terbium content about 5×10^{-3} . The cathode-ray luminescence efficiency of $\text{La}_2\text{O}_3\text{:Tb}$ (4×10^{-3}) may reach 62.8 Lumen/Watt. The emission spectra of UV-, CR- and X-ray-excited luminescence of all $\text{La}_2\text{O}_3\text{:Tb}$ samples are quite similar. The peaks of 489, 545, 587 and 620 nm stem from $^3\text{D}_4 \rightarrow ^3\text{F}_6$, $^3\text{D}_4 \rightarrow ^3\text{F}_5$, $^3\text{D}_4 \rightarrow ^3\text{F}_4$ and $^3\text{D}_4 \rightarrow ^3\text{F}_3$ transitions of Tb^{3+} ion respectively. The relative intensities of these 4 peaks remain unchanged within the concentration range of terbium studied. Therefore the values of colour indices of all these samples are about the same. (4 refs.)

77422 Quantum fluctuations and their role in applied roentgenoluminescence. A.M.Gurvich (Moscow Sci. Res. Roentgenoradiological Inst., Moscow, USSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.128-33 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.964-9 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).
The results of measurements of granularity performed by R.V. Katomina on photographs obtained from screens made of CaWO_4 luminophor of two types are given. As the luminophor load decreases and a corresponding growth occurs in the contrast transmission factor K , the granularity of the image characterized by the negative logarithm of the threshold brightness B_{tr} (at which this granularity on the photograph becomes noticeable) also increases. In order to express the dependence of the noise on the FCC (frequency contrast characteristic), the concept of the effective width of the spatial pass-band is introduced. It is set equal to the space frequency ν_{ex} at which K decreases by a factor of e. Since $\delta_s \sim 1/\sqrt{\Omega}$, (Ω is the area of the considered image element), it follows that assuming $\Omega = (1/2\nu_{ex})^2$, the authors find $\delta_s \sim \nu_{ex}/\sqrt{\eta K}$. The quantity $\nu_{ex}/\sqrt{\eta K}$ may be called the screen index of the quantum granularity. In roentgenoscopy (visual observation of the image on the screen) the noise level is in addition proportional to $\sqrt{\nu_{el}}$, where ν_{el} is the temporal frequency at which K decreases by a factor of e. (22 refs.)

77423 Intensities of $f-f$ transitions in the luminescence of ionic crystals activated by rare-earth elements. A.A.Kaminskii, B.Z.Malkin, L.A.Bumagina (V.I. Lenin Kazan State Univ., Kazan, USSR). *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.5, p.144-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.5, p.979-84 (1982). [received: May 1983] (Proceedings of the All-Union Conference on Luminescence Commemorating the Ninetieth Anniversary of the Birth of the Academician S.I. Vavilov, Leningrad, USSR, 21-24 April 1981).
The electric dipole moments between the energy levels of the $4f^n$ -shell of free rare-earth (RE) ions are parity-forbidden. In a crystal this forbiddenness may be removed if the point symmetry group of the RE-ion does not contain the inversion operation. Two principal mechanisms which are responsible for the intense radiative $f-f$ transitions in dielectric matrices may be isolated: the Judd-Ofelt mechanism, within the framework of which the electric dipole transitions become allowed as a consequence of the mixing of different-parity states of the odd component of the crystal field (CF), and the dynamic-polarization mechanism in which $f-f$ transitions are stimulated by the variable component of the even CF modulated by the radiation field. In both cases the problem of analyzing the intensities of the transitions can be reduced to calculating the CF parameters and the structure of the local high-frequency electric field induced by the electromagnetic wave at the location of the

luminescence center. The authors have solved this problem for yttrium-aluminum garnet activated by Nd^{3+} ions. (8 refs.)

77424 Low-temperature luminescence in Eu^{3+} -doped tunstates of the perovskite stacking-variant type. G.Blasse (Phys. Lab., Utrecht Univ., Utrecht, Netherlands), S.Kemmler-Sack.
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.4, p.352-5 (April 1983).
The photoluminescence at low temperatures of Eu^{3+} -activated tungstates of the perovskite stacking-variant type are reported. The main examples were $\text{Ba}_2\text{La}_{1-x}\text{Eu}_x\text{W}_2\text{O}_{12}$ (12 layer) and $\text{Ba}_2\text{Y}_{1-x}\text{Eu}_x\text{W}_2\text{O}_{18}$ (18 layer). The luminescence of 12 and 18 layer compounds were strikingly different. Not only were the emission and absorption spectra of the Eu^{3+} ions different, but also the energy transfer processes were not the same. (22 refs.)

77425 Phosphorescent lifetime and quantum yield measurements of $\text{K}_4\text{Pt}_2(\text{H}_2\text{P}_2\text{O}_5)_4$ from 1.6 to 300K. J.T.Markert, D.P.Clements, M.R.Corsen, J.K.Nagle (Bowdoin Coll., Brunswick, ME, USA).
Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.175-9 (13 May 1983).
Phosphorescent lifetime measurements were performed on $\text{K}_4\text{Pt}_2(\text{H}_2\text{P}_2\text{O}_5)_4$ in 2/1 ethylene glycol/water solution, as well as on green and brown crystalline forms, from 1.6 to 300K. Quantum yield measurements on $\text{K}_4\text{Pt}_2(\text{H}_2\text{P}_2\text{O}_5)_4$ in solution were performed over the same temperature range. Data for the dissolved sample were fit to yield a 41.8 cm^{-1} energy splitting of the assumed $^3A_{2u}$ excited term into E_u ($\tau=4.2 \mu\text{s}$) and A_{1u} ($\tau=6.06 \text{ ms}$) components. The quantum yield for this sample varied from 0.13 at 4.2K to 0.43 at 77K. The green and brown crystalline forms showed similar behavior, with somewhat shorter lifetimes. A purple crystalline form showed no detectable luminescence from 1.6 to 300K. (12 refs.)

77426 Spectroscopic properties of $\text{TbP}_2\text{O}_{14}$, $\text{TbLiP}_2\text{O}_{12}$, and $\text{TbAl}_3(\text{BO}_3)_4$. W.K.Zwicker, S.Colak, J.Khurgin (Philips Labs., Briarcliff Manor, NY, USA), J.M.Robertson.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.5-9 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).
Stoichiometric crystals of $\text{TbP}_2\text{O}_{14}$, $\text{TbLiP}_2\text{O}_{12}$, and $\text{TbAl}_3(\text{BO}_3)_4$ were obtained by fluxed growth techniques. The emission spectra of various transitions of Tb^{3+} in these crystals were obtained at different temperatures. The fluorescence lifetimes of 3D_4 states were measured at various temperatures. The emission cross sections of $^3D_4 \rightarrow ^7F_5$ transition are reported. (19 refs.)

77427 Theoretical calculations of fluorescent branching ratios for $\text{YAlO}_3:\text{Er}^{3+}$ from the complete Judd-Ofelt theory. K.K.Deb (US Army Night Vision & Electro-Optics Lab., Fort Belvoir, VA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.335, p.31-5 (1982). [received: May 1983] (Advanced Laser Technology and Applications, Arlington, VA, USA, 6-7 May 1982).
The optical properties of the Er^{3+} ion in yttrium orthoaluminate (YAlO_3) are analyzed with a crystal-field Hamiltonian of C_3 symmetry. Starting with the best-fit crystal field parameters, B_{eff} , the crystal field splitting schemes, the Judd-Ofelt intensity parameters, and multiplet-to-multiplet and line-to-line fluorescence branching ratios for Er^{3+} in YAlO_3 have been predicted. The calculated energy levels and the Judd-Ofelt intensity parameters compare reasonably well with available experimental data. It is suggested that the present theory predicts the correct order of line-to-line intensities for the laser transitions emanating from the $^3S_{3/2}$ manifold to 1I_1 channels of Er^{3+} in YAlO_3 . (24 refs.)

77428 Spectroscopic properties of triplet excited polyvinylcarbazoles and vinylcarbazole copolymers. A.Kal'nitskii, O.M.Faidish, O.V.Mavrenik.
Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.1, p.55-8 (1983). In Ukrainian.
A difference is found between a temperature dependence of phosphorescence for homopolymer polyvinylcarbazole and that for 9-vinylcarbazole copolymers with methylmethacrylate. In copolymers the transition from 4.2K to 77K does not influence phosphorescence very much whereas in the homopolymer such a transition causes a marked decrease in the intensity and appearance of an almost structureless band. The observed phenomena are due to detrapping of excitations from traps, migration and annihilation of unidimensional excitons as well as to triplet excimer formation. (9 refs.)

77429 Temperature dependence of the relaxation decay time and the integrated intensity of the photoluminescence from the magnetic semiconductor CdCr_2Se_4 . S.S.Yao, R.R.Alfano (Dept. of Phys., City Coll. of New York, New York, NY, USA), W.J.Miniscalco.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.4, p.111-13 (April 1983).
The photoluminescence relaxation decay time of the band-to-band transition in CdCr_2Se_4 was measured from 4 to 250K. The decay time was measured to be $\sim 45 \text{ ps}$ at 4K, which monotonically decreased to $< 10 \text{ ps}$ at 250K. The integrated intensity of the steady-state photoluminescence from CdCr_2Se_4 was measured from 15 to 220K. The steady-state intensity increased as the temperature decreased, and increased quadratically with the excitation intensity. The temperature dependence of the relaxation decay time is theoretically fitted to the temperature dependence of the steady-state integrated intensity. (5 refs.)

77430 Quantum efficiency of alexandrite. M.L.Shand (Corporate Res. & Dev., Allied Corp., Morristown, NJ, USA).
J. Appl. Phys. (USA), vol.54, no.5, p.2602-4 (May 1983).
The first measurement of the radiative quantum efficiency (QE) of alexandrite has been determined using a photoacoustic (PA) technique which depends on the phase of the PA signal as a function of chopping frequency. The measured QE = 0.95 ± 0.05 . (7 refs.)

77431 Photoluminescence of molecular beam epitaxially grown Ge-doped GaAs. M.Baffleur, A.Munoz-Yague (Lab. d'Automatique et d'Analyse des Systemes, CNRS, Toulouse, France), J.L.Castano, J.Piqueras.
J. Appl. Phys. (USA), vol.54, no.5, p.2630-4 (May 1983).
The role played by molecular beam epitaxial growth conditions in Ge-doped GaAs and the introduction of deep levels inside the forbidden gap were investigated by means of photoluminescence. Firstly, a qualitative correlation was established between the compensation ratio obtained from Hall measurements and the ratio between the integrated intensity of the conduction band-acceptor transition to that of the donor-valence band. Secondly, two peaks at 1.41 and 1.45 eV, very similar to those introduced by another amphoteric impurity (Si) and systematically found in nearly all the samples, were studied in order to clarify their origin. Ge_{As} appears to be involved in both cases. The intensity of the 1.45 eV line increases with growth temperature which agrees with the assignment to a $\text{Ge}_{\text{As}}-\text{V}_{\text{As}}$ complex already suggested elsewhere. Conversely, the emission intensity at 1.41 eV decreases strongly with increasing growth temperature and the presence of $\text{Ge}_{\text{As}}-\text{As}_i$ and/or $\text{Ge}_{\text{As}}-\text{As}_{\text{Ga}}$ complexes is suggested to explain this result. (15 refs.)

77432 Photoluminescent and electrical properties of InGaPAs mixed crystals liquid-phase-epitaxially grown on (100) GaAs. S.Mukai (Electrotech. Lab., Ibaraki, Japan).
J. Appl. Phys. (USA), vol.54, no.5, p.2635-45 (May 1983).
The liquid-phase-epitaxial growth of InGaPAs layers on (100) GaAs is described for growth temperatures of 785 and 815°C. Photoluminescence (PL) spectra and electron Hall mobility of the layers are investigated as a function of crystal composition. The width of PL spectra measured at 300K is 40 meV, approximately the same value as that of GaAs, when the energy gap E_g of the layers is 1.9 eV or lower than 1.6 eV. The spectral width is around 80 meV when the energy gap of the layers is around 1.75 eV. The increase in the spectral width is attributed to variation of the local energy gap from analysis of dependence of the PL spectra on temperature and on excitation intensity. The indication that local energy gap varies in layers with E_g around 1.75 eV is consistent with the composition dependence of electron mobility. The mobility shows a sharp dip down to $1000 \text{ cm}^2/\text{Vs}$ around this composition, while it depends on composition only slightly for layers with E_g lower than 1.6 eV. The dip in composition dependence is attributed to space-charge scattering from analysis of temperature dependence of mobility. X-ray diffraction spectrum and surface morphology are also reported. The width of X-ray diffraction spectra is large for layers with E_g around 1.75 eV. This indicates that the local lattice constant varies significantly. Thick and uniform layers are particularly difficult to grow for such composition. These composition dependences of PL spectra, X-ray diffraction, and surface morphology are more significant in layers grown at 785°C than in layers grown at 815°C. The local variation of energy gap and lattice constant is attributed to variation of local composition caused by immiscibility of InGaPAs. (31 refs.)

77433 Time characteristics of secondary emissions in ZnTe under band-to-band excitation. T.Kushida, S.Kinoshita, F.Ueno, T.Ohtsuki (Dept. of Phys., Osaka Univ., Osaka, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.5, p.1838-47 (May 1983).
Transient behavior of secondary emission intensity has been measured near the fundamental absorption edge of ZnTe by means of a time-correlated single photon counting method under the excitation by subnanosecond light pulses from a CW mode-locked Ar^{+} ion laser. The obtained time responses of bound-exciton luminescence lines, exciton-polariton luminescence bands and a Raman-like $2LO$ line are analyzed. The dynamics of excitonic polaritons derived from the result are compared with a theoretical calculation, and the mechanisms of the appearance of the Raman-like LO lines and the polariton luminescence bands are discussed. (28 refs.)

77434 Time resolved stimulated fluorescence spectrum of the uranyl ion in the mineral metaautunite. L.V.Haley, J.A.Koningsstein (Ottawa-Carleton Inst. for Res. & Graduate Studies in Chem., Carleton Univ., Ottawa, Ontario, Canada).
J. Phys. & Chem. Solids (GB), vol.44, no.5, p.431-3 (1983).
The time resolved stimulated emission spectrum of the uranyl ion of the mineral metaautunite $\text{Ca}(\text{UO}_2)_2(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ is reported. The rise and decay time of this fluorescence is interpreted in terms of a simple model, proposed earlier by Lessing et al. (1970) and Flemming et al. (1977). (6 refs.)

77435 Ultrafast vibrational relaxation and hot luminescence of Ti^{+} centers in KI. G.S.Zavt, V.G.Plekhanov, V.V.Khizhnyakov, V.V.Shepelev (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).
JETP Lett. (USA), vol.36, no.7, p.288-91 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.235-8 (5 Oct. 1982). [received: May 1983]
Hot luminescence bands are observed in KI-Ti crystals. These bands are interpreted as emission from the first classical turning point in the process relaxation of the configurational coordinate, which represents a complex non-Markovian process with scale time $\sim 0.5 \text{ ps}$. (8 refs.)

77436 Electron-hole liquid in indium antimonide in a strong magnetic field. I.V.Kavetskaya, Ya.Ya.Kost', N.N.Sibeldin, V.A.Tsvetkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
JETP Lett. (USA), vol.36, no.7, p.311-14 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.7, p.254-6 (5 Oct. 1982). [received: May 1983]
A new emission band which is related to decomposition of the electron-hole liquid (EHL) stabilized by a magnetic field, is observed in the magnetophotoluminescence spectra of pure indium antimonide crystals at high levels of excitation. (4 refs.)

77437 Luminescence in gadoliniumchlorotungstate (GdWO_4Cl). G.Blasse (Phys. Lab., State Univ., Utrecht, Netherlands), L.H.Brixner.
J. Solid State Chem. (USA), vol.47, no.3, p.368-72 (May 1983).
The luminescence of GdWO_4Cl , EuWO_4Cl , and $\text{GdWO}_4\text{Cl}:\text{Eu}^{3+}$ is reported. The tetrahedral tungstate group in these compounds luminesces similarly to those in other host lattices. The Gd^{3+} ions form a luminescent system which is not connected to the tungstate groups. The Gd^{3+} system transfers the greater part of its energy to defective tungstate groups in GdWO_4Cl and to Eu^{3+} in $\text{GdWO}_4\text{Cl}:\text{Eu}^{3+}$. (11 refs.)

77438 Physicochemical and spectral luminescence properties of a glass based on the $\text{SiO}_2-\text{Al}_2\text{O}_3-\text{La}_2\text{O}_3-\text{Nd}_2\text{O}_3$ system. G.E.Malashkevich, V.N.Tadeush, V.V.Kuznetsova, Kh.A.Charches, N.I.Bliznyuk, V.G.Mikhalevich, M.B.Rzhevskii.
J. Appl. Spectrosc. (USA), vol.37, no.2, p.926-9 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.261-5 (Aug. 1982). [received: April 1983]

The results of work on the synthesis and investigation of certain physicochemical and spectral luminescence properties of a glass with a high concentration of rare earth ions are presented. The physicochemical properties studied were density, Young's modulus, Poisson coefficient, shear modulus, thermal conductivity, microhardness, linear thermal expansion coefficient and X-ray phase analysis. The concentration dependence of the luminescence quantum yield for Nd^{3+} ions when La^{3+} ions are replaced by them was examined. (5 refs.)

77439 A theoretical study of the effects of inhomogeneous level broadening on the spectral kinetic characteristics of the delayed emission from solid polar solutions of complex compounds. S.K.Gorbatsevich, I.M.Gulis, A.I.Komyak.
J. Appl. Spectrosc. (USA), vol.37, no.2, p.968-74 (Aug. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.2, p.309-16 (Aug. 1982). [received: April 1983]
The present study is a theoretical continuation of the authors previous work (see *ibid.*, vol.37, no.1, p.92, 1982) in which it was shown by experiment that under conditions of inhomogeneous broadening there is a considerable dependence on the excitation frequency for the spectral and kinetic characteristics of the delayed fluorescence and phosphorescence, and this applies also to the emission spectrum in pulse excitation. (10 refs.)

- 77440 Enhanced excitation transfer during vibrational relaxation after pumping and generalized Forster's formula.** H.Sumi (Inst. of Materials Sci., Univ. of Tsukuba, Sakura-mura, Ibaraki, Japan). *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1709-12 (23 May 1983). Electron or excitation transfer can be enhanced during vibrational relaxation after optical excitation of a donor. When it occurs after vibrational relaxation with a thermal activation energy E_A , enhanced transfer during vibrational relaxation is also governed by an activation energy E_H which, however, is smaller than E_A or even vanishes. The decrement $E_A - E_H$ depends on the total energy of vibrations triggered by optical excitation, and also on their average direction relative to that of the activation barrier for transfer in the phonon-coordinate space. (11 refs.)
- 77441 Low-frequency secondary radiation in polar semiconductors at finite temperatures.** F.Comas, C.Trallero Giner (Dept. of Theoretical Phys., Havana Univ., Havana, Cuba). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.445-53 (1 April 1983). Secondary radiation in polar direct-gap semiconductors is considered for finite, but not too large, temperatures. For sufficiently pure and perfect samples, photoexcited electrons (holes) relax via phonon scattering. Assuming an infinite recombination time, the differential cross-section for photon emission is calculated in the low-frequency region of the spectra. Rather intense secondary radiation is predicted for high temperatures. The general shape of emission and excitation spectra is discussed in detail. (11 refs.)
- 77442 Decay behaviour of high-excitation luminescence in GaP:N. I. Model for the decay of two coexisting phases.** H.Weinert (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany). *Phys. Status Solidi b (Germany)*, vol.116, no.2, p.525-32 (1 April 1983). The time behaviour of the radiative recombination of nitrogen-doped GaP is investigated at pulsed intense optical excitations and low temperatures ($T=2$ and 27 K). The decay behaviour of the luminescence intensities corresponding to the electron-hole liquid (EHL) and the coexisting low-density phase (LDP) is found for all nitrogen concentrations ($n_N=2 \times 10^{17}$ to $2.9 \times 10^{18} \text{ cm}^{-3}$) to be nonexponential. It is interpreted as a consequence of interactions between both coexisting phases. A model is introduced where the EHL is fed by the LDP continuously. It describes the observed decay of the luminescence very well, even for different nitrogen concentrations and different excitation intensities. (20 refs.)
- 77443 Decay behaviour of high-excitation luminescence in GaP:N. II. Experimental results on the densities of the coexisting phases and the relevant recombination processes.** H.Weinert, R.Bindemann, K.Kreher (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.247-53 (1 May 1983). For pt.1 see *ibid.*, vol.116, p.525 (1983). The radiative recombination of isoelectronic nitrogen-doped GaP is investigated under high optical excitation at several temperatures ($T=2$, 4.2 , 27 , and 77 K). A previously reported phase separation is confirmed. The parameters of the electron-hole liquid and the coexisting low-density phase are determined both from luminescence spectra and decay measurements. The dominating recombination processes for the carrier system are found to be phonon-assisted band-to-band Auger recombination, phononless radiative recombination with participation of the nitrogen impurities, and phononless Auger recombination with participation of the nitrogen impurities. The respective rate coefficients are determined. (11 refs.)
- 77444 Radiative recombination in γ -La₂S₃ single crystals.** A.N.Georgobiani, M.V.Glushkov, E.S.Logozinskaya, Zh.A.Pukhlii, I.M.Tiginyanu, A.A.Scherbakov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.311-17 (16 March 1983). The photoluminescent properties of specially undoped γ -La₂S₃ single crystals are investigated. An interpretation of the complicated behaviour of the emission band under various excitation conditions is given, based on the concept of donor-acceptor pairs. A scheme of the deep levels and the electron transitions in γ -La₂S₃ single crystals is presented. (22 refs.)
- 77445 Electric field-induced quenching of luminescence in quantum wells.** E.E.Mendez, G.Bastard, L.L.Chang, L.Esaki (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), H.Morkoc, R.Fischer. *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.711-13 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Photoluminescence measurements have been performed on GaAs quantum wells under an electric field perpendicular to them. With an increasing field, the intensity decreases and becomes completely quenched at an average field of a few tens of kV/cm. This is accomplished by a shift to lower energies of the peak positions. The results are interpreted as caused by the field, which induces a separation of electrons and holes and modifies the energies of the quantum states. (8 refs.)
- 77446 Extrinsic photoluminescence from GaAs quantum wells.** R.C.Miller, A.C.Gossard, W.T.Tsang (Bell Labs, Murray Hill, NJ, USA). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.714-16 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Extrinsic photoluminescence has been studied from both undoped and p-type doped single and multiquantum well (MOW) GaAs-Al_xGa_{1-x}As heterostructures grown by molecular beam epitaxy. For undoped MOW samples this luminescence is attributed to $n=1$ electrons recombining with shallow neutral acceptors (probably carbon) near the well center whereas for single well samples the acceptors (probably carbon) are frequently concentrated in a thin GaAs layer at the first grown heterointerface. Ionization energies obtained from these data are in reasonable agreement with the calculations of Bastard. With Be-doped samples one can also see luminescence due to ground state heavy hole excitons bound to Be neutral acceptors. These data provide estimates of the dissociation energy of the heavy hole exciton neutral acceptor complex. (10 refs.)
- 77447 Impurity photoluminescence in GaAs/Ga_{1-x}Al_xAs multiple quantum wells.** B.Lambert, B.Deveaud, A.Regreny, G.Talalaieff (CNET, Lannion, France). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.717-19 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). Luminescence experiments have been performed on multiple quantum wells structures with well thicknesses varying between 100 \AA and 1000 \AA . Varying the laser excitation density between 10 mW cm^{-2} and 5 kW cm^{-2} allows the authors to separate different bands related to hydrogenic impurities. The position of these bands are compared to the results of theoretical calculations on the binding energy of the impurity and on subband position. (9 refs.)
- 77448 Time resolved luminescence in n-i-p-i doping superlattices.** W.Rehm, H.Kunzel, G.H.Dohler, K.Ploog, P.Ruden (Max-Planck-Inst. fur Festkörperforschung, Stuttgart, Germany). *Physica B & C (Netherlands)*, vol.117-118 B+C, pt.2, p.732-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982). The luminescence spectrum of n-i-p-i doping superlattices shows a strong, excitation dependent red shift. Time resolved measurements of the decay of the luminescence provide a valuable tool for the determination of both radiative and non-radiative lifetimes. Results obtained from GaAs n-i-p-i crystals, grown by molecular beam epitaxy, reconfirm that recombination across the indirect gap in real space is the mechanism responsible for the luminescence. The radiative lifetime increases by more than five orders of magnitude during detectable decay, in agreement with the theoretically expected behavior. (8 refs.)
- 77449 Selective site excitation of europium-doped monoclinic Gd₂O₃.** J.G.Daly, J.A.Schmidt (Dept. of Phys., North Dakota State Univ., Fargo, ND, USA), J.B.Gruber. *Phys. Rev. B (USA)*, vol.27, no.9, p.5250-6 (1 May 1983). Monoclinic crystals of Eu³⁺:Gd₂O₃ were studied at 80K with the use of fluorescence spectra to interpret the energy levels. A tunable dye laser was used to selectively excite levels of the ³D_{0,1,2} manifolds. Three distinct crystallographic sites for Eu³⁺ ions were identified for a majority of the Stark levels of the ⁷F_{0,1,2,3,4} and ³D_{0,1} multiplets. Comparisons of the fluorescence spectra from different sites were used in this energy-level assignment. Several fluorescence-lifetime measurements were also recorded. (6 refs.)
- 77450 Formation of lattice defects in CdS crystals by nitrogen laser radiation.** N.E.Korsunskaya, I.V.Markevich, M.D.Moin, M.A.Tanatar, I.Yu.Shablii (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1829-32 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3223-8 (Nov. 1982). [received: May 1983] A study was made of the influence of nitrogen laser radiation on the electrical, photoelectric, luminescence, and optical properties of CdS crystals. It was found that point defects of two types—shallow donors $E_d = E_c - 0.045 \text{ eV}$ and acceptors $E_a = E_v + 0.18 \text{ eV}$ —were formed in the surface layer of a crystal. These defects were sulfur vacancies V_s and interstitial sulfur atoms S_i , or complexes containing them. Irradiation generated a layer in which the exciton transition frequencies differed from those in the bulk of a crystal. This difference was attributed to the influence of electric fields and mechanical stresses generated in this layer by laser irradiation. (13 refs.)
- 77451 Influence of external agencies on nonradiative deactivation of the electron excitation energy in dysprosium-doped neodymium pentaphosphate crystals.** A.V.Krutikov, S.N.Perepetchko, V.P.Sakun, V.A.Smirnov, I.A.Scherbakov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1835-8 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3234-40 (Nov. 1982). [received: May 1983] An analysis of the time evolution of the population of the ⁴F_{3/2} metastable states of Nd³⁺ in lanthanum neodymium dysprosium pentaphosphate was made on the basis of an investigation of the transfer of the electron excitation energy in a condensed medium. Changes in temperature and the application of a magnetic field altered the ratio of the interaction microparameters C_{DA} and C_{DD} and this provided an opportunity to study various models of migration-accelerated relaxation and the ranges of validity of these models. A general approach to the calculation of the rate of migration-limited relaxation W was developed and this made it possible to analyze the experimental results and thus show quantitatively the validity of the hopping model of energy degradation. It was found that an external magnetic field accelerated the rate of energy migration in space. (13 refs.)
- 77452 The superficial nature of subthreshold thermostructural alterations in ZnSe under continuous radiation.** P.V.Vodolazskii, B.R.Kiyak, M.G.Mat-sko, V.B.Nosov, G.T.Petrovskii, A.V.Shatilov. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.4, p.625-7 (April 1983). In Russian. Investigates the low-temperature photoluminescence spectra of ZnSe single crystals at $T=4.2 \text{ K}$ up to and after the action of subthreshold continuous radiation with $\lambda=10.6 \text{ \mu m}$. It is shown that the temperature changes which appear have a surface character. (4 refs.) V.G.P.
- 77453 Energy position of luminescence (photosensitivity) centres in CdSe_{1-x}Te_x solid solutions.** I.B.Ermolovich, M.K.Sheinkman. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.4, p.627-9 (April 1983). In Russian. Presents the results of investigating the photoconductivity electroabsorption and luminescence of single crystals and layers of CdSe_{1-x}Te_x, obtained by evaporation in vacuum. All data on the energy absorption of luminescing centres (photosensitivity) agree between $x=0$ and $x=1$. It is shown that the main photosensitivity centres in CdSe_{1-x}Te_x ($x=0$ to 1) are luminescence centres corresponding to the bands $\lambda_{\text{max}}=0.95 \text{ \mu m}$ and $\lambda_{\text{max}}=1.19 \text{ \mu m}$ in CdSe spectra. (12 refs.) V.G.P.
- 77454 Luminescence kinetics of lead compounds.** M.U.Belyi, N.G.Musienko, B.A.Okrimenko. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.672-5 (May 1983). In Russian. Luminescence kinetics of complex Pb compounds has been investigated over a 90-200K temperature range. The luminescence spectrum is found to be not simple. This spectrum is divided into elementary parts. Four excited electron states are found for the Pb²⁺ ion, two of which are metastable. Depths of the metastable levels are estimated. (13 refs.)
- 77455 Colour centre luminescence of α -Al₂O₃.** V.A.Grigorov, E.F.Martynovich, A.G.Tokarev. *Ukr. Fiz. Zh. (USSR)*, vol.28, no.5, p.784-5 (May 1983). In Russian. Investigates the colour centre absorption and photoluminescence spectra of α -Al₂O₃ monocrystals irradiated with reactor neutrons. A new radiation band with a maximum of 3.82 eV has been found, which coincides with the F⁺-centre band but which is excited beyond the absorption boundary of F⁺-centres. (4 refs.) V.G.P.
- 77456 Deep acceptor photoluminescence in GaAs.** T.Nishino, Y.Fujiwara, Y.Hamakawa (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan). Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.71-8. Low-temperature photoluminescence of deep acceptors associated with 3d transition metals in GaAs has been studied, with particular emphasis on the near-infrared luminescence in Ni-diffused GaAs. It has been found that the intracenter luminescence due to Ni deep acceptors depends in a complicated way upon the substrate crystals into which Ni is diffused. These results are compared with the well-known intracenter luminescence in GaAs:Cr. (10 refs.)

77457 Photoluminescence of oxygen-induced states in GaAs_{1-x}P_x. D.J.Wolford (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), S.Modesti, B.G.Streetman. Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.501-8. Reports the photoluminescence (PL) of O-doped GaAs_{1-x}P_x. O-induced gap states are formed by implantation and unambiguously identified from their O-dependence and known origins in GaP. Prominent PL is attributable to formation of ZnO near neighbor (isoelectronic trap) complexes and more distant O-donor-Zn-acceptor pairs. Resulting ZnO trap and O-donor levels behave as deep electron states, varying linearly in x with slopes of -5.45 and -7.1 meV/% GaAs, respectively. Extensions to x=0 identify 0.64 eV PL in GaAsO as O_{As}-related DA pair recombination. The authors predict O_{As} induces in GaAs a deep donor near E_c-0.79 eV and acceptor-O_{As} isoelectronic complexes just below the conduction band edge. (41 refs.)

78.60F Electroluminescence

77458 Electrolumiphors on the basis of ZnS:Sn. S.Pakeva, R.Dafinova (Sofia Univ., Sofia, Bulgaria). *Phys. Status Solidi a (Germany)*, vol.76, no.1, p.K77-80 (16 March 1983). The electroluminescence properties of ZnS:Sn are studied in a dismountable cell. The active layer consisted of electroluminescent powder mixed with castor oil. The width of the so prepared electroluminescent cell can easily be changed and adjusted with a precision of 20 μm. The brightness is not very strong, but separate small spots glow especially brightly. In a qualitative aspect the characteristics of the ZnS:Sn electrolumiphors do not differ from the corresponding characteristics of the ZnS:Cu electrolumiphors. (11 refs.)

77459 Zero-phonon lines in electroluminescence and photoluminescence of ZnS:Mn thin films grown by atomic layer epitaxy. W.Busse (Inst. fur Festkörperfys., Tech. Univ. Berlin, Berlin, Germany), H.-E.Gumlich, R.O.Tornqvist, V.-P.Tanninen. *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.553-8 (16 April 1983). The energy of the zero-phonon-lines of the transition ⁶A₁→⁶E, ⁶A₁→⁴T₂ and ⁴T₁→⁶A₁ within the 3d-shell of Mn²⁺ in thin films of ZnS:Mn grown by atomic layer epitaxy (ALE) are determined by luminescence spectroscopy. A comparison of these values with the energies obtained with polymorphic ZnS:Mn single crystals indicates a predominantly hexagonal structure in the thin films in fair agreement with the data obtained by X-ray analysis. The zero-phonon-lines in both photoluminescence and high field electroluminescence of thin films are compared. (13 refs.)

78.60H Cathodoluminescence, ionoluminescence

77460 Effects of Cd-vapor and Te-vapor heat treatments on the luminescence of vapor-phase-grown CdTe. C.B.Norris (Sandia Nat. Labs., Albuquerque, NM, USA), L.R.Shiozawa. *J. Electron. Mater.* (USA), vol.12, no.2, p.267-87 (March 1983). From cathodoluminescence measurements at 80-300K, the authors report the first studies of the effects of Cd-vapor and Te-vapor heat treatments on the injection level dependence, temperature dependence, and frequency response of the luminescence in vapor-phase-grown (VPG) CdTe. At 80K, the as-grown material shows edge emission near 1.57 eV together with an extrinsic band near 1.4 eV and a weak extrinsic band near 1.2 eV. Following heat treatment in Cd-vapor, both the 1.4 eV and 1.2 eV bands are enhanced and the 1.2 eV band is joined by an overlapping band centered near 1.1 eV. Moderate heat treatments in Te-vapor weaken the 1.4 eV and 1.2 eV bands but enhance a band near 1.54 eV that is noticeable as a weak shoulder on the low energy side of the edge emission in as-grown material. (10 refs.)

77461 Effect of ionization density on the time dependence of luminescence from liquid argon and xenon. A.Hitachi, T.Takahashi (Inst. of Phys. & Chem. Res., Saitama, Japan), N.Funayama, K.Masuda, J.Kikuchi, T.Doke. *Phys. Rev. B (USA)*, vol.27, no.9, p.5279-85 (1 May 1983).

The time dependence of luminescence in liquid argon and xenon has been studied for electron, α-particle, and fission-fragment excitation. The lifetimes of low excited molecular states (¹Σ_g⁺ and ³Σ_g⁺) do not depend on the density of excited species while the intensity ratio of ¹Σ_g⁺ to ³Σ_g⁺ is found to be larger at higher deposited energy density. The lifetimes obtained for the ¹Σ_g⁺ and ³Σ_g⁺ states are 7.0±1.0 nsec and 1.6±0.1 μsec, respectively, in liquid argon, and 4.3±0.6 and 22.0±2.9 nsec, respectively, in liquid xenon. The mechanism of quenching of luminescence at high density of excited species in liquid argon and xenon is discussed. (34 refs.)

77462 Localization of electronic states and cathodoluminescence of bound exciton complexes in ZnSe crystals. V.S.Vavilov, Vu Zoon Mien, G.N.Ivanov, D.D.Nedoglo, A.V.Simashkevich, M.V.Chukichev (V.I. Lenin State Univ., Kishinev, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.12, p.2091-4 (Dec. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.12, p.3670-5 (Dec. 1983). The cathodoluminescence spectra of ZnSe crystals doped with a shallow donor impurity were investigated in the temperature range 4.2-300K. It was established that the form of the edge luminescence spectra depended on the impurity concentration. At low temperatures when the donor concentration was N_d=1×10¹⁶ cm⁻³, electrons were fully localized at impurities. The conduction process in the crystals was then of a hopping nature and the luminescence spectrum exhibited a fine structure of the lines due to the luminescence emitted by bound exciton complexes. An increase in the impurity concentration above 10¹⁶ cm⁻³ resulted in delocalization of electrons from impurities, formation of an impurity energy band, and dissociation of exciton-impurity complexes. (10 refs.)

78.60K Thermoluminescence

77463 Thermoluminescence and optical absorption studies. Rubidium bromide doped with barium. S.B.S.Sastry, S.Nagarajan (Dept. of Phys., Indian Inst. of Technol., Madras, India). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.171-5 (1 May 1983). Thermoluminescence (TL) and optical absorption studies are made on RbBr:Ba²⁺. An absorption band due to Z₁-centres appears at 1.58 eV on F-light bleaching subsequent to γ-irradiation. A TL glow peak attributable to Z₁-centres is identified. TL emission under the main glow peak shows a broad emission at 2.65 eV with a shoulder at 1.95 eV. This 1.95 eV emission is attributed to V₃^M-centres which give rise to an absorption band around 4.1 eV. A tentative energy band scheme is suggested explaining the various TL processes. (15 refs.)

77464 On the mechanisms of thermoluminescence and deformation luminescence in gamma-irradiated KCl. R.Mayer, A.Winnacker (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany). *Radiat. Eff. (GB)*, vol.64, no.1-4, p.135-41 (1982). [received: May 1983]. (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Thermoluminescence (TL) and deformation luminescence (DL) studies in KCl γ-irradiated at room temperature are reported. The roles that F-centres and their higher conglomerates on the one hand, and V₂- and V₃-centres as recombination centres on the other hand, play in these processes are specified. Two peaks at 2.5 eV and 3 eV are observed in the emission spectra of both TL and DL. The close relationship between TL and DL is confirmed. (9 refs.)

77465 I. The emission spectra of TL produced by ion implanted CaF₂. U.Bangert, K.Thiel (Inst. fur Kernchemie, Univ. Koln, Koln, Germany), K.Ahmed, P.D.Townsend.

Radiat. Eff. (GB), vol.64, no.1-4, p.143-51 (1982). [received: May 1983]. (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Rare earth doping of CaF₂ produces material which gives strong thermoluminescence signals. In an attempt to separate the influence of impurity and intrinsic defects CaF₂ has been implanted with ions of Ce, Dy, Mn, Ca and F. Comparisons are made with chemically doped samples and the effect of thermal treatments have been made in all cases. The cerium and dysprosium ions influence both the shallow charge trapping levels, which determine the temperature of the glow peaks, and the recombination sites which control the photon spectra. After implantation the strong TL signals show emission at wavelengths near 360 nm for Ce, 480 nm for Dy and for Mn. Re-excitation of the trapping levels reveals selective emission for some defects, restructuring of less stable defects and major changes in defect concentrations with thermal treatment. The effects of impurity and intrinsic defects on the spectra are discussed. One major observation is that addition of cerium to 'pure' samples does not enhance the TL sensitivity, whereas Dy and Mn both show new glow peaks. In the case of Dy it is thought that the charge trap and the luminescent site are directly linked within one complex defect. (13 refs.)

77466 II. Thermally induced changes in the TL of ion implanted CaF_2 . U.Bangert, K.Thiel (Inst. fur Kernchemie, Univ. Koln, Koln, Germany), K.Ahmed, P.D.Townsendm. *Radiat. Eff. (GB)*, vol.64, no.1-4, p.153-60 (1982). [received: May 1983] (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
For pt.1 see *ibid.*, vol.64, p.143 (1982). Thermal treatment of CaF_2 has a significant influence on the number and intensity of the peaks seen by thermoluminescence. A combination of ion implants and anneal cycles leads to the conclusion that the 90°C glow peak is derived from a defect of a substitutional impurity (e.g. Ce^{+3}) linked to an interstitial fluorine ion. Perturbations of this centre by other defects modify the centre and the glow peak temperature is raised to 110°C. The peaks at 180, 220 and 350°C all involve intrinsic defect clusters. The building of models for the different glow peaks was helped by a comparison of impurity and self ion implantations. (15 refs.)

78.65 OPTICAL PROPERTIES OF THIN FILMS

77467 Selective properties of overcoated copper granular films. S.Damas-kinos, F.E.Girouard, Vo-Van Truong (Dept. of Phys., Univ. de Moncton, Moncton, New Brunswick, Canada). *Can. J. Phys. (Canada)*, vol.61, no.5, p.709-13 (May 1983).
Granular copper films were formed by thermal evaporation of copper onto glass substrates maintained at 300°C. They were subsequently overcoated at room temperature with a thick layer of aluminium having a thickness of ~100 nm. The optical properties of the overcoated films have been studied in the spectral region from 0.3 to 1.0 μm . Results indicated that the granular films preserved their aggregate structure even after overcoating. Successive annealings showed a considerable lowering of reflectivity over this spectral range and suggested the potential use of such a system of overcoated granular films for solar energy collection. (16 refs.)
77468 Electron-hole drops in vanadium dioxide. A.A.Bugaev, V.V.Gudyalis, B.P.Zakharichyena, F.A.Chudnovskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.10, p.440-2 (20 Nov. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.10, p.363-5 (20 Nov. 1982). [received: June 1983].
The detection of anisotropy in the coefficient of reflection, induced by picosecond excitation of a vanadium dioxide film with quantum energy 1.17 eV, is reported. The phenomenon is related to the formation of electron-hole drops. (4 refs.)
77469 The effect of particle size on the haze of polymer films. R.J.Tabar, C.T.Murray, R.S.Stein (Polymer Res. Inst., Univ. of Massachusetts, Amherst, MA, USA). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.5, p.831-3 (May 1983).
Haze in thin polymer films is discussed in terms of the scattering of unpolarized monochromatic light by a medium containing isotropic random inhomogeneities. It is shown that haze is not necessarily reduced by reducing the size of the inhomogeneities in the polymer film but that there is a critical size when the haze is at a maximum. (7 refs.)
77470 Refractive index of GaAs-AlAs superlattice grown by MBE. Y.Suzuki, H.Okamoto (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Musashino-shi, Tokyo, Japan). *J. Electron. Mater.* (USA), vol.12, no.2, p.397-411 (March 1983).
Refractive index \bar{n} of GaAs-AlAs superlattices grown by MBE is measured in the spectral range 1.2-1.8 eV at 300K. Results show that for superlattices with $L_B \leq 40-50 \text{ \AA}$, \bar{n} is determined by the averaged AlAs mole fraction, but that for superlattices with $L_B \geq 40-50 \text{ \AA}$, \bar{n} is determined by energy separation of confined electrons and holes (E_c - e - h). (10 refs.)
77471 Picosecond reflectivity measurements on glow discharge a-Si:H. H.Bergner (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany), V.Bruckner, D.Dietrich, F.Kerstn, W.Nowick. *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.197-202 (1 May 1983).
The temporal behaviour of photoinduced charge carriers in amorphous hydrogenated silicon films is studied by means of time-resolved reflectivity measurements using a Nd:YAG laser. The investigated a-Si:H films, deposited by the glow discharge technique under systematic variation of the silane-hydrogen pressure, show different structures and defects. The temporal behaviour of the non-equilibrium charge carriers of all samples is determined by a two-step relaxation process. In accordance with the model the photoexcited carriers relax from the conduction band to an intermediate state in the mobility gap and then to the ground state. The characteristic times of these relaxation processes are 30 to 85 ps and 0.75 to 2.5 ns, respectively. The influence of the structure of the a-Si:H films on the relaxation times is discussed. (11 refs.)
77472 Polarized light absorption of the magnetic semiconductor CdCr_2Se_4 . I.S.Edelman, G.Dustmuradov, V.P.Kononov (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Phys. Status Solidi b (Germany)*, vol.117, no.1, p.351-4 (1 May 1983).
The absorption of polarized light in CdCr_2Se_4 thin films in the spectral region 10000 to 22000 cm^{-1} at different temperatures is investigated. Through the whole spectral region the absorption intensity differs for right-handed and left-handed circularly polarized light or for parallel and perpendicular linearly polarized light. The character of the temperature and polarization dependence of the absorption intensity is different for different parts of the spectrum. The observed absorption is considered as a sum of the interband transitions and the transitions between localized states. (12 refs.)
77473 Faraday rotation in the exciton part of the spectrum of CuBr. Vo Hoang Thai, V.K.Miloslavskii, V.V.Mussil (A.M. Gorki State Univ., Kharkov, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1859-60 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3276-8 (Nov. 1982). [received: May 1983].
Thin epitaxial CuBr films grown on NaCl crystalline substrates with the $100\text{NaCl}||100\text{CuBr}$ orientation were used in a study of the absorption spectra and of the Faraday rotation. The difference between the thermal expansion coefficients of NaCl and CuBr (39×10^{-6} and $19 \times 10^{-6} \text{ K}^{-1}$) and the temperatures at which the samples were prepared (420K) and measured (90K) gave rise to thermal stresses in the CuBr film

and these split at low-frequency exciton peak $z_{1,2}$ ($\Gamma_8 \times \Gamma_6$, 1s exciton) into two components: $z_1(\Gamma_6 \times \Gamma_6$, 1s, wave vector group D_{2d}) and $z_2(\Gamma_7 \times \Gamma_6$, 1s). A comparison and analysis of the experimental data on the spectral dependences of the angle of rotation of the plane of polarization in a magnetic field $H=2 \text{ T}$ and of the optical density $D(E)$ with the exciton bands approximated by Lorentzian profiles was used to determine the g factors of the z_1 , z_2 , and z_3 peaks, which were $g_1=-0.34 \pm 0.05$, $g_2=1.14 \pm 0.1$, and $g_3=1.02 \pm 0.11$, as well as their oscillator strengths (2.08×10^{-2} , 1.02×10^{-2} , and 1.34×10^{-2} per unit cell). The method of invariants was used to show that, under the simultaneous action of a magnetic field and thermal stresses, the g factors g_1 and g_2 were related to the electron g factor g_e and to the hole factor $2\bar{x}$ by $g_1=-g_e-6\bar{x}$ and $g_2=g_e-2\bar{x}$ subject to the condition $\Delta \gg \Delta_{\text{exch}}$, where Δ is the energy of splitting due to thermal stresses and Δ_{exch} is the exchange interaction energy. The values of the band g factors were found to be $g_e=0.94 \pm 0.08$ and $\bar{x}=-0.1 \pm 0.02$. (6 refs.)
77474 Thermal modulation spectrum and electron structure of niobium. A.I.Golovashkin, A.L.Shelekhov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1897-9 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3339-43 (Nov. 1982). [received: May 1983].
Spectra of the thermal modulation of the reflection coefficient $\beta=d(\ln R)/dT$ of niobium were recorded in the range 0.5-3.1 eV. The method of least squares was applied to the thermal modulation spectra and this yielded the most important electronic characteristics of Nb: the Fourier components of the pseudopotential, the collision frequencies and densities of electrons participating in interband transitions, as well as the densities and collision frequencies of conduction electrons. The observed changes in the thermal modulation spectra of Nb due to a deterioration of the quality of the samples were attributed to the broadening of a peak of the density of electron states near the Fermi energy on a reduction in the mean free path of electrons. (see also 71.65 Positron states)

77476 Study of positron lifetimes in α , β and γ cerium at high pressures. A.M.Boring, C.-Y.Huang (Los Alamos Nat. Lab., Los Alamos, NM, USA), K.A.Gschneidner, Jr., J.D.McGervey, M.Panigrahi, S.G.Umar. *J. Magn. & Magn. Mater. (Netherlands)*, vol.37, no.1, p.L7-10 (May 1983).
The positron lifetimes in the α , β and γ phases of Ce have been measured by applying hydrostatic pressure (up to 1.4 GPa) and by reducing the temperature (to 80K). Two-component fitting programs showed that the main com-

ponent ($\approx 90\%$) had virtually the same mean lifetime (≈ 233 ps) in all three phases. The uncertainty in each lifetime was ± 2 ps. With this high precision, the results are in agreement with those of band calculations which give the same number of 4f electrons (≈ 1.2) in all phases. (26 refs.)

77477 Positron annihilation on pure and carbon-doped α -iron in thermal equilibrium. L. De Schepper (Materials Phys. Group, Limburgs Univ. Centrum, Diepenbeek, Belgium), D. Segers, L. Dorikens-Vanpraet, M. Dorikens, G. Knuyt, L. M. Stals, P. Moser.

Phys. Rev. B (USA), vol. 27, no. 9, p. 5257-69 (1 May 1983).

Positron-annihilation S-parameter measurements in thermal equilibrium on pure and carbon-doped (50 and 750 at. ppm) α -iron are presented. It is shown that trapping of positrons on both monovacancies and carbon-vacancy pairs occurs, even far above the dissociation temperature of the vacancy pairs. Therefore, a three-state trapping model is used in the analysis of the measured S curves. The vacancy-formation enthalpy in both the paramagnetic and ferromagnetic state is deduced: It is found to be 1.79 ± 0.10 eV in the paramagnetic state and 2.0 ± 0.2 eV in the ferromagnetic state. These values are larger than those published so far. The activation enthalpy for vacancy migration obtained by combining the values cited above with recently published self-diffusion enthalpy values confirms the applicability of the one-interstitial model in α -iron. 77478 X-ray spectroscopic study of ternary chalcopyrite semiconductors of the type CuMS_2 ($M = \text{Al, Ga, In, Tl}$). A. P. Deshpande, V. B. Sapre, C. Mande (Dept. of Phys., Nagpur Univ. Campus, Nagpur, India).

J. Phys. C (GB), vol. 16, no. 13, p. L433-5 (10 May 1983).

The chemical shifts of the K absorption discontinuity of copper have been studied in the ternary chalcopyrite compounds CuMS_2 ($M = \text{Al, Ga, In, Tl}$). It is observed that there exists a linear relationship between the chemical shift ΔE and the band gap E_g in the systems. This relationship has been used to estimate the band gap in the compound CuTiS_2 , which comes out to be about 1.39 eV. (11 refs.)

77479 Amorphous problem in EXAFS data analysis. A. L. Ageev, Yu. A. Babanov, V. V. Vasin, N. V. Ershov, A. V. Serikov (Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).

Phys. Status Solidi b (Germany), vol. 117, no. 1, p. 345-50 (1 May 1983).

It is shown that the radial atomic distribution function for disordered systems can, in principle, be determined from the oscillating extended fine structure of X-ray absorption spectra using the regular algorithms of solution of incorrect problems. The radial atomic distribution function for $\text{Fe}_{50}\text{B}_{50}$, obtained from experimental EXAFS data and corresponding to the results of diffraction studies, is presented. (14 refs.)

77480 X-ray K-absorption fine structure study of $\text{Cu}_x\text{Zn}_{1-x}\text{Fe}_2\text{O}_4$ ($x = 0.2, 0.4, 0.6$ and 0.8). V. Sahasrabudhe (Dept. of Phys., Shivaji Univ., Kolhapur, India).

Solid State Commun. (USA), vol. 46, no. 9, p. 697-703 (June 1983).

For $\text{Cu}_x\text{Zn}_{1-x}\text{Fe}_2\text{O}_4$ spinel ferrites ($x = 0.2, 0.4, 0.6$ and 0.8), EXAFS of Cu and Fe K-absorption edges have been studied employing LSS theory. With change in copper content, in the spinel system, the basic dependence of cation distribution on degree of inversion has been reported by plotting variation of bond distance 'd' with EXAFS parameter 'a'. This is further substantiated by plotting chemical shifts (ΔE) with EXAFS parameter 'a'. The necessity of the determination of final state wavefunction for the knowledge of distribution of charge is stressed. (20 refs.)

77481 Absorption of unsupported photo resist films using synchrotron radiation in the region from 4.5 nm to 30 nm. R. J. Howe, D. M. Shinozaki, J. W. McGowan (Univ. of Western Ontario, London, Ontario, Canada).

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p. 26

The linear absorption coefficients for resist materials polymethyl-methacrylate (PMMA), poly(butene-1-sulfone) (PBS), phenylvinyl ketone (PVK), poly(methyl isopropenyl ketone) (PMIPK), tert butyl vinyl ketone (TBVK) and Kodak negative resist K747 have been calculated from measured $\mu \times$ graphs. Graphs obtained are collected from information of the incident intensity and transmitted intensity through each sample using a well collimated photon beam produced from the 'Tantalus' storage ring. Irradiation damage was also performed on several samples and produced differences in the $\mu \times$ graphs demonstrating various damage modes. For example, some of the samples show discrete mass loss behavior while others demonstrate absorption changes with mass loss. (no refs.)

78.70E X-ray emission threshold and fluorescence

77482 Soft X-ray emission spectra of aluminium in β -phase Cu-Ni-Al and Cu-Mn-Al alloys. K. Tanaka, T. Saito, M. Yasuda (Dept. of Metall. Engng., Nagoya Inst. of Technol., Nagoya, Japan).

J. Phys. Soc. Jpn. (Japan), vol. 52, no. 5, p. 1718-24 (May 1983).

Electronic states associated with aluminium atoms in ternary Cu-Ni-Al and Cu-Mn-Al alloys with B2 and L2₁ order structures, respectively, were investigated by measuring Al K β emission spectra. The spectra generally consisted of three peaks which changed in strength and in energy (Cu-Mn-Al) systematically with compositions. The lower two peaks were assigned to bonding states of aluminium 3p electrons hybridizing with the 3d states of copper and nickel or manganese atoms. These assignments were consistent with a CPA model calculation on the K emission spectra of transition-transition and transition-simple metal alloys by Kudrnovsky et al.

78.90 OTHER TOPICS IN OPTICAL PROPERTIES OF CONDENSED MATTER AND OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION

77483 Channeling of light in a medium with a periodically varying refractive index. O. V. Konstantinov, I. A. Shmulevich (A. F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys-Solid State (USA), vol. 24, no. 11, p. 1817-21 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol. 24, no. 11, p. 3201-9 (Nov. 1982). [received: May 1983]

It is shown that in the propagation of light along the layers of a three-dimensional phase grating the optical field becomes localized in regions having a high refractive index. This effect is analogous to the channeling of fast electrons in single crystals. The localization is analyzed both numerically and by means of an approximate analytical solution of the wave equation that is a generalization of the well known Raman-Nath solution, the latter does not predict any localization. The effect occurs only when the light wavelength λ is much less than the lattice period $d \propto \sqrt{u_1/2}$, where u_1 is the amplitude of sinusoidal modulation of the refractive index. In that case, it can be regarded as the result of light focusing by a converging lens with a distributed variation of the refractive index. The occurrence of strong focusing at a distance $f = d/4\sqrt{u_1}$ is predicted. Ordinary channeling occurs at distances exceeding f . (19 refs.)

79.00 ELECTRON AND ION EMISSION BY LIQUIDS AND SOLIDS; IMPACT PHENOMENA

79.20 IMPACT PHENOMENA

(inc. electron spectra and sputtering)

77484 Angular distribution of particles escaping at low angles to the surface of a medium as a function of the depth of location of the plane source within the material. V. S. Remizovich (Engng.-Phys. Inst., Moscow, USSR).

Sov. Phys-Dokl. (USA), vol. 27, no. 8, p. 621-3 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol. 265, no. 4-6, p. 863-7 (Aug. 1982). [received: May 1983]

The problem of calculating the angular and energy distributions of particles reflected in 'glancing' incidence is a particular case of the more general problem of calculating the spectrum of particles escaping from a medium when a plane source emitting particles at a low angle to its plane is present with the material. An analytical expression is obtained for the angular spectrum of escaping particles in the case of purely elastic scattering when a plane source is present within the material. (8 refs.)

79.20D Laser-light impact phenomena

77485 Comments on 'Laser excitation of surface electronic states for a one-dimensional semiconductor' by W. C. Murphy and T. F. George. G. W. Bryant (McDonnell Douglas Res. Labs., St. Louis, MO, USA).

Surf. Sci. (Netherlands), vol. 127, no. 3, p. L149-55 (May 1983).

For original paper see ibid., vol. 114, p. 189 (1982). Murphy and George calculated the optical absorption cross section for the transfer of electrons from valence states to localized surface states in a semiconductor modeled by a finite one-dimensional chain. They suggested that by using a laser to excite electrons to or from the surface states, one can control the surface charge and the electrostatic force between the surface and an adsorbed species. The present author corrects several important errors in their presentation and indicate how their conclusions must be modified. (4 refs.)

77486 Reply to comments on 'Laser excitation of surface electronic states for a one-dimensional semiconductor' by G. W. Bryant. W. C. Murphy, K. T. Lee, T. F. George (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA).

Surf. Sci. (Netherlands), vol. 127, no. 3, p. L156-8 (May 1983).

For original paper see ibid., vol. 114, p. 189 (1982). For comments see ibid., vol. 127, p. L149 (1983). A semiconductor modeled by a finite one-dimensional chain is shown to have either a continuous or discrete number of surface states. The exact number is determined by the choice of phase factors. Laser-induced charge transfer of electrons from the bulk to these surface states is also shown to be a maximum at the band edge. (5 refs.)

77487 Laser formation of a 'cold liquid'. A. B. Gerasimov, I. A. Gogoladze, A. A. Tsertsvadze.

Sov. Tech. Phys. Lett. (USA), vol. 8, no. 9, p. 444-5 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol. 8, no. 17-18, p. 1032-5 (Sept. 1982). [received: May 1983]

The authors examine the thermodynamics of the formation of a cold liquid. They consider the melting of a sample as it absorbs a laser beam. They assume that the photon energy satisfies $\epsilon_0 \approx \Delta E$, where ΔE is the energy gap of the amorphous substance; in other words, an electron is transferred from the valence band to the bottom of the conduction band. This process is accompanied by an increase in the potential energy of the solid phase. (4 refs.)

79.20F Electron impact: Auger emission

- 77488** Comment on 'Spin-polarized Auger spectroscopy from magnetically ordered solids'. G.Zajac, J.Zak, S.D.Bader (Argonne Nat. Lab., Argonne, IL, USA). *Phys. Rev. Lett. (USA)*, vol.50, no.21, p.1713 (23 May 1983). For original paper see M. Landolt and D. Mauri, *ibid.*, vol.49, p.1783 (1982). Landolt and Mauri have demonstrated the importance of spin-polarized Auger spectroscopy in opening up new perspectives in the study of magnetic solids. They detected a strongly polarized satellite of unknown origin, above the Fe $M_{2,3}VV$ transition, that had no visible counterpart in the intensity spectrum. The present authors identify this satellite as being due to autoionization emission corresponding to the resonant 3p-to-3d transition, and report its observation in the unpolarized intensity spectrum of polycrystalline Fe. Since this process is the electron-stimulated analog of resonant photoemission, it is of interest in providing new insights also into the role of many-body effects in electron spectroscopies. 79.20H Electron impact: secondary emission

- 77489** Electron backscattering at various angles of incidence. H. J. Fitting, R. Technow (Sektion Phys., Wilhelm-Pieck-Univ. Rostock, Rostock, Germany). *Phys. Status Solidi a (Germany)*, vol.76, no.2, p.K151-4 (16 April 1983). The authors have tried to find a simple empirical expression including as the only parameter the integral backscattering ratio η_0 at normal incidence. Similarly they were successful in describing the electron penetration, the energy depth transfer, and the energy distribution of backscattering and transmitted electrons. (14 refs.)

79.20K Other electron impact phenomena

- 77490** The relative importance of multiple inelastic scattering in the quantification of EELS. A.J.Bourdillon, D.J.Hall, C.J.Morrison, W.M.Stobbs (Dept. of Metall. & Materials Sci., Cambridge Univ., Cambridge, England). *J. Microsc. (GB)*, vol.130, pt.2, p.177-86 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). A comparison is given of energy loss results obtained for the L and K edges of aluminium as a function of specimen thickness, crystallographic orientation and collection angle. It is demonstrated that as the thickness is increased post-loss elastic scattering is generally important in reducing the fraction of electrons collected. The implications for the quantification of EELS data are discussed while a comparison of the Fe/C ratio in cementite demonstrates the improved consistency which can be obtained when comparing K and L losses at lower energy separation than are the losses for aluminium. (19 refs.)
- 77491** Retrieval of single-loss profiles from energy-loss spectra. A new approach. P.Schattschneider (Inst. of Appl. & Tech. Phys., Tech. Univ. Vienna, Vienna, Austria). *Philos. Mag. B (GB)*, vol.47, no.5, p.555-60 (May 1983). A new method to recover the single-loss probability p_1 from an electron-energy loss spectrum, taken in transmission, is presented. Previously used methods are either limited to specimens not exceeding a thickness of one mean free path length, or afford data-sampling over much more of an extended energy interval than one is interested in. The new method exhibits neither of these shortcomings. Assuming that no energy-gain processes take place, all spectra involved are redefined in terms of triangular matrices. Based upon the Poisson distribution for multiple scattering, a series expansion for the matrix corresponding to p_1 is then derived. The series is shown to converge for any finite thickness of the specimen. (11 refs.)
- 77492** Inelastic electron scattering from small metal spheres. P.C.Das, J.I.Gersten (Dept. of Phys., City Coll., City Univ. of New York, New York, NY, USA). *Phys. Rev. B (USA)*, vol.27, no.9, p.5412-18 (1 May 1983). Inelastic electron scattering from isolated metal spheres is considered. Expressions for the scattering cross section and for radiative scattering are derived. The only energy-loss mechanism studied here is due to local plasma-oscillation excitation. (4 refs.)
- 77493** Multiplet effects and breakdown of dipole selection rules in the 3d-4f core-electron-energy-loss spectra of La, Ce, and Gd. J.A.D.Matthew (Dept. of Phys., Univ. of York, Heslington, England), G.Strasser, F.P.Netzer. *Phys. Rev. B (USA)*, vol.27, no.9, p.5839-41 (1 May 1983). Electron-energy-loss spectra of La, Ce, and Gd in the region of the 3d¹⁰4fⁿ-3d⁹4fⁿ⁺¹ excitations show doublet structures associated with each spin-orbit component. The relative intensities of the structures vary systematically with excitation energy, the lower-energy component being emphasized at lower primary energies. The effects are interpreted in terms of the multiplet structure of the final state coupled to progressive breakdown of optical selection rules with decreasing energy of the exciting beam. (10 refs.)

- 77494** Variation of the characteristic electron energy loss spectra of molybdenum, doped with Ba⁺ ions. B.Ye.Umirzakov, M.T.Normuradov, A.Kh.Kasymov. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.6, p.151-3 (June 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.6, p.1237-9 (June 1982). [received: May 1983] Presents the results of a study of the variation of the electron energy loss spectra (EELS) of Mo for the cases of doping with Ba⁺ ions and adsorption of Ba atoms. (9 refs.)
- 77495** A new scattering mechanism for EELS. W.L.Schaich (Phys. Dept., Indiana Univ., Bloomington, IN, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.L145-8 (May 1983). Estimates the efficiency of a new mechanism for the scattering of slow electrons by vibrations at a metal surface. The coupling is long ranged but its scattering characteristics resemble more those of impact rather than those of dipole scattering. This similarity applies to both angular dependence and overall strength. (9 refs.)
- 77496** Multiple scattering of relativistic particles in crystals. N.F.Shul'ga, V.I.Truten', S.P.Fomin (Physicotech. Inst., Acad. of Sci., Kharkov, Ukrainian SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.27, no.11, p.1399-400 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2279-80 (Nov. 1982). [received: May 1983] The authors address a new and important feature of fast particle scattering in crystals, i.e. in crystals without channeling the mean square of the scattering angle of a relativistic particle may greatly exceed the mean square scattering angle in amorphous materials. This difference is a result of correlations between successive collisions of the particles with atoms in the lattice and is strongly dependent on the angle between the crystallographic axes and the momentum vector of the incoming particles, the particle energy, and the crystal thickness. (9 refs.)
- 77497** Energy loss measurements on Co₅Sm thin films. P.Schattschneider, J.Fidler, V.Chopov (Inst. für Angewandte und Tech. Phys., Tech. Univ. Wien, Wien, Germany). *Vak.-Tech. (Germany)*, vol.32, no.3, p.75-80 (April 1983). In German. Energy loss measurements on Co₅Sm thin films performed in a transmission setup reveal a broad, atypical plasmon at 15 eV and faint structure at about 5 eV. The latter is shown to disappear with decreasing grain size and is assumed to correspond to a transition in which (s,d)-hybridized states are involved. Wave number resolved measurements demonstrate that the plasmon peak disperses negatively, in contrast to the usual NFE plasmon behaviour. In order to explain this anomaly it is tentatively proposed that there exists a near lying interband transition, into which the plasmon is hybridized. (18 refs.)

- 77498** Scattering and surface recoiling TOF spectra of neutrals and ions from rare gas bombardment of Ge, GeO₂, and H₂O adsorbed on Ge. R.Kumar, J.A.Schultz, J.W.Rabalais (Dept. of Chem., Univ. of Houston, Houston, TX, USA). *Chem. Phys. Lett. (Netherlands)*, vol.97, no.3, p.256-60 (20 May 1983). TOF spectra of scattered primary and surface recoiled neutrals and ions for He⁺, Ne⁺, and Ar⁺ bombardment of Ge, GeO₂, and H₂O adsorbed on Ge are presented. Ion fractions are determined for scattered and recoiled particles and the role of scattering cross sections and surface charging effects on detection of recoiling hydrogen are considered. (18 refs.)
- 77499** Charge state-dependent effects in electronic sputtering by fast ions. N.E.B.Corn (Nuclear Phys. Div., AERE Harwell, Didcot, England). *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.1-2, p.1-6 (1983). Reported yields of ejecta sputtered from dielectric and organic materials by MeV/amu O and F ions show a strong dependence on the incident ion charge state. These observations are consistent with a (dE/dx)²-dependence of sputtering yield, provided that proper account is taken of the charge-state equilibration process as the ion beam enters the solid. From a knowledge of this process, an effective interaction depth for the coupling of electronic excitation to prompt sputtering is inferred to be ≤ 6 nm for the case of 1.24 MeV/amu O incident on glycylglycine. A somewhat smaller depth is inferred for uranium sputtered by 1 MeV/amu F incident on UF₄. (12 refs.)
- 77500** Computer simulation of the self-sputtering of uranium. M.T.Robinson (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2650-9 (May 1983). The sputtering of polycrystalline α -uranium by uranium ions of energies below 10 keV has been studied in the binary collision approximation using the computer simulation program MARLOWE. Satisfactory agreement of the computed sputtering yields with the small amount of available experimental data was achieved using the Moliere interatomic potential, a semilocal inelastic loss function, and a planar surface binding barrier, all with conventional parameters. The model is used to discuss low energy sputtering processes and the energy and angular distributions of the reflected primaries and the sputtered target particles. (27 refs.)
- 77501** Energy dependence of the sputtering yield of silicon bombarded with neon, argon, krypton, and xenon ions. P.C.Zalm (Philips Res. Labs., Eindhoven, Netherlands). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2660-6 (May 1983). Sputtering yields of Si were determined for bombardment with Ne, Ar, Kr, and Xe ions at normal incidence in the energy range 0.2-20 keV under ultrahigh vacuum conditions ($<10^{-7}$ Pa). Mass selection was employed and the energy spread was limited to a few electron volts. High fluences in excess of 10^{18} cm⁻² were used to obtain stationary state yields. A special method was adopted for the yield determination, involving accurate current integration and eroded crater volume measurement with a micromechanical stylus. As a spinoff of the adopted technique, relative sputtering yields for Mo could also be determined. The data agree with the sparse other recent experimental results. Discrepancies with older data sets are sizeable but can be attributed to improved beam definition and better surface conditions. The measured yields are, even quantitatively, in surprisingly good agreement with predictions from Sigmund's (1969) linear cascade theory in the low and intermediate energy range. At higher energy the yields fall off more rapidly than the

theory predicts, the deviations increasing with decreasing projectile mass. This behavior cannot be explained entirely in terms of the parameters and assumptions entering the Sigmund model. Various proposed empirical modifications and alternatives for Sigmund's theory are critically examined and a new quite useful simplification of the latter is derived. (24 refs.)

77502 Ion knock-on broadening effects in Auger sputter profiling studies of ultra-thin SiO_2 layers on Si. M.A.Taubenblatt, C.R.Helms (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2667-71 (May 1983).
Ultrathin layers of SiO_2 on Si (less than ~ 100 to 200 \AA) show a reduction in the measured width of the Si- SiO_2 interface when profiled using ion sputtering. Although previously attributed to the intrinsic properties of thin oxides or surface roughening due to ion-beam etching, this effect is predominantly caused by ion knock-on broadening or knock-on enhanced diffusion. It is important to realize that this effect is an artifact of the sputtering process, and not a property of the system under study. A model is developed based on the spatial distribution of the energy deposited by the sputtering ions to explain the observed reduction in measured interface width. This model is compared with interface widths obtained using Auger electron spectroscopy from identically grown thermal SiO_2 samples which have been thinned by chemical etching to eliminate oxidation kinetic effects. (13 refs.)

77503 Energy redistribution among internal states of nitric oxide molecules upon scattering from Pt(111) crystal surface. M.Asscher, W.L.Guthrie, T.-H.Lin, G.A.Somorjai (Dept. of Chem., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.11, p.6992-7004 (1 June 1983).
The internal states distributions rotation and vibration of nitric oxide molecules scattered from the Pt(111) crystal surface are reported. These distributions were measured as a function of crystal temperature (T_s) and scattering angles. The extent of equilibration of the three degrees of freedom, e.g. translation, rotation, and vibration with the metal surface is discussed in terms of the energy accommodation coefficients γ . It was found that $\gamma_{\text{trans}} > \gamma_{\text{vib}} < \gamma_{\text{rot}}$. A model is suggested to account for the cold rotational distribution of molecules scattered via a trapping desorption mechanism. The vibrational distributions are determined by kinetic effects and by the competition between vibrational excitation of the adsorbed molecules and their desorption. (31 refs.)

77504 Energy distribution of sputtered metastable Ca atoms. W.Husinsky, G.Betz, I.Girgis (Inst. für Allgemeine Phys., Tech. Univ. Wien, Wien, Austria).

Phys. Rev. Lett. (USA), vol.50, no.21, p.1689-92 (23 May 1983).
The energy distribution of sputtered metastable Ca atoms in the 3P_2 sublevel of the lowest-lying triplet state has been measured by Doppler-shift laser-fluorescence spectroscopy. The energy distribution was found to peak at values higher than known for sputtered ground-state atoms. No threshold energy has been found. With increasing oxygen partial pressure the flux of sputtered metastable atoms increased by an order of magnitude; however, the shape of the energy distribution remained unchanged. (26 refs.)

77505 Fundamental problems of the interaction of ions with insulators.

U.Littmark, K.Rössler (Inst. für Grenzflächenforschung und Vakuumphys., KFA Jülich GmbH, Jülich, Germany).
Radiat. Eff. (GB), vol.64, no.1-4, p.49 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Summary form only given, as follows. The special situation of insulators necessitates a discussion as to whether the classical collision theory which had mainly been developed for metallic systems still holds in ionic or covalently bound solids. Special problems which should be treated are: (a) changes in the interaction potentials due to the localization of electrons of the target atoms, (b) the influence of charge states of the projectiles, which due to slower neutralization processes, might be higher on the average in insulators than in metals, (c) the effect of specific structure, multielemental composition on the trajectories ('focusing'), (d) the importance of covalent binding of the molecular units, and (e) the energy loss via chemical interactions by formation of stable bonds at low kinetic energies and transient ones at higher energies ('chemical stopping'). These problems are treated by a comparison of experimental results with theory and computer simulation of collision cascades. (no refs.)

77506 Chemical sputtering, a discussion of mechanisms. H.F.Winters (IBM Res. Lab., San Jose, CA, USA).

Radiat. Eff. (GB), vol.64, no.1-4, p.79 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Summary form only given. The authors review the evidence for chemical sputtering and discuss mechanisms based on experimental information obtained for the chemical sputtering of silicon and SiO_2 under argon ion bombardment in the presence of a molecular beam of XeF_2 . Under these conditions, 25 or more silicon atoms can leave the surface per incident argon ion. About 75% of the silicon is emitted as SiF_4 (gas) and the rest leaves as silicon atoms or SiF_3 radicals. The total yield (silicon plus fluorine) is greater than 100 atoms/ion. The measured yields are a strong function of XeF_2 flux and a much weaker function of ion energy in the range 500-5000 eV. The chemical-sputtering yield for SiO_2 is smaller than that of silicon by about an order of magnitude, but it is still larger than the physical-sputtering yield. Moreover, SiO_2 is also sputtered by electrons. These results indicate that the incident radiation induces a chemical reaction between silicon and absorbed fluorine which produces SiF_4 , and the SiF_3 is subsequently desorbed into the gas phase. This process is defined as chemical sputtering. The large yields are probably a consequence of weak binding between the surface and the SiF_4 molecule. (no refs.)

77507 Sputtering of condensed noble gases by keV ions. R.Pedrys, R.A.Haring, A.Haring, F.W.Saris, A.E.de Vries (FOM Inst. for Atomic & Molecular Phys., Kruislaan, Amsterdam, Netherlands).

Radiat. Eff. (GB), vol.64, no.1-4, p.81 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Summary form only given, as follows. Layers of Kr and Xe condensed at $\sim 15\text{K}$ and 35K have been bombarded by $3\text{-}6 \text{ keV Ar}^+$, Kr^+ and Xe^+ ions. The sputtered neutrals were detected after a 1.43 m flight path by means of a mass spectrometer. Among the sputtered particles are considerable numbers of Van der Waals molecules, Kr_2 , Kr_3 , Xe_2 , XeKr and XeKr_2 . The energy distribution of the sputtered particles give clues to the sputtering mechanisms involved. (no refs.)

77508 Ion sputtering of minerals and glasses: a first step to the simulation of solar wind erosion. K.Thiel, U.Sassmannshausen, H.Kulzer, W.Herr (Inst. für Kernchemie, Univ. Köln, Köln, Germany).

Radiat. Eff. (GB), vol.64, no.1-4, p.83-8 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Selected rockforming minerals (plagioclase, augite, olivine, ilmenite, silicate and metal phases of the meteorite 'Brenham') as well as silicate and phosphate glasses were irradiated with heavy ion ($^4\text{He}^+$, $^{14}\text{N}^+$, $^{20}\text{Ne}^+$, $^{40}\text{Ar}^+$, $^{56}\text{Fe}^+$, Xe^+) in the energy range of 50-130 keV in order to study ion-induced sputtering. Sputtering yields were measured independently by means of multiple beam interferometry and particle track autoradiography. The theory of sputtering by Sigmund (1969) modified by Smith (1978), was used to convert experimental heavy ion sputtering yields to H^+ and He^+ -sputtering yields of the same target. Taking into account solar wind irradiation conditions at the lunar surface, an estimate of lunar erosion rates due to solar wind sputtering is given for the targets studied. (18 refs.)

77509 Catastrophic sputtering of sulfur by helium. D.Fink, J.P.Biersack (Hahn-Meitner-Inst. für Kernforschung Berlin, Berlin, Germany).

Radiat. Eff. (GB), vol.64, no.1-4, p.89-95 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
The sputtering yield of sulfur by $30\text{-}300 \text{ keV He}^+$ at 20°C was found to be of the order of 10^{10} sulfur atoms per incident ^4He , dependent on the energy and total implanted fluence, and independent of the ion flux onto the target. This effect may be explained by a weakening of the van der Waals binding between the S_8 rings due to Coulomb repulsion in the homogeneously charged volume, after a sufficient charge has accumulated in the highly insulating sample. Sulphur emission continues even for some time after the beam is switched off, and emission of sulfur atoms is also observed from non-irradiated areas adjacent to the irradiated spot, even from the rear side of 2-mm thick sulfur targets. (11 refs.)

77510 Sodium halide sputtering by H^+ , He^+ , Ar^+ ions. J.P.Biersack, E.Santner (Hahn-Meitner-Inst. für Kernforschung Berlin GmbH, Berlin, Germany).

Radiat. Eff. (GB), vol.64, no.1-4, p.97 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Summary form only given, as follows. Sputtering experiments were performed with 70 to 300 keV H^+ , He^+ and Ar^+ ions impinging on KCl, KBr and KI [sic]. The alkali halide samples are prepared as polycrystalline layers of about 2500 \AA thickness, deposited on carbon-aluminum backings. During the ion bombardment the targets are kept at elevated temperatures between 50 and 300°C , in order to study the temperature dependence of sputtering. During the irradiation the removal of halogen and sodium is simultaneously observed by Rutherford backscattering. The results indicate (i) preferential sputtering of the halogen atoms, (ii) temperature dependent sputtering yields with 0.2 eV activation energy, (iii) sputtering yields proportional to the electronic stopping power rather than the nuclear stopping power, and (iv) sputtering yields orders of magnitude higher than estimated by elastic collision cascade theories. These findings can be interpreted by a Pooley process with subsequent migration of the interstitial halogen atom to the surface. (no refs.)

77511 Ion-beam depth-profiling studies of leached glasses. C.A.Houser, I.S.Tsong, W.B.White (Materials Res. Lab., Pennsylvania State Univ., University Park, PA, USA), A.L.Wintenberg, P.D.Miller, C.D.Moak.

Radiat. Eff. (GB), vol.64, no.1-4, p.103-8 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Ion-beam depth-profiling was carried out on three different glasses leached (or hydrated) in deionized water using the $^{19}\text{F}(\text{p},\gamma)^{18}\text{O}$ nuclear reaction, secondary ion mass spectrometry (SIMS), and ^{18}O -induced photon spectrometry (SIPS) techniques. The depth-profiles show an interdiffusion mechanism in which the sodium ions in the glass are depleted and replaced by hydrogen (H^+) or hydronium (H_3O^+) ions from the solution. The leaching behavior does not show significant difference whether the glass surface is fractured or polished. Problems of mobile ion migration caused by ion bombardment and loss of hydrogen during analysis are discussed. (17 refs.)

77512 Sputtering of Al_2O_3 and LiNbO_3 in the electronic stopping region. Qiu.Yuanxun, J.E.Griffith, Tombrello. T.A. (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA).

Radiat. Eff. (GB), vol.64, no.1-4, p.111-16 (1982). [received: May 1983]
(Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).
Because of recent interest in the role played by the thermal properties of materials that exhibit high energy sputtering, the authors have sputtered Al_2O_3 and LiNbO_3 with chlorine ions at energies between 3 MeV and 25 MeV . To detect the sputtered Al and Nb they employ thin carbon catcher foils, which are analyzed with Rutherford scattering in the forward direction. Al surface densities of $10^{14}/\text{cm}^2$ and Nb surface densities of $10^{13}/\text{cm}^2$ are easily measured. The sputtering yields for both Al_2O_3 and LiNbO_3 increase rapidly with increasing chlorine energy, and the Al and Nb yields are both approximately 0.2 at 20 MeV . Tests for dose, beam current, and contamination effects will be discussed. (10 refs.)

77513 Angular distributions of Au and Cu atoms sputtered from Au-Cu alloys by keV Ar^+ ion bombardment. H.J.Kang, Y.Matsuda, R.Shimizu (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan).

Surf. Sci. (Netherlands), vol.127, no.3, p.179-85 (May 1983).
Angular distributions of Au and Cu atoms sputtered from Au-Cu alloys under 3 keV Ar^+ ion bombardment were measured to understand the preferential sputtering. The surface composition of sputter-deposited Au-Cu films on substrates mounted at different ejection angles was analyzed by Auger electron spectroscopy and electron probe microanalysis. Although the result indicated that the proportion of sputtered Cu atoms to the Au atoms in the Au-Cu alloy depends on the ejection angle, marked enhancement of the lighter component in the direction normal to the surface has not been observed in spite of the larger mass ratio of the constituent atoms of the Au-Cu alloy. (14 refs.)

77514 Computer simulations of ion scattering spectra for 2.4 keV Ne^+ incident on Ni(001). J.A.Yarmoff, R.S.Williams (Dept. of Chem. & Biochem., Univ. of California, Los Angeles, CA, USA).

Surf. Sci. (Netherlands), vol.127, no.3, p.461-86 (May 1983).
Monte-Carlo computer simulations of Buck's (1979, 1980) time-of-flight ion scattering spectroscopy data collected for 2.4 keV Ne^+ incident on a Ni (001) surface were used to examine the importance of various input parameters in the computational model. The binary collision approximation was found to yield satisfactory results for this particular projectile, energy, and target. The calculated energy spectra were quite sensitive to the screening length of the Moliere potential used for calculating the binary collision interactions and to the magnitude of the mean square vibrational amplitudes chosen for the Ni

atoms in the lattice. The agreement between the calculated and experimental spectra was good, but the calculations probably could have been improved a little further by fine tuning the parameters in the simulation. The simulations show that the ISS spectra for 2.4 keV Ne⁺ ion beam incidence directions along the [100] azimuth of Ni(001) were dominated by multiple scattering events and that the second layer of the surface contributed most to the backscattering because of the focusing effect of the first layer atoms. (36 refs.)

77515 Excitations in charge-transfer atom scattering. J.E.Inglesfield (Daresbury Lab., Sci. & Engng. Res. Council, Warrington, England). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.555-68 (May 1983). The electronic excitations are calculated for a tight-binding model of 25-1000 eV Na atoms scattering off W, assuming a classical trajectory for the Na atoms which interact with a single half-filled band on the substrate. The excitation spectrum consists of substrate electron-hole pairs at low energies, with a jump at the ionization threshold due to electron transfer from the Na to the W. If the Na ionization level crosses the Fermi energy beyond the range of hopping between the Na and the W substrate, the ionization probability is high. As the Na kinetic energy is reduced the ionization probability decreases, but the substrate electron-hole excitations increase in importance, and this is discussed in semi-classical terms. (14 refs.)

77516 Band structure effects in high energy ion beam surface interaction at grazing incidence. H.Winter, R.Zimny, A.Schirmacher, B.Becker, H.J.Andra (Inst. für Kernphys., Univ. Münster, Münster, Germany), R.Frohling. *Z. Phys. A (Germany)*, vol.311, no.4, p.267-80 (1983).

The analysis of charge state distributions after the interaction of fast Li- and N-ions with a surface at grazing incidence at energies between 50 and 350 keV yields for Li a strongly suppressed and for N an enhanced fraction of neutrals in comparison to the beam-foil interaction. These findings are supported by corresponding alkali-spectra which are dominated by lines from transitions in singly ionized atoms. The experiments are consistently interpreted in terms of a two step model: (1) collisional excitation in the close vicinity of the surface and (2) modification of this population by resonant electron transfer from (to) nonlocalized states in the conduction (valence) band to (from) the ion. The model is also applied to interpret recent beam-foil experiments where preferential populations of Rydberg levels in highly ionized atoms were found. (32 refs.)

79.40 THERMIONIC EMISSION

77517 General quantitative expression of the positive ionization efficiency in dissociative self-surface ionization of ionic crystals. H.Kawano (Dept. of Chem., Faculty of Sci., Ehime Univ., Matsuyama, Japan). *J. Chem. Phys. (USA)*, vol.78, no.11, p.7012-13 (1 June 1983). Positive ion emission occurs when thick polycrystalline layers of MX deposited on a metal surface are heated in vacuum. In various research fields, this phenomenon has been utilized as a simple method to generate ion beams from ionic crystals. Recent study has concluded that (1) the ion emission originates from 'dissociative self-surface ionization (DSSI)', (2) the layer surface is inhomogeneous with respect to work function, (3) the real surface area for the ion emission is much smaller than that for the neutral molecular evaporation, and also (4) the ionization efficiency is usually less than 10⁻⁴ thereby indicating that the degree of dissociation is smaller than unity. DSSI is investigated theoretically. (9 refs.)

79.60 PHOTOEMISSION AND PHOTOELECTRON SPECTRA

77518 Photoelectron emission from a platinum electrode into liquid ammonia solutions. F.A.Urbe, T.Sawada, A.J.Bard (Dept. of Chem., Univ. of Texas, Austin, TX, USA).

Chem. Phys. Lett. (Netherlands), vol.97, no.2, p.243-6 (13 May 1983). Photoelectron emission from a Pt electrode into liquid NH₃ under Ar-ion laser illumination at wavelengths corresponding to 2.41, 2.54, 2.71 and 3.41 eV is described. Plots of photocurrent (*i*) versus electrode potential (*V*) in the 'five-halves law' (*i*^{0.4} versus *V*) form show 'two-slope' plots that yield threshold potentials and electron injection levels. Based on these, an energy level diagram involving injection of electrons at energies 0.13-0.97 eV above the solvated electron level (which is -1.3 eV versus vacuum) is proposed. (16 refs.)

77519 Reply to 'Comment on 'X-ray photoelectron spectroscopic studies of oxygen chemisorption on thick films of photoconducting cadmium sulphide'. D.P.Amalnerkar, S.Badrinarayanan, S.K.Date, A.P.B.Sinha (Phys. Chem. Div., Nat. Chem. Lab., Pune, India). *J. Appl. Phys. (USA)*, vol.54, no.5, p.2881-2 (May 1983). For original paper see D.P. Amalnerkar et al., *Appl. Phys. Lett.*, vol.41, p.270 (1982). For comment see M. Lichtensteiger and C. Webb, *J. Appl. Phys.*, vol.54, p.2129 (1983). A thorough examination of the authors' experimental data revealed that the two additional photopeaks in question do not originate from indeterminate stray AlK_α radiation as suggested by Lichtensteiger and Webb, but are due to sulphur-oxygen species formed on the surface of CdS thick films. (8 refs.)

77520 A new method for determining relaxation energies by means of AES and XPS and its application to silicon compounds. F.Bechstedt, R.Enderlein (Sektion Phys., Humboldt-Univ. zu Berlin, Berlin, Germany), R.Fellenberg, P.Streubel, A.Meisel.

J. Electron Spectrosc.: & Relat. Phenom. (Netherlands), vol.31, no.2, p.131-43 (May 1983).

A new method is presented for the determination of the absolute dynamic relaxation energy *R_D* from experimental Auger parameters, the static dielectric constant and the plasmon energy of the solids. The relaxation energies of the Si 1s and 2p core levels in Si, SiC, SiO₂, Si₃N₄ and Na₂SiF₆ are investigated by comparing the experimental values with theoretical results from a semiempirical dielectric theory. Both the experimental and theoretical results are valid only for the least-bound Si 2p state. The calculated relaxation shifts $\Delta R_D^{(1s)}$ and $\Delta R_D^{(2p)}$ are in reasonable agreement with the experimental values, and describe the extraatomic polarization effect well also for a deep level. (31 refs.)

77521 Resonant photoemission from Si. K.L.I.Kobayashi (Central Res. Lab., Hitachi Ltd., Kokubunji, Tokyo, Japan), H.Daimon, Y.Murata.

Phys. Rev. Lett. (USA), vol.50, no.21, p.1701-4 (23 May 1983). Anomalous evolution of the silicon valence-band photoemission spectra is observed in the photon energy region from the 2p core-excitation threshold to about 3 eV above the threshold. The 3p-like topmost emission band shows a Fano-type resonance, and stronger intensity enhancement is observed in the deeper binding-energy region around 7.6 eV. The present results show the existence of a decaying localized core exciton at the 2p core-excitation threshold. (10 refs.)

77522 Far ultraviolet photoelectric study of thin SnSe evaporated films.

A.Bennouna (Lab. de Spectroscopie, CNRS, Univ. de Rennes 1, Rennes, France), P.Y.Tessier, M.Priol, Q.Dang Tran, S.Robin.

Phys. Status Solidi b (Germany), vol.117, no.1, p.51-6 (1 May 1983). Energy distribution curves of photoemitted electrons are obtained for SnSe thin polycrystalline films in the 10 to 40 eV energy range. The method of preparation of the sample under ultrahigh vacuum conditions is described and the synthesis of the initial material. The quality of the sample is checked by Auger analysis which reveals a weak reactivity of the material. The EDCs show structures appearing at 0.9, 2.1 to 2.7, 3.9, 7.4 eV below the top of the valence band. The Sn 4d levels are also investigated. The 4d(5/2) is found at 24.3 eV and the 4d(3/2) at 25.3 eV below the top of the valence band. Structures in the EDCs are compared with those of existing similar works and are interpreted by means of a theoretical bands scheme. (26 refs.)

77523 Spin- and angle-resolved photoemission from ferromagnetic Fe(001). R.Feder, W.Gudat, E.Kisker, A.Rodriguez, K.Schroder (Inst. für Festkörperforschung KFA Jülich, Jülich, Germany).

Solid State Commun. (USA), vol.46, no.8, p.619-23 (May 1983). For near-normal photoemission from ferromagnetic Fe(001) excited by linearly polarized synchrotron radiation, energy-resolved spin polarization and intensity distribution have been measured at 60 eV photon energy. Calculations using a one-step theory of photoemission consistently reproduce the present spin-resolved data as well as earlier spin-averaged measurements. The quasi-particle exchange splitting deduced from the data is 2 eV. The agreement with band structure calculations is suggested to be coincidental due to a compensation of real and imaginary self-energy corrections. (25 refs.)

77524 Photoemission of Xe and Kr adsorbed on the W(110) plane.

R.Opila, R.Gomer (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA). *Surf. Sci. (Netherlands)*, vol.127, no.3, p.569-97 (May 1983). The UPS and XPS spectra of Xe adsorbed on clean, O, CO, and Xe covered W(110) surfaces and the UPS spectrum for Kr on clean and O covered W(110) surfaces have been investigated. On clean W, Xe and Kr show a splitting of the 5p_{3/2} and 4p_{3/2} hole states respectively. For Xe the coverage dependence of this splitting was investigated in detail; neither the positions nor the intensity ratio of the substates are coverage dependent for $\theta \geq 0.04$, suggesting that splitting is due to differences in the image interaction of the $m_j = \pm 3/2$ and $m_j = \pm 1/2$ components. For Xe equal shifts, relative to vacuum, of ~1.0 eV were observed for 5p, 4d, and 3d levels suggesting that initial state effects are small. Image interaction for Xe and Kr on clean W could best be fitted by assuming an increase, rather than a decrease in the effective hole-image separation from the nominal value, suggesting that the image plane is moved back into the metal by a screening length. For Xe adsorbed on Xe/W(110) or on virgin-CO/W(110), polarization of the intermediate layers was found to contribute significantly to relaxation. Coadsorbed oxygen broadened Xe 5p and Kr 4p peaks. There was an almost linear relation. Coadsorbed oxygen broadened Xe 5p and Kr 4p peaks. There was an almost linear relation between O 2p UPS intensity at the energies of the various peaks and the amounts of broadening, suggesting that the latter results from resonance neutralization by electrons from the O 2p states. (33 refs.)

77525 Resonant photoemission and f-band dispersion in UIr₃. A.J.Arko, D.D.Koelling (Argonne Nat. Lab., Argonne, IL, USA), B.Reihl.

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.1-2. Angle-resolved and resonant photoemission techniques have been used to determine both the f-band dispersions and partial f-electron density in UIr₃. The results are compared to a self-consistent APW band structure calculation where the potential was included in the warped muffin-tin approximation. The photoemission measurements were performed with a two-dimensional display-type analyzer in both the angle-integrated ($\Delta\theta = 86^\circ$) and angle-resolved ($\Delta\theta = 6^\circ$) mode. (2 refs.)

77526 \tilde{A}, \tilde{P} effects in polar angle dependence of photoemission from Cu(001). R.L.Benbow, M.R.Thuler, Z.Hurych (Phys. Dept., Northern Illinois Univ., DeKalb, IL, USA), N.V.Smith, P.D.Johnson.

Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.4-5. Angle-resolved photoelectron spectra were collected in the plane of incidence for p-polarized light with angle of incidence $\sim 70^\circ$ from normal. The comparison of spectra obtained at equal angles from normal in the plane of incidence shows that the spectra may differ radically. In particular, the Cu conduction band is usually strong at polar angles $\theta \leq 25^\circ$ from normal on the side of normal toward which the light is reflected. At the same angle, but in the opposite sense from normal, the conduction band is generally seen to diminish and for certain polar angles and photon energies may disappear altogether. (3 refs.)

77527 Optical 4d excitation in a monolayer of Xe on Au. W.Eberhardt, A.Zangwill (Brookhaven Nat. Lab., Upton, NY, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.15-16. The authors measure the strength of the 4d core level Rydberg transitions in a monolayer of Xe adsorbed onto Au by monitoring the intensity of the Auger electron emission following the decay of the 4d hole created in the primary excitation. The data show that the oscillator strength in the Rydberg transition region is nearly identical to the equivalent transitions in gaseous or solid Xe and does not vanish as it was observed for the 5p-6s transition in the same system. (2 refs.)

77528 Photoemission does not measure the energies of orbitals (or: Configurational model of adsorbate structure and excitations). C.P.Flynn, J.E.Cunningham (Dept. of Phys. & Materials Res., Univ. of Illinois, Urbana, IL, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.17. The structure and excitation spectra of atoms adsorbed on metal surfaces are discussed with particular emphasis on the way the metal substrate influences ionic behavior. The authors present a configurational model which is useful for discussing photoexcitation of and photoemission from molecular adsorbates. The model accounts in a satisfactory way for the excited state configurational switching observed in synchrotron radiation investigations of the excitation spectra of rare gas atoms adsorbed on metal surfaces. By means of this model they also identify an unfortunately widespread misunderstanding of the way a metallic substrate influences the energies for photoemission from adsorbates. The model shows how molecular adsorbates develop dipole moments and strong bonding as the excited state switch condition is passed, as is observed experimentally. The emergence of these ground state properties may, however, be significantly less sharp than the excited state switching, owing to the influence of higher excited levels. (3 refs.)

77529 The bandstructure of CO on Cu(111); breakdown of the single particle picture. H.-J.Freund, W.Eberhardt (Brookhaven Nat. Lab., Upton, NY, USA), D.Heskett, E.W.Plummer. Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.19-20. Many body effects are known to cause shifts of core level photoemission lines to an apparently lower binding energy than calculated by a standard, single particle calculation. Actually, a sum rule exists that correlates the calculated value of the core binding energy with the intensity weighted average of the energy of all photoemission lines corresponding to ionization of the same core level. Therefore the larger the satellite intensities, the lower is the apparent binding energy of the main line. This sum rule has been verified experimentally by now for several molecular systems. The authors have used the system of CO chemisorbed on Cu(111) to study the effect of many body excitations on bandstructure measurements by angle resolved photoemission. In this adsorbate system the bands are strictly two dimensional therefore no ambiguity exists about the determination of the normal momentum component required in bulk bandstructure measurements. (2 refs.)

77530 The electronic structure of the Na_xWO_3 bronzes: a photoemission study. G.Hollinger, F.J.Himpel, N.Martensson, B.Reihl (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), P.Pertosa, J.P.Doumerc. Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.21. W4f, Na2p core-level spectra and valence band spectra are presented for a series of metallic Na_xWO_3 ($0.4 < x < 0.85$) bronzes, in the 20-130 eV photon energy range. From a comparison of experimental and theoretical conduction band densities of states, it is found that in the measured composition range the trends of the Rigid Band Model behavior are respected. Fano-type resonances in the 5d conduction band intensity have been observed at the $5p_{1/2}$ and $5p_{3/2}$ photoabsorption threshold for Na_xWO_3 as well as for ReO_3 , WO_2 , and W. The Na_xWO_3 bronze spectra exhibit a characteristic double resonance structure different from the simple resonance peaks measured for ReO_3 , WO_2 , and W. In contrast, the photoemission W4f spectra for the high x Na_xWO_3 and ReO_3 are apparently similar. The results could be related to a mixed valence character for the metallic bronzes revealed in the final state of the photoemission process. (no refs.)

77531 Photoemission studies of silicon surfaces, Si-metal interfaces, Si hydrogenation and Si oxidation. G.Hollinger, F.J.Himpel, R.J.Purtell, G.W.Rubloff, R.A.Pollak, P.S.Ho (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.22-3. Angle-integrated photoemission measurements have been performed on Si(111)-(2×1), Si(111)-(7×7), and Si(100)-(2×1) surfaces in the 20-120 eV photon energy range. Core-level binding energies and valence bands have been measured with high resolution (0.1-0.3 eV) and high accuracy on clean surfaces and metal (Pt, Pd, Ni), hydrogen- and oxygen-covered surfaces. By tuning the photon energy and, therefore, the electron escape depth, both chemical shifts and band bending effects have been observed. (no refs.)

77532 The transition from linear to spiked X-ray edge. D.Gibbs, T.H.Chui, J.E.Cunningham, C.P.Flynn (Dept. of Phys. & Materials Res., Univ. of Illinois, Urbana, IL, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.24-5. The authors have discovered a phenomenon which, they believe, has extremely important consequences for the understanding of the response of a Fermi liquid to a localized shock. It is well known that the alkali metals Na, K, Rb and Cs have outer core $np^6 \rightarrow np^5(n+1)s$ excitation spectra which start abruptly at threshold with a sharp edge. This is the 'X-ray edge' which has been related to the Fermi liquid response. There is a small overshoot or spike on each of these threshold shoulders. They have discovered that when one of these alkalis is alloyed into a second alkali as a dilute impurity, the spectrum takes this form only in certain cases. In other cases the core excitation spectrum increases linearly from zero at threshold, with no sign of a sharp edge. (no refs.)

77533 Synchrotron radiation photoemission as a probe for overlayers on compound semiconductor surfaces: GeGaAs(110). G.J.Lapeyre, P.Zurcher, J.Anderson, F.Cerrina, G.R.Williams, D.Frankel, J.C.Hermanson (Dept. of Phys., Montana State Univ., Bozeman, MT, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.33-4. The problem of determining the effects of overlayers on compound semiconductor surfaces has been approached by performing electronic structure studies with polarization-dependent angle-resolved photoemission (PARPES). The results indicate that the principal effect is shifts in the energies of the interband transitions associated with the substrate emission. The above is to be contrasted with the typical PES chemisorption study where one finds the principal effect to be new emission features derived from the orbitals of the chemisorbed species. In order to perform such studies one needs to first characterize the substrate emission by identifying the interband transitions. (no refs.)

77534 Angle-resolved photoemission study of the GaAs(100) surface and the Ge-GaAs(100) interface. L.G.Salmon, T.N.Rhodin (School of Appl. & Engng. Phys., Cornell Univ., Ithaca, NY, USA). Fifteenth Annual Synchrotron Radiation Users Group Conference (papers in summary form only received), Stoughton, WI, USA, 18-19 Oct. 1982 (Stoughton, WI, USA: Synchrotron Radiat. Center 1982), p.47-8. Heterojunction properties cannot be described adequately by traditional models based on bulk parameters. A more effective model must incorporate characteristics of the heterojunction interface. Important to the development of such a model is a study of the formation of a simple lattice-matched heterojunction interface, such as Ge-GaAs(100). The numerous reconstructions obtainable on GaAs(100) permit a controlled study of the effects of substrate surface structure on the interface. The formation of the Ge-GaAs(100) interface is studied from initial stages to an established heterojunction. Heterojunctions are formed on GaAs(100) surfaces which had been grown by molecular beam epitaxy. The epitaxial Ge layers were grown by MBE under UHV conditions at a substrate temperature at 350°C to obtain clean abrupt interfaces. The interfaces were studied in situ by angle-resolved photoelectron spectroscopy (ARPES) to determine electronic states, by LEED to indicate crystal structure, and by Auger spectroscopy to verify cleanliness and surface stoichiometry. (no refs.)

79.70 FIELD EMISSION AND FIELD IONIZATION

77535 Field emission fluctuation phenomena of potassium microcrystals on tungsten. I. Spectral density functions and flip-flop. T.Biernat (Inst. of Experimental Phys., Univ. of Wrocław, Wrocław, Poland), Ch.Kleint, R.Mclewski.

Surf. Sci. (Netherlands), vol.127, no.3, p.487-97 (May 1983). The field emission flicker noise technique has been applied to study dynamical properties of epitaxial potassium microcrystals on tungsten. Spectral density functions of the (111) region for temperatures between 78 and about 230K were obtained. Some preliminary observations of flip-flop behaviour of potassium crystals are presented and discussed. (26 refs.)

77536 Field emission fluctuation phenomena of potassium microcrystals on tungsten. II. Temperature dependence and simulation of noise properties. T.Biernat (Inst. of Experimental Phys., Univ. of Wrocław, Wrocław, Poland), Ch.Kleint.

Surf. Sci. (Netherlands), vol.127, no.3, p.498-512 (May 1983). For pt.I see *ibid.*, vol.127, p.487 (1983). The temperature dependence of the flicker noise of potassium microcrystals is described in terms of spectral densities, exponents of spectral density functions, knee frequencies, and noise activation energies. The results of a simulation procedure of the spectral properties and their temperature dependence by different Lorentzian functions are presented and discussed together with some autocorrelation functions obtained by Wiener-Khinchine transformation of the simulated spectra. The observed noise is thought to be due to fluctuations in shape of the crystal in the built-up state, changes in cluster size and premelting phenomena. (21 refs.)

77537 Multiphonon effects in field electron emission. M.Yu.Sumetskii (M.A. bonch-Bruевич Electrical Engng. Inst. of Communications, Leningrad, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.2003-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3513-15 (Nov. 1982). [received: May 1983]

It is known that in weak fields characterized by slowness of electron tunneling the dynamic coupling of an electron with lattice vibrations is very strong. Therefore, vibrations of surface atoms in field electron emission in sufficiently weak electric fields may result in multiphonon excitation of electrons and in a deviation of the current-voltage characteristic from the Fowler-Nordheim curve. The author determines under which conditions the current in question can be observed. (4 refs.)

79.75 EXOELECTRON EMISSION

77538 Exoelectron emission from surface states in a ferroelectric. A.M.Kostsov, A.S.Sidorkin, V.S.Zal'tsberg, S.P.Gribkov (Lenin Konsomol State Univ., Voronezh, USSR). *Sov. Phys.-Solid State (USA)*, vol.24, no.11, p.1952-3 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3436-8 (Nov. 1982). [received: May 1983]
The authors used a high-sensitivity method for detection of electrons with an open-type secondary electron multiplier and data-conversion apparatus to investigate thermally stimulated exoelectron emission in a 10^{-5} torr vacuum from cut surfaces of ferroelectric triglycine sulfate (TGS) single crystals in the temperature range 20-70°C. Electron emission was observed under conditions of linear heating and spontaneous cooling. The dependence of the emission current j_{em} from the surface of a TGS crystal on the temperature of the crystal when the heating rate was $v=0.01^{\circ}\text{C}/\text{sec}$ is shown; the results are given for two different samples. The thermally stimulated exoelectron emission appeared only during heating. It was not observed when the samples were cooled. A second heating at the same rate produced the effect only after intermediate exposure to air for ~ 200 h. Some sensitivity of the emission to contact with the atmosphere indicated that the surface electron states dominated the emission process. (4 refs.)

80.00 CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY

81.00 MATERIALS SCIENCE

77539 Correspondence analysis for describing the morphology of powders. Application to a commercial alumina powder. M.Deletter, F.Cambier, C.Lebud, M.R.Anseau (Centre de Recherches, Industrie Belge de la Ceramique, Mons, Belgium). *Acta Metall. (USA)*, vol.31, no.6, p.893-902 (June 1983).
The authors define a method which allows the shape of a whole set of different objects to be studied. The Fourier series allows the shape of each object to be quantified by a set of parameters. This information is gathered by 'correspondence analysis'. It allows points relative to the harmonics of the Fourier series and points relative to the objects that are taken into consideration, to be represented in the same space simultaneously. The projection of this set onto plans containing the maximum of information allows it to be visualized and maps to be obtained which are the shape pictures of the set of objects. As an example, the mathematical treatment is applied to a commercial alumina powder and the shape maps thus obtained are discussed. (10 refs.)
77540 Highlights of US Air Force metallurgical research programs. A.H.Rosenstein (Air Force Office of Sci. Res., Boiling Air Force Base, Washington, DC, USA). *J. Met. (USA)*, vol.35, no.3, p.64-73 (March 1983).
Presents highlights of current research programs sponsored by the US Air Force. These programs are aimed at better understanding of the basic metallurgical factors which affect strength, toughness, high-temperature performance and resistance to aggressive environments of materials required to operate near the limit of their capacities in aerospace applications. Results of these studies are presented in three areas: materials synthesis, processing science, and materials behaviour. (1 refs.)

81.10 METHODS OF CRYSTAL GROWTH AND PURIFICATION
(for physics of crystal growth, see 61.50C; for epitaxial growth methods, see 81.15)

77542 Preparation and properties of Fe-1.65 wt.%Cr single crystals. A.Gabasova, S.Kadeckova (Fyzikalni Ustav CSAV, Praha, Czechoslovakia). *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.197-205 (1983). In Czech.
The results of a study of growth conditions of Fe-1.65 wt.%Cr oriented single crystals and defects in the as-grown crystals are presented. It has been found that oxygen content of 100 to 170 wt.ppm has a pronounced effect on preparation of crystals with uniform grain size which is necessary for single crystal growth. The main defects in as-grown crystals are twin grains and dislocations. The average dislocation density is $\geq 10^7 \text{ m}^{-2}$. The stress-strain curves of Fe-1.65 wt.%Cr single crystals oriented in the middle of the unit triangle and tested in tension at room temperature are similar to those of pure iron, only the critical resolved shear stress being a little higher for the alloy. (16 refs.)
77543 Automatic system for regulation of radius of crystals. V.S.Leibovich, V.A.Sukharev, V.M.Shushkov. *Prib. & Sist. Upr. (USSR)*, no.3, p.17-18 (1983). In Russian. English translation in: *Sov. J. Instrum. & Control (GB)*
The system is used to regulate the characteristic dimension of a crystal within boundaries of phase changes (from crystalline to fluid or gaseous). It is based

on determination of crystal growth parameters. The dynamical model is described and the structure of regulator is illustrated. (3 refs.) J.K.S.

77544 Flat-plate solar array progress and plans. W.T.Callaghan (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.115-18
Technical progress in the areas of silicon feedstock refinement; large-area sheet formation; flat-plate module process sequence development, and engineering and environmental testing are discussed, in the context of a revised thrust developed by the US Department of Energy. The new thrust of FSA is directed toward higher-risk, longer-term-payoff work that emphasizes the assumption of those technological risks that industrial firms are not likely to finance in the effort to develop reliable, low-cost photovoltaic modules. (1 ref.)

Chemical transport of MnS and MnSe using HCl as a transporting agent See Entry 77883

81.10D Growth from solutions

77546 Hydrogen uranyl arsenate hydrate single crystals: $\text{H}_2(\text{UO}_2)_2(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$: gel growth and characterization. E.Manghi, G.Polla (Dept. de Fisica, CNEA, Buenos Aires, Argentina). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.606-14 (April-May 1983).
Single crystals of hydrogen uranyl arsenate hydrate (HUAsH) were grown in tetramethoxysilane gels at different temperatures, below and above the paracelsite-ferroelastic transition temperature, T_0 . The crystals were characterized by X-ray diffraction, chemical etching, scanning electron microscopy and optical microscopy. The habit of the gel grown crystals allowed the three-dimensional features of the domain structure to be studied for the first time. A correlation was made between crystal perfection, domain structure and growth history. (14 refs.)
77547 Reconstruction by multidirectional holographic interferometry of the concentration field in a supersaturated solution near a growing NaClO_3 crystal. F.Bedarida, L.Zefiro, P.Boccacci (Istituto di Mineralogia, Genova Univ., Genova, Italy), C.Pontiggia. *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.641-4 (April-May 1983).
A real three-dimensional map of the concentration changes in a supersaturated solution around a growing crystal has been obtained by multidirectional holographic interferometry. This technique is a sort of optical tomography, since it gives the concentration field at different levels in the solution. (4 refs.)
77548 Growth of single crystals of hexagonal boron nitride. T.Ishii, T.Sato (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.689-90 (April-May 1983).
Single crystals of hexagonal boron nitride were prepared with Si flux. A mixture of Si and B powders was heated above 1850°C in a crucible made of hexagonal boron nitride under a N_2 atmosphere for 2 h. The largest crystals were about 2 mm in plane dimension and 20 μm in thickness. The large plane of the crystals was perpendicular to the c-axis. (6 refs.)
77549 Growth of single crystals from solutions using semi-permeable membranes. A.J.Varkey, C.E.Okeke (Dept. of Phys. & Astron., Univ. of Nigeria, Nsukka, Nigeria). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.701-4 (April-May 1983).
Using this technique single crystals of copper sulphate, potassium bromide and ammonium dihydrogen phosphate have been successfully grown. Advantages of this technique over other methods are discussed. (10 refs.)
77550 Characterization of flux-grown $\text{Ca}(\text{WO}_4)_x(\text{MoO}_4)_{1-x}$ crystals. S.K.Arora, R.S.Godbole, G.S.Trivikrama Rao (Dept. of Phys., Sardar Patel Univ., Gujarat, India). *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.321-3 (May 1983).
Crystals of $\text{Ca}(\text{WO}_4)_x(\text{MoO}_4)_{1-x}$, in the range $x=0.072$ to 0.86 were successfully grown by the flux technique. Neither the densities of the mixed crystals nor the cell parameters vary linearly. The dislocation density of the mixed crystals, determined by the etching technique, is greater than that of the end partners. The variation in microhardness of the mixed configurations is found to be linear and has no correlation with their dislocation content. (11 refs.)
Spectroscopic properties of TbP_2O_7 , TbLiP_2O_7 , and $\text{TbAl}_2(\text{BO}_3)_4$ See Entry 77426

81.10F Growth from melts

77551 Temperature profile and thermal stress calculations in GaAs crystals growing from the melt. M.Duseaux (Lab. d'Electronique et de Phys. Appl., Limeil-Brevannes, France). *J. Cryst. Growth (Netherlands)*, vol.61, no.3, p.576-90 (April-May 1983).
Temperature and thermal stress distributions are analyzed here for two kinds of crystal growth techniques: the LEC (Liquid Encapsulated Czochralski) method, and the LEK (Liquid Encapsulated Kyropoulos) method. The influence of the crystal diameter has especially been studied. The stress values reach 4 kg mm^{-2} near the B_2O_3 -argon interface in 50 mm diameter Czochralski crystals and 1-2 kg mm^{-2} in 15 mm crystals. In the case of the LEK procedure, the stress level is lower, especially in long and flat top crystals. It is shown that this level is not affected by the crystal diameter. (25 refs.)

77552 Effect of variable thermal conductivity on isotherms in Bridgman growth. R.J.Naumann, S.L.Lehoczky (Space Sci. Lab., NASA/Marshall Space Flight Center, Huntsville, AL, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.707-10 (April-May 1983). A change in thermal conductivity associated with melting or solidification can have a profound influence on the isotherms near the solidification interface if the material is being directionally solidified in an ampoule whose walls carry a substantial portion of the heat. This analysis was prompted by a recent discovery that the thermal conductivity of $Hg_{1-x}Cd_xTe$ increased dramatically as the material is heated above the solidus curve. An illustrative example is shown in which the sample is approximated as an infinite cylinder with constant but different thermal properties in the solid and melt. The boundary conditions are fixed on the surface by a conductive ampoule in a two-zone Bridgman furnace with an adiabatic region separating the two zones. The effect of the adiabatic zone in this case is to intensify the curvature of the interface rather than to lessen it. (10 refs.)

77553 Crystal growth of solid solutions $La_{1-x}Ba_xF_{3-x}$. A.Roos (Solid State Dept., Utrecht Univ., Utrecht, Netherlands). *Mater. Res. Bull. (USA)*, vol.18, no.4, p.405-9 (April 1983). Single crystals of solid solutions $La_{1-x}Ba_xF_{3-x}$ ($0 < x \leq 0.104$) have been grown by means of a modified Stockbarger method using RF heating. All crystals appeared to be single phase with the $LaF_3(P3c1)$ structure. The quality of the crystals depends strongly on the growth rate. The crystals are transparent from 11 μm to 0.33 μm . (9 refs.)

77554 Directional solidification of silicon in carbon crucibles by an Oscillating Crucible Technique. T.Daud (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), K.A.Dumas, G.H.Schwuttke, P.Smetana, K.M.Kim.

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.63-7

To increase quality of cast silicon ingots a new method of directional solidification called the oscillating crucible technique (OCT) is developed. During growth, a carbon crucible is oscillated to provide for effective stirring of the melt. This growth technique (seeded growth only), along with material characterization and solar-cell fabrication and testing, is described. Solar-cell efficiencies of up to 13% at 100 mW/cm² are obtained in the single crystalline areas. Minority-carrier diffusion lengths exceeding 100 μm are measured even in the polycrystalline areas of the wafers. Limitations of the present setup and possible future improvements are discussed. (13 refs.)

77555 Advanced crystallization techniques of 'solar grade' silicon. M.Gasparini (Heliosil SpA, Milano, Italy), C.Calligaris, P.Rava, L.Sardi, M.Alessandri, F.Redaeli, S.Pizzini.

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.74-9

Microstructural, electrical and photovoltaic characteristics of polycrystalline silicon solar cells fabricated with silicon ingots containing 5, 100 and 500 ppmw iron are reported and discussed. All silicon ingots were grown by the directional solidification technique in graphite or special quartz moulds and doped intentionally with iron, in order to evaluate the potentiality of the DS technique when employed with solar silicon feedstocks. Results indicate that structural breakdown limits the amount of the ingot which is usable for solar cells fabrication, but also that efficiencies in excess of 10% are obtained using the 'good' region of the ingot. 77556 Progress in growth of silicon ribbon by a low angle, high rate process. D.N.Jewett, H.E.Bates, J.W.Locher (Energy Materials Corp., Lancaster, MA, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.86-9

Substantial progress has been achieved in the development of the Low Angle Silicon Sheet (LASS) crystal growth technique since its inception in mid 1979. Continuously grown ribbons of 10 to 30 meters are produced routinely at growth rates of 10 to 80 cm/min. Ribbon widths are 4 to 15 cm and thickness varies from 0.3 to 0.6 mm with 0.5 mm typical. At an average growth speed of 30 cm/min and a width of 15 cm, productivity of 450 cm²/min of ribbon has been demonstrated. (3 refs.)

77557 Large area silicon sheet produced by the spinning method. Y.Maeda, T.Yokoyama, I.Hide (Res. Labs., Hoxan Corp., Sapporo, Japan).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.133-6

Polycrystalline silicon sheets having a 6-in., 4-in. dia. or 100 mm×100 mm with a thickness of 0.3-0.4 mm have been obtained directly by spinning the silicon melt dropped on a plate. Production time of sheet formation from the melt is about one second per sheet. The crystallites of the sheet have columnar structures. Material loss in the production process is little or none because of a clean recovery of the surplus silicon. Using this sheet, p-n junction solar cells with an AMI efficiency of 6.1% have been made experimentally. (5 refs.)

77558 In situ purification growth of undoped semi-insulating GaAs single crystals. T.Fukuda, K.Terashima, H.Nakajima (Optoelectronics Joint Res. Lab., Kawasaki, Japan).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.23-9

A new in situ melt purification growth technique to obtain undoped semi-insulating GaAs single crystals, with high reproducibility, has been developed. Undoped semi-insulating <100> crystals were grown by a computer controlled LEC technique linked with a new technique, in which melt purification was carried out by a special distillation process and the degree of purity was analysed by measurement of the electrical conductivity of the melt. Highly homogeneous undoped semi-insulating crystals, 2 inches in diameter, of resistivity 2×10^8 ohm cm, and low EPD, 8×10^7 /cm² were grown. (8 refs.)

77559 Zone-melting recrystallization of polycrystalline silicon films on fused silica substrates using RF heated carbon susceptor. Y.Kobayashi, A.Fukami, T.Suzuki (Hitachi Res. Lab., Hitachi Ltd, Ibaraki, Japan). *IEEE Electron Device Lett. (USA)*, vol.EDL-4, no.5, p.132-4 (May 1983).

High-quality recrystallized silicon films on fused silica substrates have been produced with a new micro-zone-melting method using an RF heated carbon susceptor. In this method, the fused silica substrate, on which a 0.5 to 1.0- μm -thick polycrystalline silicon film encapsulated with a 1.2- μm -thick CVD SiO_2 layer has been deposited, is moved across the carbon susceptor surface, which has a narrow-strip high-temperature zone. Recrystallized silicon films with (100) texture and elongated grains several tens times several hundreds of microns in size have been obtained. n-channel MOSFETs fabricated with these films exhibit surface electron mobilities as high as 700 to 1000 cm²/Vs. (10 refs.)

77560 A new method for the growth of circular nickel crystals by zone melting. S.Hayashi, S.Ono, H.Komatsu (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.698-700 (April-May 1983).

A new method has been established for the growth of circular nickel crystals by floating-zone melting. The as-grown crystals were single crystalline and their growth direction rotated continuously with the mechanical rotation. It was found from these results that the nickel grows equally along all crystallographic directions. (6 refs.)

77561 Preparation of bulk alloys of III-V compounds. E.M.Swiggard, R.L.Henry, H.Lessoff (Naval Res. Lab., Washington, DC, USA).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.1-5

A crystal growth technique for preparing radially and longitudinally homogeneous bulk crystals of III-V alloys has been developed. The technique is a zone leveling procedure with special features that make it possible to prepare homogeneous alloys of materials that have high vapor pressures at their melting point. The equipment is a horizontal pressure vessel capable of being operated at pressures up to 50 atmospheres. The growth technique is a liquid encapsulated procedure using boric oxide with provision for in-situ removal of the boric oxide before cooling. (1 ref.)

77562 Solid-phase lateral epitaxy of chemical-vapor-deposited amorphous silicon by furnace annealing. Y.Kunii, M.Tabe, K.Kajiyama (Electrical Communication Labs., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

J. Appl. Phys. (USA), vol.54, no.5, p.2847-9 (May 1983).

A single-crystalline silicon-on-insulator structure has been fabricated with solid-phase lateral epitaxy. Chemical-vapor-deposited amorphous silicon (CVD a-Si) deposited on a SiO_2 stripe is crystallized by furnace annealing. A new CVD technique (clean CVD) has met the conditions required for solid-phase epitaxy; clean interface and reduction of impurities and microcrystallites in the a-Si film. In the case of a 4- μm -wide SiO_2 stripe parallel to the (100) direction, the entire deposited layer grows epitaxially by low-temperature furnace annealing (550~650°C). In the case of a 10- μm -wide SiO_2 stripe, the whole surface region also grows epitaxially, although the deep region partially becomes polycrystalline in areas distant from the open substrate surface. The grown-layer crystallinity is improved by subsequent high-temperature annealing. (7 refs.)

77563 Preparation and magnetic characteristics of garnet films with cylindrical magnetic bubbles in the submicron range. V.M.Dmitruk, A.M.Zyuzin, A.M.Prokhorov, V.V.Randoshkin, V.I.Smokin, Yu.V.Starostin, M.I.Timoshchuk (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USSR)*, vol.27, no.7, p.573-4 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.63-5 (July 1982). [received: April 1983]

The purpose of this work was to develop apparatus for growing high-quality crystals of neodymium-gallium garnet, producing uniform epitaxial films of ferrite-garnets with submicron cylindrical magnetic bubbles, and optimizing their parameters. (5 refs.)

77564 Structural and optical properties of sprayed $CuInSe_2$ films. O.P.Agnihotri, P.Raja Ram, R.Thangaraj, A.K.Sharma, Atul Raturi (Phys. Dept., Indian Inst. of Technol., New Delhi, India).

Thin Solid Films (Switzerland), vol.102, no.4, p.291-7 (29 April 1983).

p-CuInSe₂ thin films with the chalcopyrite structure were prepared by spray pyrolysis. The films were characterized by X-ray diffraction, optical transmission, transmission and scanning electron microscopy and electrical measurements. They were found to have a preferred orientation with (112) parallel to the substrate. The resistivity of these films was varied from 0.1 to about 100 Ω cm by varying the Cu:In ratio from 1.2 to unity. (24 refs.)

77565 Thin-film epitaxial solar cells on substrates made from MG silicon by the HEM process. C.P.Khattak, F.Schmid (Crystal Systems Inc., Salem, MA, USA), P.H.Robinson, R.V.D'Aiello. Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.128-32

Describes progress made in applying the Heat Exchanger Method (HEM) in the direct solidification of commercially available metallurgical grade (MG) silicon for the fabrication of substrates suitable for the epitaxial growth of solar-cell structures. Attention is focused on the problem of SiC particle formation, its relationship to the starting MG feedstock, the characteristics of particle distribution in the ingots, and the effects of potential solar-cell yield. Methods are described for significantly reducing particles including proper selection of commercial MG feedstock, modifications and in-situ purifications added to the basic HEM process. After the introduction of these changes, quantitative estimates of ingot utilization and epitaxial solar-cell performance are given. Best solar-cell results were 12% on 4 cm², and 10.7% on 10 cm² area cells. (12 refs.)

81.15C Deposition by cathodic sputtering

77566 Production methods and properties of diamond-like carbon films. A.V.Balakov, E.A.Konshina.

Sov. J. Opt. Technol. (USA), vol.49, no.9, p.591-9 (Sept. 1982). Translation of: *Opt.-Mekh. Prom-st. (USSR)*, vol.49, no.9, p.52-9 (Sept. 1982).

Methods of obtaining carbon films having diamond-like properties, based on ion-plasma techniques, are reviewed. There are two main development trends that can be identified: ion sputtering of graphite and hydrocarbon destruction. The effect of the deposition conditions on the structure and phase composition of the films is analyzed. The microscopic and macroscopic properties of the carbon films and some of their technical applications are examined. (49 refs.)

77567 Microstructure trends in metal/aluminum, copper, indium, lead, tin-metal oxide thin films prepared by reactive ion beam sputter deposition. S.Nakahara, A.F.Hebard (Bell Labs., Murray Hill, NJ, USA).

Thin Solid Films (Switzerland), vol.102, no.4, p.345-60 (29 April 1983).

Transmission electron microscopy has been used to study the microstructural trends of thin film composites prepared by sputtering of a metal (aluminum, copper, indium, lead or tin) target with argon ions in the presence of a reactive gas (oxygen). Results of these studies reveal that there is a general progression in the metal component microstructure which correlates with an increasing metal oxide component in the films and can be classified as belonging to an agglomerated-columnar-granular-amorphous sequence. These structural trends and the concomitant effect on film properties, such as resistivity, adhesion and mechanical stability, are a direct consequence of the metal-metal oxide interaction and the inhibiting effect which the native metal oxides have on metal atom diffusion during film formation. (30 refs.)

77568 Thin film field effect transistors incorporating hydrogenated amorphous silicon produced by r.f. magnetron sputtering. M.C.Abdulrida, J.Allison (Dept. of Electronic & Electrical Engng., Univ. of Sheffield, Sheffield, England).

Thin Solid Films (Switzerland), vol.102, no.4, p.L43-6 (29 April 1983).

The authors report on thin film FETs incorporating a-Si:H prepared by r.f. magnetron sputtering, which have an ON-OFF current ratio of better than 10⁴ with applied gate voltages V_g of around 10 V. The midgap density of states in the a-Si:H is less than 10¹⁷ eV⁻¹ cm⁻³, as derived from field effect data following Spear and LeComber (1972). These results and other measured characteristics of the magnetron-sputtered a-Si:H, together with the performance of the related FETs, particularly the transfer and drain characteristics, are similar to those for glow discharge material and associated devices. 77569 Crystallization of amorphous mercury selenide films. K.N.Sharma, K.Barua (Dept. of Phys., Dibrugarh Univ., Dibrugarh, India).

Indian J. Pure & Appl. Phys., vol.21, no.2, p.116-18 (Feb. 1983).

The crystallization of amorphous mercury selenide (a-HgSe) films has been studied as a function of annealing temperature (343K<T<365K). The crystallization process was found to be gradual, which took place at any finite temperature and was thermally activated with an activation energy of 0.963 eV. The characteristic time associated with the microscopic reaction between the neighbouring atoms was 1.273×10⁻¹⁰ s. (10 refs.)

77570 Incorporation rates of gallium and aluminum on GaAs during molecular beam epitaxy at high substrate temperatures. R.Fischer, J.Klem, T.J.Drummond, R.E.Thorne, W.Kopp, H.Morkoc, A.Y.Cho (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).

J. Appl. Phys. (USA), vol.54, no.5, p.2508-10 (May 1983).

Gallium arsenide, aluminum arsenide, and aluminum gallium arsenide epitaxial layers were grown by molecular beam epitaxy in the substrate temperature range 590-720°C. The incorporation rates of Ga and Al in this temperature range were studied by means of thickness measurements. The growth rates of GaAs and Al_{0.3}Ga_{0.7}As were observed to be dependent on growth temperature above 640°C while the AlAs growth rate was observed to be independent of growth temperature in the range investigated. The reduction of the GaAs growth rate at a growth temperature above 640°C was found to be lessened by the presence of minute amounts of Al and excess As. For the fixed Ga flux and a growth temperature of 700°C the GaAs growth rate and the Ga contribution to the growth rate of Al_{0.3}Ga_{0.7}As were 0.50 and 0.89 times their low temperature values, respectively, while at 680°C these values were 0.88 and 0.99, respectively. (7 refs.)

77571 Growth of high quality Ge MBE film. Y.Ota (Bell Labs., Reading, PA, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.431-8 (April-May 1983).

Germanium single crystal films were grown on a germanium substrate by MBE technique in an ultra-high vacuum. The epitaxial growth was carried out on a p⁺ (ρ≤0.002 Ω cm), (100) or (111) Ge substrate at a growth temperature ranging from 600 to 920°C. The X-ray diffraction pattern and dislocation etching revealed that the epitaxial films were high-quality single crystal with low density of crystalline defects if the growth was carried out under proper conditions. The films had a bulk-like electrical property and a p-n junction mesa diode fabricated showed an excellent diode characteristic. (28 refs.)

81.15H Chemical vapour deposition

77572 Fabrication of GaAs-Mo-Si structures by metalorganic chemical vapor deposition and laser annealing. K.Okamoto, T.Imai (Univ. of Electro-Communications, Tokyo, Japan).

Appl. Phys. Lett. (USA), vol.42, no.11, p.972-4 (1-June 1983).

Undoped-polycrystalline GaAs layers were deposited on Mo layers by metalorganic chemical vapor deposition and annealed by pulse laser irradiation. The laser used here was a Q-switched ruby laser and the annealing was done by immersing the samples in SnCl₄-dissolved methanol. Then, recrystallization and doping of the GaAs layers were successfully done. The Schottky characteristics were observed between the top GaAs layer and the Mo layer underneath; the barrier height was 0.53 eV. (7 refs.)

77573 A comparison between InP films growth by the hydride and chloride techniques. K.A.Jones (Electrical Engng. Dept., Colorado State Univ., Fort Collins, CO, USA).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.525-34 (April-May 1983).

The differences and similarities in the properties of InP films growth by the hydride and chloride techniques are attributed to thermodynamics or kinetic effects. The primary difference in the source zone is that an InP⁺ crust is formed in the chloride system. It is suggested that the crust does not completely cover the liquid indium, and that the change in the background carrier concentration when the PCl₃ flow rate is altered is due to transient behavior between two steady state conditions. The larger background carrier concentration in the hydride grown films is partially attributed to a lower HCl concentration; the growth of p-type films in the chloride system by introducing PCl₃ downstream cannot be explained thermodynamically and the larger growth rates in the hydride system must be due to kinetic factors such as the slow decomposition of PH₃. (20 refs.)

77574 Reactive pulse plasma crystallization of TiN layers on substrates at 500K. A.Michalski, Z.Romanowski (Inst. of Materials Sci. & Engng., Warsaw Tech. Univ., Warsaw, Poland).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.675-80 (April-May 1983).

Compact, up to a few tenths of micrometers thick TiN_{0.9} layers having a Vickers microhardness of μHV₂₀=1600 and which showed protective antiwear properties for abrasive tools were deposited on steel at 500K. TEM observations of the first crystallization stages showed the nucleation of nearly monodisperse, small (d≈15 nm) TiN_x particles in the plasma as well as their migration on carbon substrate films even at 500K. The TEM observations may explain the mechanism of material crystallization of high melting layers from a pulse plasma. (11 refs.)

77575 The growth of epitaxial InP by the chloride process in nitrogen and in the presence of phosphine. P.L.Giles, P.Davies, N.B.Hasdell (Allen Clark Res. Centre, Plessey Res. (Caswell), Caswell Ltd., England).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.695-7 (April-May 1983).

Following the growth of epitaxial GaAs in the Ga/AsCl₃N₂ system, the authors have demonstrated that the growth of epitaxial InP in the equivalent In/PCl₃/N₂ system, under similar conditions, is not possible and possible thermodynamic reasons for this are suggested. With the addition of small amounts of phosphine, InP growth is possible in nitrogen and similar phosphine additions to the In/PCl₃/H₂ system produce dramatically increased growth rates. (12 refs.)

77576 Modelling of GaAs growth in the low pressure halide transport system. E.Veuhoff, N.Putz, J.Korec, M.Heyen, P.Balk (Inst. of Semiconductor Electronics, Aachen, Germany).

J. Electron. Mater. (USA), vol.12, no.2, p.235-46 (March 1983).

The authors discuss the application of an earlier proposed model to GaAs growth in the HCl-Ga-AsH₃-H₂ system at hydrogen pressures in the range 10⁻²-10³ Pa. The model takes into account the kinetic steps of gas phase diffusion, adsorption of the various species from the gas phase on the crystal surface and the chemical reaction itself, which produces the material to be deposited. A good quantitative description of the dependence of growth rate on hydrogen pressure, growth temperature, and input pressures of HCl and AsH₃ is obtained. The model leads to a better understanding of the growth mechanism and allows proper choice of the deposition parameters in order to obtain optimum material characteristics. (15 refs.)

77577 Low pressure metalorganic chemical vapor deposition on InP and related compounds. M.Razeghi, M.A.Poisson, J.P.Larivain, J.P.Duchemin (Thomson-CSF, Domaine de Corbeville, Orsay, France).

J. Electron. Mater. (USA), vol.12, no.2, p.371-95 (March 1983).

The low pressure metalorganic chemical vapor deposition epitaxial growth and characterization of InP, Ga_{0.47}In_{0.53}As and Ga_{0.47}In_{0.53}P_{1-y} lattice-matched to InP substrate are described. The layers were found to have the same etch pit density (EPD) as the substrate. The best mobility obtained for InP was 5300 cm² V⁻¹ S⁻¹ at 300K and 58900 cm² V⁻¹ S⁻¹ at 77K and for GaInAs was 11900 cm² V⁻¹ S⁻¹ at 300K, 54600 cm² V⁻¹ S⁻¹ at 77K and 90000 cm² V⁻¹ S⁻¹ 2K. The authors report the first successful growth of a GaInAs-InP superlattice and the enhanced mobility of a two dimensional electron gas at a GaInAs/InP heterojunction grown by LP-MO CVD. LP MO CVD material has been used for GaInAsP-InP, DH lasers emitting at 1.3 μm and 1.5 μm. These devices exhibit a low threshold current, a slightly higher than liquid phase epitaxy devices and a high differential quantum efficiency. (29 refs.)

77578 The production of high quality polysilicon film in the semiconductor devices and its detecting method. Wei Xiwen, Ma Lingzhi, Niu Defang (Dalian Inst. of Technol., Dalian, China).

J. Dalian Inst. Technol. (Dalian Gongxueyuan Xuebao) (China), vol.21, no.4, p.181-5 (Dec. 1982). In Chinese. [received: June 1983]

Introduces how to produce high quality polysilicon film in semiconductor devices and how to monitor the deposition temperature at the same time as the film grows. With the help of a high-precision semiconductor flowmeter the reaction gas and carrier gas flow are measured. (4 refs.)

77579 Effect of deposition parameters on the microstructure of chemically vapour-deposited SnO₂ films. N.Srinivasa Murty, S.R.Jawalekar (Dept. of Electrical Engng., Indian Inst. of Technol., Bombay, India).

Thin Solid Films (Switzerland), vol.102, no.4, p.283-9 (29 April 1983).

Transparent electrically conducting tin oxide films were deposited onto Pyrex glass substrates by oxidation of SnCl₂. The deposition temperature was in the range 400-500°C and oxygen with a flow rate of 1.35-2.50 l min⁻¹ was used as both the carrier gas and the oxidizing agent. Scanning electron microscope studies of these films indicate that the mean grain size varies from 0.083 to 0.303 μm. It was found that the film uniformity and the mean grain size increase with increasing deposition temperature and decreasing oxygen flow rate. This behaviour is explained in terms of the deposition rate, surface mobility and grain growth rate. SnO₂ films deposited at a high temperature (500°C) with a low oxygen flow rate (1.35 l min⁻¹) are uniform with a large mean grain size (0.303 μm). Doping SnO₂ films with antimony to 4 mol.% does not affect the film microstructure. (11 refs.)

77580 Investigation of crystallographic properties of thin germanium crystals grown on silicon substrates by chemical vapor deposition. H.Aharoni (Dept. of Electrical Engng., Ben Gurion Univ. of the Negev, Beer-Sheva, Israel), D.Durembergova.

Thin Solid Films (Switzerland), vol.102, no.4, p.327-43 (29 April 1983).

The quality of germanium crystals deposited from the gas phase by chemical vapor deposition using pyrolytic decomposition of GeH₄ in a helium atmosphere at various growth temperatures on silicon substrates was determined. X-ray diffraction and rocking curve measurements proved to be very useful in determining the degree of preferred orientation of the germanium deposit, since they distinguish clearly between the reflections of the thin germanium deposited layer and those of the thick silicon substrate. Therefore they permit fairly accurate calculations. Laue measurements, in this case, proved to be unsatisfactory because of inadequately low resolution. The results show that a preferred orientation of germanium crystallites in the layer of up to 99.9% was reached. (14 refs.)

77581 Efficiency of the SiH₄ oxidation reaction in chemical vapour deposition of SiO₂ films at low temperature. C.Cobianu, C.Pavelescu (Microelectronica, Bucharest, Rumania).

Thin Solid Films (Switzerland), vol.102, no.4, p.361-6 (29 April 1983).

Evaluates the efficiency of the SiH₄ oxidation reaction in the heterogeneous low temperature chemical vapour deposition (CVD) of SiO₂ films onto wafers at atmospheric pressure in SiH₄-O₂-N₂ systems as a function of the CVD conditions. The authors obtained an increase-maximum-decrease type of dependence of the reaction efficiency on the [O₂]/[SiH₄] mole ratio with temperature as a parameter, in the temperature range 200-400°C. At a given [O₂]/[SiH₄] mole ratio the reaction efficiency increases with temperature. These results are qualitatively explained in terms of the bimolecular surface reaction theory and of the dependence of the film density on the CVD conditions. A reactor figure of merit is defined to compare the reaction efficiency on wafers for different CVD reactors. (16 refs.)

77582 A low-cost polysilicon process based on the synthesis and decomposition of dichlorosilane. J.R.McCormick, F.Plahutnik, D.Sawyer, A.Arvidson, S.Goldfarb (Hemlock Semiconductor Corp., Hemlock, MI, USA).

Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.57-62.

Major process steps of a dichlorosilane based chemical vapor deposition (CVD) process for the production of polycrystalline silicon have been evaluated. While an economic analysis of the process indicates that it is not capable of meeting JPL/DOE price objectives (\$14.00/kg in 1980 dollars), product price in the \$19.00/kg to \$25.00/kg range may be achieved. Product quality has been evaluated and ascertained to be comparable to semiconductor-grade polycrystalline silicon. Solar cells fabricated from the material are also equivalent to those fabricated from semiconductor-grade polycrystalline silicon. (11 refs.)

77583 MOCVD growth and characterization of high luminescence efficiency AlGa_{1-x}As. D.Kasemset, C.S.Hong, N.B.Patel, P.D.Dapkus (Rockwell Internat., Thousand Oaks, CA, USA), K.Mohammed, J.L.Merz.

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England; IOP 1983), p.79-84.

Electrical and optical characteristics of AlGa_{1-x}As grown by atmospheric MOCVD without graphite baffles are described. It was found that the material properties of AlGaAs grown by this technique are sensitive to reactor conditions, especially after prolonged shutdown. Nevertheless, materials with good electrical and optical properties have been obtained using this technique. Comparison between the AlGa_{1-x}As visible lasers grown by LPE and MOCVD techniques indicates that the MOCVD technique can produce materials with essentially the same luminescence efficiencies as LPE. 77584 LPE growth of InP/InGaAs/InP DH wafers on (100) InP substrates. N.S.Takahashi, T.Sasaki, A.Fukushima, S.Kurita (Dept. of Electrical Engng., Keio Univ., Yokohama, Japan).

Electron. Lett. (GB), vol.19, no.11, p.402-3 (26 May 1983).

An InP/InGaAs/InP double heterostructure wafer is grown directly on a (100) InP substrate using very low temperature LPE growth. This crystal exhibits a thin transition layer at a InP-InGaAs interface because of dissolution of the ternary layer. (13 refs.)

77585 Direct liquid phase epitaxial growth of high-quality InP on (111)A oriented In_{0.53}Ga_{0.47}As. K.Nakajima, S.Yamazaki, K.Akita (Semiconductor Materials Lab., Fujitsu Lab. Ltd., Kawasaki, Japan).

J. Cryst. Growth (Netherlands), vol.61, no.3, p.535-45 (April-May 1983).

The liquid phase epitaxial (LPE) growth conditions for lattice-matched In_{0.53}Ga_{0.47}As on (111)A oriented InP, the growth rate of (111)A In_{1-x}Ga_xAs, and the surface morphology of InP and In_{1-x}Ga_xAs were investigated in detail. It was found that the distribution coefficients of Ga and As on the (111)A face are quite similar to those on the (100) face, but are different from those on the (111)B face. Suitable LPE growth conditions needed to obtain (111)A oriented high-quality InP/In_{0.53}Ga_{0.47}As/InP double heterostructures were determined. These conditions were found by investigating the effects of the cooling rate, the degree of supercooling and the growth temperature on the dissolution of In_{0.53}Ga_{0.47}As in InP solution. The surface of InP grown on (111)A In_{0.53}Ga_{0.47}As was found to be smooth enough for use in optical devices. The InP/In_{0.53}Ga_{0.47}As interfaces were found to be quite sharp by SIMS depth profiling measurements. (24 refs.)

77586 Growth of polysilicon sheets on a carbon shaper by the RAD process. C.Belouet, C.Texier-Hervo, M.Mautref (Lab. de Marcoussis, Centre de Recherches de la CGE, Marcoussis, France), C.Belin, J.Paulin, J.Schneider.

J. Cryst. Growth (Netherlands), vol.61, no.3, p.615-28 (April-May 1983).

The basic aspects of the RAD process, a sheet melt-growth process, and the characteristics of the continuous carbon shaper are described. It is shown that layers 5 cm in width and 100 μm in thickness can be grown at pulling rates of 10 cm/min with a crystallinity similar to that of self-supporting silicon ribbons. The present solar cells made from this material, using the carbon shaper as a back-contact, have an air-mass-one (AM1) conversion efficiency of nearly 10%. (26 refs.)

77587 The role played by the anions in cadmium electroplating from some acidic baths. A.M.Abd el-Halim, M.I.Sobahi, A.O.Baghlaf (Dept. of Chem., King Abdulaziz Univ., Jeddah, Saudi Arabia).

Surf. Technol. (Switzerland), vol.18, no.3, p.225-32 (March 1983).

The electrodeposition of cadmium from four selected baths with nearly the same composition except for the anion was examined. These baths were based mainly on acidic aqueous solutions of cadmium sulphate, cadmium chloride, cadmium bromide and cadmium iodide. It was found that the nature of the anion influenced to some extent the cathodic polarization and the throwing power of the cadmium electroplating from each bath; it also influenced the growth morphology and microhardness of the cadmium plates. (18 refs.)

77588 The effect of AC superimposed on DC in the electrodeposition of metals. M.D.Maksimovic, D.C.Totovski, A.P.Ivic (Univ. of Belgrade, Belgrade, Yugoslavia).

Surf. Technol. (Switzerland), vol.18, no.3, p.233-41 (March 1983).

The effect of the amplitude of AC superimposed on DC on the morphology of metal deposits is discussed, and the procedure for determination of the maximum amplitude of AC at which smooth deposits are obtained is given. A good agreement is obtained between the theory, experiments and literature data. (18 refs.)

- 77589 Gradient-free isothermal liquid-phase heteroepitaxy of $A^{III}B^V$ compounds.** Yu.B.Bolkhovityanov, V.I.Yudaev. *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.9, p.466-7 (Sept. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.17-18, p.1081-5 (Sept. 1982). [received: May 1983]
The authors describe controllable isothermal film growth in systems in which the difference between the lattice constants of the substrate and the source is such that continuous dissolution of the source can be arranged, with a corresponding continuous growth of the film on the substrate in the absence of a temperature gradient. As objects of study, they chose the heterosystems In-Ga-As, Ga-As-Sb, In-As-P, and Ga-As-P. (6 refs.)

81.20 OTHER METHODS OF PREPARATION OF MATERIALS

- 77590 Developments in research on the theory of metal forming.** Cheng Ru-xin, Xu Jian-ou, Deng Li-xin, Zhang Shu-gang (Chongqing Univ., China). *Acta Mech. Solida Sin. (China)*, no.1, p.137-45 (1982). In Chinese.
Presents the developments in research in recent years on the theory of metal forming with respect to basic laws, methods for solving problems in mechanics of forming, friction, the model experimental technique in the forming process, etc. (75 refs.)
- 77591 High-pressure growth of polycrystalline molybdenum disulphide.** S.K.Srivastava, B.N.Avasthi (Dept. of Chem., Indian Inst. of Technol., Kharagpur, India), B.Das, S.Basu. *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.178-80 (April 1983).
Polycrystalline molybdenum disulphide was prepared by high-pressure (56 kg/cm²) reduction of molybdenum trisulphide at 200°C. The stoichiometry was tested by chemical analysis and the crystallinity by X-ray diffraction studies. The room-temperature AC conductivity measurement showed a value of $1 \times 10^{-4} \Omega^{-1} \text{cm}^{-1}$. The material was diamagnetic with $\chi_L = 0.05 \times 10^{-6}$ emu. A band gap of 1.18 eV was obtained and n-type conductivity found. SEM studies showed 10-20 μm grain size. Temperature effect on the grain size was also studied. (11 refs.)
- 77592 Interaction between cast silicon properties and solar cell performance.** S.Hyland (Jet Propulsion Lab., Pasadena, CA, USA), P.Iles, D.Leung, G.Schwutke, J.A.A.Engelbrecht.
Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.68-73
Three types of cast silicon, Silso (Wacker), HEM (heat-exchanger method-crystal systems) and UCP (ubiquitous crystallization process-semix) were studied for their use as solar cells. Optical microscopy after etching revealed a high density of uniform dislocations (approaching $10^5/\text{cm}^2$), lines of dislocations indicating stress during crystal growth, and precipitates, some of which generate dislocations. Solar cells were fabricated by three processes. Results of solar cell processing revealed that these materials produce cells of lower efficiency than Czochralski control cells, and that the efficiencies of the three materials were quite close. Diffusion length and spectral response data are shown. Certain structural features are correlated with solar cell efficiency, diffusion length, and spectral response. Electron-beam induced current (EBIC) and light spot scanning are used to back up other measurements. (11 refs.)
- 77593 Silicon electrorefining using a semipermeable Cu₂Si:Si anode.** J.M.Olson, K.Carleton, A.Kibbler (Solar Energy Res. Inst., Golden, CO, USA).
Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.123-7
The authors have recently developed a silicon permeable anode material that significantly enhanced the effectiveness of the molten salt silicon electrorefining process and permits the low temperature fabrication of 'silicon' anode plates, a prerequisite for the operation of an efficient, multiplate electrorefining process. Using metallurgical grade silicon (Si) as feedstock, this hybrid process has yielded 99.996+% pure silicon in a stable, poly- or single-crystalline form and is particularly effective at removing boron, phosphorus, aluminum, and iron. This one-step electrorefining process is described. (7 refs.)

81.20E Powder techniques, compaction and sintering

- 77594 On the analytic description of the process of electric-discharge sintering of metal powders.** V.A.Belyi, V.V.Meshkov, N.K.Myshkin, A.I.Sviridenok (Inst. of Mech. of Metal-Polymer Systems, Acad. of Sci., Gomel, Belorussian SSR).
Sov. Phys.-Dokl. (USA), vol.27, no.8, p.642-4 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1121-4 (Aug. 1982). [received: May 1983]
Develops methods of calculating the main characteristics of pressure sintering of a powder system. The approach used is based on the decisive role of the generalized contact conductivity of the system in the process of its formation under the combined action of the thermal energy supplied to the contact of

powder particles and the mechanical stresses from the pressing force. (13 refs.)

- 77595 Crystal structure and electrical resistivity of MoS₂-NbS₂ alloys produced by self-propagating high-temperature synthesis.** V.L.Kalikhman, A.A.Golubnichaya, E.P.Gladchenko, V.K.Prokudina, L.P.Shechipinova (All-Union Sci.-Res. Inst. of Electromech., Acad. of Sci., Chernogolovka, USSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.10, p.801-3 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.56-9 (Oct. 1982). [received: May 1983]
Presents results of an investigation of sulfide alloys produced by self-propagating high temperature synthesis (SHS). Replacing Mo by Nb atoms in MoS₂ brings about a sharp fall in the latter's electrical resistivity because Nb is an acceptor impurity for MoS₂. The substitution of 5%Nb lowers ρ to $(1-2) \cdot 10^{-3} \Omega \cdot \text{cm}$, i.e., to the electrical resistivity level of graphite. The SHS method enables substituted Mo_{1-x}Nb_xS₂ compounds (solid solutions) to be obtained directly from a mixture of the elements (without the need to prepare Mo-Nb alloys), which results in higher productivity and lower power consumption. Admixture of a substituted compound as a means of lowering the reaction temperature makes it possible to obtain a product whose electrical resistivity is fairly evenly distributed over the ingot (cake) cross section and, in addition, is appreciably lower than that obtained with the admixture of MoS₂. The formation of solid solutions during SHS occurs mainly in those places where the charge melts, i.e. at distances from the reaction cake surface greater than 5-7 mm. (4 refs.)

The sintering of compacts from aluminum powders with zinc additions in the presence of a liquid phase is accompanied by their volume growth and a corresponding increase in their porosity. The volume growth of compacts from Al-Zn powder mixtures during liquid-phase sintering is mainly due to the Kirkendall effect, which manifests itself during the formation of a solid solution on the aluminum particles as a result of the diffusion of zinc atoms from the melt to the particles preceding their dissolution in the liquid phase. When the zinc content of a compact does not exceed its limit of solid-phase solubility in aluminum at the sintering temperature, the process of dissolution of aluminum in the melt may be ignored. The extent to which the volume of compacts from an Al-Zn powder mixture grows during sintering increases with increasing mean aluminum powder particle size. (6 refs.)
- 77597 New magnetic metallic glasses with reduced metalloïd content.** R.C.O'Handley, N.J.Grant (MIT, Cambridge, MA, USA).
Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.217-23
Several new magnetic amorphous alloys containing early transition metals and having reduced metalloïd content have been melt spun. Some properties of three examples of this new class, Co₅₀Nb₁₄B₆, Co₅₄Nb₁₀B₆, and Fe₈₁Nb₅B₁₄, are presented. The dominant late transition metal content assures an appreciable magnetic moment while the presence of an early transition metal significantly enhances the stability against crystallization. Crystallization temperatures are 742K, 698K, and 762K for the three alloys, respectively. X-ray diffraction patterns show the materials to be amorphous and to exhibit a large- r correlation length that is shorter than is typically observed in TL₉₀M₁₀ glasses containing more than one transition metal species. The coercivities of the glass compositions range from 30 to 70 mOe. (16 refs.)

77598 Perpendicularly crystallized ribbons by means of rapid solidifications from melts. N.Tsuya, K.I.Arai, K.Ohmori (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan). *Rapidly Solidified Amorphous and Crystalline Alloys*, Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.331-42.
Silicon-iron alloy ribbons containing around 6 wt.% silicon and Sendust alloy ribbons in the crystalline state were prepared by a rapidly quenching roll method. In the as-prepared ribbons, columnar grains were observed to grow from the surface to the middle part of the ribbon thickness. For the high silicon-iron ribbons annealed at 1200°C for 30 minutes, the grain size was more than 1 mm and the texture was highly oriented to (100)[0 k] cube-on-face. The coercive force was 55 mOe for the 6.6 Si-93.4 Fe ribbons annealed at 1180°C for 60 minutes in vacuum, and the average magnetic iron loss of the ribbons was measured. For Sendust ribbons, the lowest coercive force was 8 mOe when the ribbons were annealed at 1040°C for 30 minutes and then cooled at the rate of 60 deg/hour down to 550°C in vacuum. The recording heads made of laminated Sendust ribbons exhibit much better recording characteristics than ferrite heads, while frequency response remains flat. (21 refs.)

77599 Raney type nickel catalysts from RSR atomization of Al-Ni powders. C.S.Brooks, F.D.Lemkey, G.S.Golden (United Technol. Res. Center, East Hartford, CT, USA). *Rapidly Solidified Amorphous and Crystalline Alloys*, Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.397-407.
The synthesis and catalytic properties of hydrogenation catalysts of the Raney type derived from aluminum-nickel and aluminum-molybdenum-nickel rapid solidification rate (RSR) alloy powders have been evaluated. Activated Al-Ni alloy powder produced by RSR with 28.5 w/o nickel provides superior hydrogenation rates over bulk cast RaneyTM nickel catalyst for several selected, diverse organic functional groups. Rapid solidification, followed by heat treatment at 850°C in a fluidized bed of Al-Ni alloy powders with about 42 w/o nickel, appears to offer an alternate enrichment path for Al₃Ni and subsequently an enhanced catalytically active nickel. Rapid atomization synthesis of Al-Ni alloy powders by procedures such as RSR offers a promising new route for preparation of improved nickel hydrogenation catalysts of the skeletal Raney type. (10 refs.)

77600 Hot consolidation/devitrification metallic glasses—novel multiphase crystalline alloys in bulk shapes with technological potentials. R.Ray (Marko Materials Inc., N.Billerica, MA, USA). *Rapidly Solidified Amorphous and Crystalline Alloys*, Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.435-40.
Iron, nickel and/or cobalt base metallic glasses with low contents of metal-oids, predominantly boron, upon heat treatment at temperatures well above the crystallization temperature of the glassy phase, transform into ultra-fine-grained (microcrystalline) alloys containing finely dispersed boride phases. Microcrystalline alloys devitrified from glassy phase are characterized by high strength, excellent thermal stability and superior corrosion/oxidation resistance. Mechanical properties of bulk microcrystalline alloys hot consolidated-devitrified from selected low metalloid metallic glass alloys are reported. (6 refs.)

81.20J Dispersion-, fibre-, and platelet-reinforced metal-based composites

77601 Composite materials: some recent developments. K.K.Chawla (Post Graduate Div., Inst. Militar de Engenharia, Rio de Janeiro, Brazil). *J. Met. (USA)*, vol.35, no.3, p.82-7 (March 1983).

A state-of-the-art review of the current situation in composite materials is presented. The review is based on papers presented at the Fourth International Conference on Composite Materials, Tokyo, October 1982, and on the author's discussions with colleagues and composite manufacturers. Special emphasis is given to the Japanese work in this field. Among the so-called advanced fibers, carbon fiber today represents a fairly standard and acceptable engineering materials, and Japanese manufacturers dominate the fiber market worldwide. Kevlar fiber continues to make further inroads in aircraft and other industries while boron fiber continues to be a very expensive fiber. Among the ceramic fibers, continuous Al₂O₃ and SiC fibers appear to be very promising for metal matrix reinforcement. This is especially so now in view of the revolutionary processes (from organometallic compounds by heat treatment) for the manufacture of these continuous fibers developed in Japan. (11 refs.)

81.20L Ceramics and refractories

77602 Fabrication and characterization of TiC_{1-x}N_x (0 ≤ x ≤ 1) and Mo₂B_{2-x}C_x (x = 0, 1.0, 2.0) by high-pressure hot-pressing. M.Shimada, T.Suzuki, M.Koizumi (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).

Mater. Lett. (Netherlands), vol.1, no.5-6, p.175-7 (April 1983).
High-pressure reaction sinterings of TiN-TiC and MoC-MoB systems were carried out at 3.0 GPa and 1600°C for 30 min. The temperature dependences of Vickers microhardness and thermal conductivity were examined. (5 refs.)

77603 Synthesis of gadolinium-gallium garnet. O.V.Gorshkova, E.S.Lukin (D.I. Mendeleev Inst. of Chem. Technol., Moscow, USSR). *Glass & Ceram. (USA)*, vol.39, no.5-6, p.299-301 (May-June 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.6, p.23-4 (June 1982). [received: March 1983]

The purpose of the authors' investigation was to determine the possibility of producing a highly homogeneous powder of gadolinium-gallium garnet, active to sintering, by low-temperature synthesis from hydroxides prepared by the method of joint precipitation from concentrated chloride salt solutions. The effect of precipitation conditions (different combinations of the temperature of the precipitating agent and salt solution of the initial components) on such properties of the hydroxide powders as dispersion, filterability, and also on the microstructure and phase composition of synthesized gadolinium-gallium garnet powders was investigated. (2 refs.)

77604 Preparation and investigation of solid solutions with a perovskite structure. I.N.Belyaev, L.N.Aver'yanova, B.S.Medvedev, S.S.Lopatin (Rostov State Univ., Rostov-on-Don, USSR).

Inorg. Mater. (USA), vol.18, no.7, p.1007-10 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1194-8 (July 1982). [received: Feb. 1983]

It was proved that no PbAl_{1-x}Nb_xTi_{1-x/2}O₃ solid solutions are formed on direct reactions of the components PbTiO₃(PbZrO₃) and Pb₂AlNbO₆ up to a temperature of 1000°C. These solid solutions can be obtained only by gradual introduction of the component parts into them. Isomorphic substitution of titanium by aluminum and niobium in PbTiO₃ reduces the electrical conductivity and tan δ by 1-2 orders and makes it possible to obtain highly dense ceramics susceptible to polarization and suitable for use as piezoelectric materials. Favorable conditions for the appearance of the ferroelectric state develop on similar substitution of zirconium in PbZrO₃. (10 refs.)

77605 Some characteristics of the cold densification of wurtzite boron nitride powders under conditions of high pressures. S.S.Dzhamarov, N.P.Pavlenko, A.V.Bochko, P.A.Kornienko (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.755-9 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.6-10 (Oct. 1982). [received: May 1983]

Determinations were made, using mercury porosimetry methods, of the specific surfaces and mean particle sizes of the main fractions of wurtzite boron nitride powders and compacts. It was found that in pressing in the pressure range 1.0-10.0 GPa densification was accompanied by intense comminution of BN_w particles. The re-pressing of BN_w powders granulated after being pressed under a pressure of 4.3 GPa was satisfactorily described by Bal'shin's equation. (16 refs.)

77606 Sintering kinetics of tantalum carbide. P.S.Kislyi, S.A.Shvab, F.F.Egorov (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.765-7 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.16-19 (Oct. 1982). [received: May 1983]

A study was made of the influence exerted by one of the more effective methods of activating the sintering process, powder comminution, on the densification kinetics of TaC compacts. It was found that tantalum carbide sintered at a temperature above 2500°C. Decreasing the powder particle size activated the sintering process, but even with a powder of 0.17-μm particle size specimens sintered at 2700°C had a porosity of 11%. Coarse powders (>7-8 μm) sintered without densification, at 2000-2200°C by a surface self-diffusion mechanism. Fine powders (<7-8 μm) under densification at temperatures above 1400°C by a diffusion-viscous flow and a volume self-diffusion mechanism during long holding periods and also probably by an activated grain-boundary sliding mechanism in the initial stage of sintering after rapid heating. (9 refs.)

77607 Recrystallization of silicon nitride powders during hot pressing. I.I.Osipova, D.A.Pogorelova, V.N.Paderni, G.M.Kheidemane, T.A.Shapoval (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.789-92 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.43-7 (Oct. 1982). [received: May 1983]

To study the recrystallization processes accompanying the hot pressing of silicon nitride, several grades of silicon nitride powders were subjected to particle size and chemical composition determinations. The hot pressing of comminuted silicon nitride powders enables a uniform fine-grained structure of one and the same mean grain size to be obtained irrespective of the type of starting Si₃N₄ powder. At milling times of more than 100 h no significant decrease in particle size is observed. The recrystallization of milled silicon nitride powders during hot pressing takes place chiefly in the fine fractions appearing during milling. The degree of recrystallization attained is higher with ultrafine active silicon nitride powders (PCS) than with comminuted powders. (8 refs.)

77608 Effect of physicochemical transformations occurring in compacts during heating on the properties of manganese-zinc ferrites. A.V.Kopayev, V.P.Pashchenko, V.V.Ganin, T.S.Fedoseeva (Ivano-Frankovsk State Pedagogical Inst., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.806-9 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.62-6 (Oct. 1982). [received: May 1983]

A study was made of the physicochemical transformations occurring during the heating of specimens pressed from manganese-zinc ferrite powders. The effect of method of preparation of ferrite powders on the character of processes taking place in compacts during heating is demonstrated. The degree of decomposition of the spinel at a given rate of heating is lower in powders produced by the carbonate coprecipitation method than in powders obtained from an oxide mixture. The reason for this is that the structure of carbonate-grade powders has comparatively few defects. Lowering the rate of heating of specimens in the temperature range 550-650°C increases the degree of decomposition of the spinel, ensures a better reproducibility of properties, and improves the quality of ferrite parts. (11 refs.)

77609 Characterization of spray pyrolysed spinel powders. S.Kanzaki (Government Industrial Res. Inst., Nagoya, Japan), K.Hirao, N.Otsuka, K.Saito, Z.Nakagawa, K.Hamano.

Yogyo-Kyokai-Shi (Japan), vol.91, no.2, p.81-6 (1983). In Japanese.
Stoichiometric MgAl₂O₄ spinel powders have been synthesized from magnesium and aluminum nitrates solution by spray pyrolysis method. The obtained powders were characterized by means of X-ray diffraction, measurements of specific surface area, grain-size and pore-size distribution and scanning electron microscopy. The powders synthesized above 800°C consisted of spinel phase. The synthesized spinel powder consisted of agglomerated hollow spherical particles. The particle size in the agglomerates ranged from submicron to 20 μm in diameter. Further, each hollow spherical particle was formed by very fine primary particles (100 to 800 Å in diameter) among which much smaller pores (10 to 100 Å in diameter) were included. Diameter of the

agglomerates increased as the concentration of the solution and/or the water content in the solvent was increased. The specific surface area and the pore volume of the powders depended on the ratio of water/methanol content in the solvent, but they were not affected by solution concentration. (11 refs.)

77610 Control over the structure of hard metals and other heterophase materials produced by liquid-phase sintering. II. Principles of optimum design of hard metals. O.P.Kolchin (All-Union Sci.-Res. & Design Inst. of Refractory Metals & Hard Alloys, USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.768-71 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.19-23 (Oct. 1982). [received: May 1983]

For pt.1 see Poroshk. Metall., no.9, p.14-8 (1982). Considers some hitherto little investigated problems common to materials produced by LPS. Suggestions are made, the implantation of which necessitate a critical assessment of methods of manufacture of hard metals and alloys. (3 refs.)

77611 Structural investigations of detonation-deposited tungsten carbide-cobalt coatings. R.A.Alfintseva, V.Kh.Kadyrov, V.K.Fedorenko, A.Z.Sharypov (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.772-6 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.24-9 (Oct. 1982). [received: May 1983]

A study was made of the character of structure formation in the detonation deposition of VK20 hard-metal mixtures and of the mechanism of disintegration of the coating material under the action of vibratory contact loading and fretting corrosion. The phase composition of detonation-deposited VK type coatings was found to differ from that of the starting mixtures. A deposited layer contains about 40-50% of the tungsten carbide WC present in the starting mixture, metallic tungsten and cobalt, the intermetallic compounds Co_3W_6 and Co_3W , traces of W_2C , and a small amount of complex carbides. The amount and particle size of the tungsten carbide in a coating are determined by the particle size distribution of the powder being deposited and detonation process parameters. The investigations have shown that the optimum powder particle size range for the process of detonation deposition of hard-metal mixtures may be taken to be 5-40 μm . During detonation deposition under the conditions investigated the usual hard-metal structure and composition are not obtained. Most of the starting tungsten carbide decomposes with the formation of tungsten and cobalt intermetallic compounds. (13 refs.)

77612 Formation of a nickel-clad titanium carbide coating and effect of spraying conditions on its structure and properties. F.I.Kitaev, A.S.Namychkin, A.G.Bakanov, L.M.Ryabich, I.I.Timofeeva, N.P.Tel'nikova (Kuibyshev Aviation Inst., Kuibyshev, USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.776-80 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.29-33 (Oct. 1982). [received: May 1983]

Use of nickel-clad titanium carbide in plasma spraying leads to the formation of a wear-resistant coating composed of TiC grains which are fairly evenly distributed in a matrix containing reaction products of the starting components. To study the behavior of particles in the plasma jet and the character of coating formation, experiments were carried out in which composite materials (CMs) with nickel contents of 25, 35, and 50 wt.% (KTP-25N, KTP-35N, and KTP-50N) were sprayed into water and onto glass. The investigation showed that the metallic shells on the CM particles were generally preserved during the latter's flight to the substrate. In CMs spray-deposited onto glass no sizable regions were found of metal without carbide cores. In microsections of particles sprayed into water there were no sharp boundaries between the cladding layers and carbide grains. The microhardness of the outer layers varied in the range (2-8) $\cdot 10^3$ MPa. (1 ref.)

81.20P Glasses

77613 Variation of lighting engineering characteristics of selenium-cadmium glass during hardening. E.B.Sevryuk, A.I.Neich, V.A.Khvostova. *Glass & Ceram. (USA)*, vol.39, no.5-6, p.231-4 (May-June 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.5, p.12-14 (May 1982). [received: March 1983]

Articles of this glass are subjected to liquid hardening to increase the heat resistance in the range of 250-400°C. It is known that hardening of red selenium-cadmium glass results in a shift of the spectral transmission curve. Investigations of the effect of different production factors on the nature and extent of variation of the lighting engineering characteristics (color tone λ , saturation P, and integral light transmission τ) during hardening of glass colored with cadmium sulfoselenide are presented. Heat-resistant glass of the $\text{SiO}_2\text{-Al}_2\text{O}_3\text{-B}_2\text{O}_3\text{-ZnO-Na}_2\text{O}$ system was investigated. Se, CdS, and CdCO_3 were introduced as the coloring materials. (4 refs.)

77614 Melt processing and properties of barium-Sialon glasses. W.K.Tredway, S.H.Risbud (Dept. of Ceramic Engng., Univ. of Illinois, Urbana, IL, USA).

J. Am. Ceram. Soc. (USA), vol.66, no.5, p.324-7 (May 1983). Bulk oxynitride glasses in the system Ba-Sialon were prepared by cooling homogenized melts from $\approx 1740^\circ\text{C}$ at $\approx 50^\circ\text{C}/\text{min}$. The microchemistry, microstructure, and properties of these materials were studied by DTA, dilatometry, electron microscopy, and energy dispersive X-ray analysis. Up to ≈ 7 at.% nitrogen was retained in the glasses by the conventional glass-processing techniques used. Microscopically homogeneous glasses were obtained despite macroscopic segregation of millimeter-sized metallic spheres consisting of Si and Fe. Incorporation of nitrogen in the glass network led to decreasing thermal expansion coefficients, higher glass-transition temperatures, and greater values of indentation hardness with increasing nitrogen content. (19 refs.)

77615 The fining of glass. A Raman-spectrometric investigation into the action of arsenic oxides. H.Verweij (Philips Res. Labs., Eindhoven, Netherlands).

Philips Tech. Rev. (Netherlands), vol.40, no.10, p.310-15 (1982).

A study has been made of the fining action of arsenic oxides in glass formation. Specimens composed of 30 mol.% K_2CO_3 , 70 mol.% SiO_2 , and 1 mol.% As_2O_3 were exposed for an hour to temperatures of 700, 800, 850, 900, 1000 or 1100°C . After cooling the specimens rapidly to room temperature, spectra were recorded with a laser-Raman spectrometer. Above 900°C there is reduction from pentavalent to trivalent arsenic, accompanied by the release of oxygen. This oxygen has a fining action, either by causing the CO_2 bubbles produced earlier in the melt to expand, or by displacing the CO_2 . Any oxygen bubbles still remaining dissolve again in the melt on cooling. The Raman spectra also suggest that the reduction of As^{5+} to As^{3+} is chemically induced, by a reduction of the potassium content in the liquid glass phase during the glass-forming process. (3 refs.)

77616 Thermodynamic properties of liquid silver-thallium alloys. K.Kameda, Y.Yoshida, S.Sakairi (Dept. of Metall., Iwate Univ., Morioka, Japan).

J. Jpn. Inst. Met. (Japan), vol.47, no.5, p.406-12 (1983). In Japanese.

The EMF of a galvanic cell involving fused salt electrolytes has been measured, in order to obtain thermodynamic data of the liquid Ag-Tl system for $N_{\text{Tl}}=0.231\text{-}0.850$ in the temperature range from 938 to 1131°C . The concentration dependence of activities of both thallium and silver shows a positive moderate deviation from the Raoult's law. The order of magnitude of both activities and heats of mixing of IB metals (Cu, Ag and Au)-thallium binary alloys in the intermediate composition range is the same as that in the Periodic Table (i.e. Cu, Ag and Au). The activities and the heats of mixing of the liquid Cu-Tl and Ag-Tl alloys are respectively quite different from those of the liquid Au-Tl system, in which the activities show negative moderate deviations and the heats of mixing are slightly exothermic in the whole concentration range, owing to the larger electronegativity factor in the gold alloys. Furthermore, results of both activities and heats of mixing measurements in the liquid binary alloys composed of IB metals and thallium, lead, bismuth and those composed of IB metals and other normal metals (i.e. Zn, Cd, Al, Ga, In, Sn and Sb) have been compared and discussed in connection with the electronic structure of the elements and with the alloy theory by Engel concerning the phase stability of solid solution between IB metals and normal metals. (38 refs.)

77617 Determination of thermodynamic activities of components in the sections $x_{\text{Cr}}=0.11$ and $x_{\text{Cr}}=0.33$ of γ -solid solution Cr-Fe-Ni at 1500K. J.Vrestal (CSAV, Brno, Czechoslovakia), A.Rek.

Kovove Mater. (Czechoslovakia), vol.21, no.2, p.97-104 (1983). In Czech.

Thermodynamic activities of components in the γ -solid solution Cr-Fe-Ni were measured by the effusion method together with the analysis of the ratio of components in the condensed layer by an electron probe microanalyser. The sections $x_{\text{Cr}}=0.11$ and $x_{\text{Cr}}=0.33$ were studied at 1500K. The pure FCC-metals (Fe,Ni) and BCC-chromium were chosen as standard states. The measured values were optimised by a procedure securing the consistency with previous results. The Gibbs-Duhem equation and the thermodynamic condition of solution stability are satisfied for the concentration dependence of the activity of components at 1500K. The interaction coefficients characterizing the influence of the third component concentration on the activity of binary system components for $x_{\text{Fe}} \rightarrow 0$ and $x_{\text{Ni}} \rightarrow 0$ are calculated for both sections. (13 refs.)

77618 Bi-In system. D.S.Evans, A.Prince (General Electric Co. plc, Hirst Res. Centre, Wembley, England).

Met. Sci. (GB), vol.17, no.3, p.117-21 (March 1983).

The Bi-In system has been redetermined mainly using thermal analysis but supplemented as appropriate by metallographic and X-ray examination. It is confirmed that the system contains four compounds BiIn , Bi_2In_3 , BiIn_2 and an ϵ phase at approximately 90 at.%In. Bi and BiIn form a eutectic at 46.8 at.%In and 109.7°C . The compound Bi_2In_3 is generated in a peritectic reaction at 88.9°C and forms a eutectic with BiIn₂ at approximately 64.6 at.%In and 88.7°C . The ϵ phase is also generated in a peritectic reaction, at a temperature of 93.5°C , and forms a eutectic with BiIn₂ at 78.5 at.%In and 72.7°C . The probable accuracy of the results is ± 0.5 at.%In and $\pm 0.5\text{K}$. The ϵ phase decomposes eutectoidally at $49 \pm 1^\circ\text{C}$. Equations representing the main liquidus boundaries and the α -In solidus boundary are given. (12 refs.)

77619 Decomposition of sigma phase in a Ni-Cr-W system. M.Kikuchi, M.Kajihara, Y.Kadoya, R.Tanaka (Dept. of Metall. Engng., Tokyo Inst. of Technol., Tokyo, Japan).

Ser. Metall. (USA), vol.17, no.4, p.475-8 (April 1983).

Presents a preliminary observation of the decomposition of σ phase at the temperatures lower than 1000°C . The distribution of phases in the aged specimens was examined by optical as well as back scattered electron metallography. Phase identification was carried out by means of powder X-ray diffraction method. It was shown that no σ phase exists as an equilibrium phase in the Ni-Cr-W system below 950°C . The alloys without σ phase above 950°C are not prone to σ phase formation below 950°C . (23 refs.)

- 77620 Multicomponent glasses of GeO_2 and Sb_2O_3 with Bi_2O_3 , Ti_2O_3 , and/or PbO . K.Nassau, D.L.Chadwick (Bell Labs., Murray Hill, NJ, USA). *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.332-7 (May 1983). Previous studies on glass formation involving GeO_2 with Bi_2O_3 , Ti_2O_3 , and PbO were extended by the use of Sb_2O_3 . Wide areas of glass formation occur in the systems GeO_2 - PbO - Sb_2O_3 and GeO_2 - Bi_2O_3 - Sb_2O_3 at all but the lowest GeO_2 contents; the region of single-phase glasses in the system GeO_2 - Ti_2O_3 - Sb_2O_3 is severely restricted. Glasses were examined by powder X-ray diffraction, differential thermal analysis, thermomechanical analysis, and Archimedes' technique to obtain glass transition and crystallization exotherm temperatures, thermal expansion coefficients, and densities; these properties are presented in diagrams for the GeO_2 - Sb_2O_3 binary and for two ternary systems. Based on calculated values of λ_0 , the wavelength for zero material dispersion, and $dM/d\lambda$, the material dispersion slope at λ_0 , compositions in these systems may be useful for the construction of ultralow-loss optical waveguides in the 3 to 4 μm region. - 77621 Oscillatory crystallization of a stratifying alloy. M.B.Geilikman, D.E.Temkin (Inst. of Experimental Mineralogy, Acad. of Sci., Moscow, USSR). *JETP Lett. (USA)*, vol.36, no.7, p.292-5 (5 Oct. 1982). Translation of: *Pis'ma v Zh. Eksp. i Teor. Fiz. (USSR)*, vol.36, no.7, p.238-41 (5 Oct. 1982). [received: May 1983]
- It is shown that in a certain range of parameters, an oscillatory process leading to the formation of a layered structure arises. The position of the kinetic transition line from this regime to the stationary regime, which leads to the formation of a solid phase with homogeneous composition, is indicated. (4 refs.)
- 77622 Direct observation of the coarsening of solidification structure in Sn-Pb alloy. K.Kusabiraki (Dept. of Metall. Engng., Toyama Univ., Takakoka, Japan), K.Imai. *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.450-6 (1983). In Japanese.
- In order to elucidate the coarsening process of the dendrite structure during isothermal holding in the liquid-solid region, in situ observation was carried out. It was found that it is possible to estimate a dendrite structure in a bulk from that on a surface, because both the dendrite arm spacings are almost similar. It was confirmed by the direct observation that the coarsening occurred due to the disappearance of smaller arms and the melting off of arms in a necked region. In the case of a small cylindrical arm, the coarsening of dendrite structure is explained by Model I proposed by Kattamis et al. In the case of melting off of dendrite arm in the necked region, the coarsening of dendrite structure is not explained by Model II proposed by Kattamis et al. A new model based on the kinetics of sintering of powder was proposed for this case. (14 refs.)
- 77623 Simplified determination of cooling conditions of aluminium-silicon alloys. H.E.Exner, J.Paul (Max-Planck-Inst. fur Metallforschung, Inst. fur Werkstoffwissenschaften, Stuttgart, Germany). *Met. Sci. (GB)*, vol.17, no.3, p.141-3 (March 1983).
- A method is described for estimating the velocities of the solidification front from the cooling rates immediately after solidification which can easily be determined from cooling curves by means of thermocouples. The equations have been tested by means of experiments carried out with a eutectic aluminium-silicon alloy and satisfactory agreement has been obtained. Possible practical applications are nondestructive determination of local microstructural parameters and, in turn, local properties, or local cooling conditions from simple counting measurements from metallographic samples. (13 refs.)
- 77624 Ferrite morphology in rapidly solidified ferritic Fe-Cr-C steels. P.A.Molian (Dept. of Mech. Engng., Iowa State Univ., Ames, IA, USA), W.E.Wood. *Scri. Metall. (USA)*, vol.17, no.4, p.431-4 (April 1983).
- Laser surface alloying of chromium into electrolytically pure iron and carbon steels was carried out to produce high chromium ferritic steels. The morphology of the ferrite was then investigated as a function of carbon and chromium contents of the alloys. It is proposed that during laser processing, the ferritic Fe-Cr and Fe-Cr-C alloys do not experience sufficient undercooling ahead of the solid-liquid interface to cause nucleation and therefore the growth mechanism is essentially epitaxial. When the carbon content is increased from 0.2 to 0.5% greater constitutional undercooling is developed, promoting a transition from grain to cell morphology. (1 ref.)
- 77625 Structure of Fe-40 at.%Al obtained by rapid quenching from melt. N.Junqua, J.Grilhe (Lab. de Metall. Phys., Faculte des Sci., Poitiers, France). *Scri. Metall. (USA)*, vol.17, no.4, p.441-4 (April 1983). In French.
- Using ultrafast quenching from the melt, the authors observed the existence of antiphase domains and a new phase not seen on the equilibrium diagram. This L10 phase is found to have a grain structure consisting of 'needles' and 'platelets'. Electron microscopic evidence is presented which supports these findings. (3 refs.) U.M.G.
- 77626 Behavior of rod macrocoolers in the reinforcement of ingots and castings. A.B.I.Medovar, V.Ya.Saenko, V.I.Us, L.B.Medovar (E.O. Paton Inst. of Electric Welding, Acad. of Sci., Ukrainian SSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.7, p.581 (July 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.1-3, p.330-1 (July 1982). [received: April 1983]
- When the material used for sectional macrocoolers is a metal with a melting point below the solidification point of the melt, shrinkage cavities typical of an ordinary casting are formed in them during crystallization. If the melting point of the rod is higher than the solidification point of the melt, i.e. if relatively refractory metal rods are used, they remain unmelted in the ingot (casting). But if the melting point of the rod is below the solidification temperature of the melt, the rod—having been immersed in liquid metal—first causes crystals to grow in the adjoining volume of this melt and becomes thicker, as it were, and then, as in the case of a sphere, melts partially or completely. The rate of melting and solidification of the reinforcing rod is determined by the relative speed of the melt and the rod (when the rod is immersed in the melt, or when the melt is raised into the space in which the rod has been set up). - Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.349-54
- The microstructures and local composition variations in centrifugally atomized high-sulfur stainless steel powder are investigated. Both FCC and BCC are found to be primary solidification phases in the as-solidified powder, where the smaller powder particles tend to be BCC. Cellular solidification structures, with sulfide precipitates at the cell walls, are observed in both FCC and BCC particles. A noncellular BCC structure is also observed with small sulfide precipitates throughout the entire structure. Analysis of the nucleation process for solidification indicates that a transition from FCC nucleation to BCC nucleation occurs with increasing wetting angle in heterogeneous nucleation. Thus BCC should nucleate in the smaller droplets of a liquid dispersion where catalytic surfaces of low potency tend to be the only heterogeneous nucleants available. (5 refs.)

81.30H Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder
(see also 64.70K Solid-solid transitions)

77631 Diffusionless omega transformations in quenched and pressurized Zr-Mo alloys. O.Botstein (Dept. of Materials Sci. & Engng., Technion Israel Inst. of Technol., Haifa, Israel), M.Talianker, A.Rabinkin. *Acta Metall. (USA)*, vol.31, no.6, p.947-53 (June 1983). Metastable structures formed in Zr-Mo alloys on quenching and following high pressure application were studied by transmission electron microscopy and X-ray phase analysis. New structures consisting of a mixture of α -phase and ω phase originating in α [i.e. $\omega(\alpha)$] were observed. Complex structures form in quenched Zr alloys with 1.5-2.5 at.% Mo which contain α , β and ω originating in both α and β . The maximum possible number of the ω particle orientations (ω -variants) in a sample is seven: three for $\omega(\alpha)$ and four for $\omega(\beta)$. High pressure application to the quenched structures gives rise to the α - $\omega(\alpha)$ and β - $\omega(\beta)$ transformation. Pressure induced ω phase can be retained at atmosphere pressure upon unloading. The genesis of various metastable structures is proposed by consideration of metastable phase equilibria existing in the Zr-Mo system. (20 refs.)

77632 Order-disorder transformation study in 25-35 at.% Cd-Mg alloys by energy dispersive X-ray diffraction (EDXD). E.S.U.Laine, I.T.Lahteenmaki (Dept. of Phys. Sci., Univ. of Turku, Turku, Finland). *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.166-70 (April 1983). It is shown that the energy dispersive X-ray diffraction (EDXD) method is in some cases a very applicable tool to study the order-disorder transformation. (12 refs.)

77633 Influence of the crystallography of the grain boundary/grain system on the α - γ phase shift in Fe-4%Ni alloys. N.Benfetima, C.Haut, S.Lartigue, D.Bouchet, L.Priester (Lab. de Metall. Phys., Univ. Paris-Sud, Orsay, France). *Mem. & Etud. Sci. Rev. Metall. (France)*, vol.80, no.3, p.149-55 (March 1983). In French. Work was carried out on an Fe-4%Ni alloy containing 150.10⁻⁶ wt.% carbon. The preparation of transparent cuts by the double-jet technique. Results are presented and interpreted. (18 refs.)

77634 TTT curves for the formation of austenite. U.R.Lenel (Fulmer Res. Inst., Slough, England). *Ser. Metall. (USA)*, vol.17, no.4, p.471-4 (April 1983). Describes the main features of time-temperature-transformation (TTT) diagrams which have been determined for re-austenitisation of two contrasting low carbon steels, one containing 10% Cr, the other 1% Mn. (5 refs.)

77635 Phase transformation studies of laser-processed Fe-0.2%C-Cr surface alloys. P.A.Molian, P.J.Wang (Materials Sci. Dept., Oregon Graduate Center, Beaverton, OR, USA), K.H.Khan, W.E.Wood. Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.511-15. Phase transformations in laser-processed Fe-0.2%C-Cr surface alloys with 5%, 10%, 20%, and 30% Cr were studied by light and electron microscopy. Alloys containing 5% and 10% Cr were found to be fully martensitic with a dislocated lath type substructure. Thin films of retained austenite and a homogeneous dispersion of fine carbides were observed at the lath boundaries and prior austenite grain boundaries. The alloy with a 20%Cr content showed a unique microstructure of twinned austenite needles in a dislocated ferrite matrix while the alloy containing 30% Cr exhibited a dislocated ferrite structure with M₂₃C₆ carbides. 81.30K Martensitic transformations
(see also 64.70K Solid-solid transitions)

77636 On the change in the austenite lattice parameter due to the martensitic transformation in an Fe-32Ni alloy. M.Hayakawa, M.Oka (Dept. of Mech. Engng., Tottori Univ., Tottori, Japan). *Acta Metall. (USA)*, vol.31, no.6, p.955-9 (June 1983). For the purpose of clarifying the mechanism of the often reported reduction in the austenite lattice parameter due to the martensitic transformation, the lattice parameters of an Fe-32Ni alloy prepared by different cooling rates from the austenitization temperature have been measured in the states before and after the martensitic transformation. From the measurement made, the stress levels have also been calculated for both states. In the slowly cooled stress-free specimen no significant change in the lattice parameter was found after the martensitic transformation, which is in agreement with the theoretical prediction, whereas in the quenched specimens, in which quenching stress is present, an appreciable reduction in the parameter was found. The latter is accounted for by stress relaxation due to the martensitic transformation. (16 refs.)

77637 Influence of a high pressure on the kinetics of formation of lath (packet) martensite. V.I.Izotov, A.V.Omel'chenko, L.S.Pankratova, V.I.Soshnikov (Inst. of Metall. & Phys. of Metals, Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.711-16 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A magnetometric method was used to study the kinetics of a martensitic transformation occurring at pressures up to 8000 atm in an alloy of the Fe-8.5 Cr-1 Ni composition, in which lath (packet) martensite was formed. The transformation was isothermal. A complex pressure dependence was observed for the temperatures of initiation and termination of the martensitic transformation. An estimate was obtained of the kinetic parameters of the isothermal martensitic transformation, which agreed with the parameters of the plastic deformation process. It was concluded that the nucleation of martensite was associated with thermally activated motion of dislocations. (20 refs.) A.T.

77638 Martensitic transformations in low-carbon nickel-molybdenum steels. V.M.Schastlivtsev, I.L.Barmina, I.L.Yakovleva, S.E.Karzunov, D.A.Mirzaev, O.P.Morozov, Yu.L.Legostae, T.G.Semicheva (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.724-32 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. Magnetometric, electron-microscopic, and durometric methods were used to study the kinetics of transformation of austenite in low-carbon 10N5MF and 12KhN4MF steels during cooling at various rates (from 10 to 3×10⁵°C/sec). It was found that, depending on the rate of cooling, one could expect bainitic and martensitic transformations of two types (isothermal and athermal) with the martensitic points 340-310 and 215°C, respectively. A reduction in the cooling rate resulted in a continuous change from the isothermal martensitic transformation to the bainitic. The structure and microhardness of the products of the martensitic transformations were determined. (13 refs.) A.T.

77639 Influence of the composition of the particles contained in austenite on the characteristics of the γ - α transformation. L.P.Gun'ko, V.M.Ermakov, Yu.N.Koval', L.E.Kozlova, V.V.Kokorin (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.739-43 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. An analysis was made of the influence of composition of coherent particles formed in austenite on the characteristics of the γ - α transformation. The example of Fe-Ni-Cu alloys (with the precipitates in the form of solid solutions based on Cu) and Fe-Ni-Co-Ti alloys (with the precipitates in the form of particles of the γ' phase) showed that those particles which had high values of the Young modulus tended to exhibit features typical of thermoelastic martensitic transformations. (10 refs.) A.T.

77640 Thermodynamics of the martensitic transformation in high-nickel iron alloys. Thermal effect. D.A.Mirzaev (Lenin Komsomol Polytech. Inst., Chelyabinsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.774-80 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. It was found that allowance for the ferromagnetism of the γ phase of Fe-Ni alloys made it possible to reduce strongly the discrepancy between the theoretical and experimental values of the heat of martensitic transformation Q when calculations were made of the difference between the enthalpies of the α - and γ -phases. The composition dependence of Q was accounted for and an estimate was made of the energy stored in α -martensite. (21 refs.) A.T.

77641 Structure mechanics connected with the martensitic transformation of steels. Consequences for industry. L.Hyspecka (Acad. des Sci., Usine Vitkovice, Ostrava, Czechoslovakia). *Mem. & Etud. Sci. Rev. Metall. (France)*, vol.80, no.3, p.157-69 (March 1983). In French. A study is presented of the morphology problems of martensite with regard to mechanical properties. Effects of the structure condition on the mechanical properties are investigated for high-alloy steels type 13%Cr-6%Ni (Mo) and 9%Ni (Mo), and for low-alloy steels with 0.3%C (Mn, Si, Mo) and with 0.4%C (Mn, Si, Cr, Ni, Mg). (37 refs.)

77642 Bulk modulus and martensitic transformation in Mn-Cu alloys. Y.Tsunoda, N.Oishi, N.Kunitomi (Faculty of Sci., Osaka Univ., Osaka, Japan). *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.51-5 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982). The concentration dependence of elastic moduli has been measured over a wide concentration range of Mn-Cu alloys by means of neutron inelastic scattering and ultrasonic measurements. The elastic constant C₁₁ markedly decreases with the increase of Mn content and attains its minimum value near the composition Mn₅₂Cu₄₈ at which the martensitic transformation takes place at room temperature. However, a direct trigger of the phase transition is attributed to the vanishing of the shear modulus, contrary to the authors' previous results of neutron inelastic scattering. An anomalous volume effect is discussed in connection with the small bulk modulus near the martensitic transformation in γ -MnCu alloys. The possibilities of d-electron Coulomb correlation and the formation of the local magnetic moment are discussed as origins of the martensitic transformation in Mn-rich Mn-Cu alloys. (7 refs.)

77643 Landau theory for a cubic to tetragonal structural phase transformation. T.C.Choy, W.Young (Queen Mary Coll., Univ. of London, London, England), R.D.Lowe. *Physica B & C (Netherlands)*, vol.119 B+C, no.1-2, p.56 (April 1983). (Proceedings of the International Symposium on Magnetoelasticity in Transition Metals and Alloys, Nagoya, Japan, 15-16 Sept. 1982). Summary form only given, as follows. The authors present a new phenomenological description of a cubic to tetragonal martensitic phase transformation. The essential feature of the martensitic transition in which the transition takes a substantial temperature interval to complete is incorporated by starting from a free energy that contains the fractional volume of converted material as an additional order parameter. This model is remarkable in having a co-existing first- and second-order phase transition at the same critical temperature T_M. The c-axis order parameter has a jump, while the a-axis and fractional conversion x remain continuous at T_M. The authors have found it necessary to impose a generalised constraint condition related to the internal pressure on the system. They discuss the origin of this constraint and relate it to the magnetoelastic coupling which drives the phase transformation. Application of this theory to experiments on the alloy Mn₈₅Ni₁₅C₆ in its antiferromagnetic state (T_M<T_N) is discussed. (no refs.)

77644 Precipitation studies in lead-tin alloys. P.A.Varkey, A.R.K.L.Padmini (Appl. Phys. Dept., M.S. Univ. of Baroda, Baroda, India). *Acustica (Germany)*, vol.52, no.5, p.290-5 (April 1983). Investigation of cellular precipitation process in Pb rich, Pb-Sn alloys containing 6.1 and 12.1 wt percentage of Sn has been carried out using the composite oscillator technique. From the measured longitudinal and shear ultrasonic velocities a set of elastic moduli and related parameters are estimated. The internal friction is also measured. The elastic parameters and the internal friction are found to exhibit interesting variations during the precipitation

process. The results are interpreted on the basis of the theory of kinetics of cellular precipitation proposed by Turnbull. (19 refs.)

77645 The formation of discrete precipitate dispersions on mobile interphase boundaries in iron-base alloys. R.A.Ricks, P.R.Howell (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *Acta Metall. (USA)*, vol.31, no.6, p.853-61 (June 1983). Concerns the formation of particulate carbide precipitates on high-energy interphase boundaries in alloy steels. Specifically it is shown that such boundaries may act as nucleation sites for the precipitation of alloy carbides, despite their high mobility, and that the precipitation may influence the growth mechanisms of the boundary. In addition the crystallography of the reaction is discussed with respect to the adoption of a unique orientation relationship between the ferrite and carbide phases of two distinctly different types of alloy carbides. (31 refs.)

77646 A TEM investigation of the structure of nitrogen-implanted Ti-6Al-4V. R.Hutchings (Brown Boveri Res. Center, Baden, Switzerland). *Mater. Lett. (Netherlands)*, vol.1, no.5-6, p.137-40 (April 1983). The microstructure of nitrogen-implanted Ti-6Al-4V has been investigated by transmission electron microscopy. Implantation conditions were typical of those used in metallurgical applications. The major effects of implantation are a considerable decrease in grain size and copious precipitation of TiN with a recognizable orientation relationship to the hexagonal matrix. (8 refs.)

77647 Electrical conductivity and infrared absorption spectrometry study of hematite precipitation from defective ferrites. B.Gillot, R.M.Benloucif, F.Jemali (Lab. de Recherches sur la Reactivite des Solides, Faculte des Sci. Mirande, Dijon, France). *Mater. Chem. & Phys. (Switzerland)*, vol.8, no.4, p.349-63 (April 1983). In French.

The hematite precipitation from zinc or cobalt-substituted defective spinels of type $(M_{1-x}^{2+}Fe^{3+})_{(8-2x)/3}[O_{(1-x)/2}]O_4$ has been investigated using electrical conductivity and infrared spectrometry. The experimental data show that the temperature and kinetics of hematite precipitation depend of substitution extent x and might be closely associated with the cation vacancy in the spinel lattice. Stabilization of spinel solid solution by the cation is more pronounced for zinc than for cobalt and the effect of the cation is interpreted in terms of cation distribution in the spinel lattice. (27 refs.)

77648 On the precipitation of Laves phase in 12 Cr-Mo-V-W steel heated for a long time. M.Nakahashi, S.Komatsu, S.Nakamura (Res. & Dev. Center, Toshiba Corp., Kawasaki, Japan), M.Yamada. *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.426-31 (1983). In Japanese. Studies on 12 Cr-Mo-V-W steel for steam turbine blade show that the Fe_3Mo intermetallic compound, so called Laves phase, is precipitated at grain boundaries after long time heating. The composition of the Laves phase in this steel having internal lattice defects is expressed by the formula $(Fe_{23}Cr_7)(Mo_{20}W_{12})$ and is unchanged after long time heating. The $M_{23}C_6$ -Laves phase transformation appeared to occur in situ, and the growth rate for the Laves phase during heating was larger than that for $M_{23}C_6$. The Laves phase area fraction was directly proportional to the Larson-Miller parameter ($P=T(C+\log t) \times 0.001$) in the 23-23.5 range. (10 refs.)

77649 The investigation of dissolution and precipitation kinetics of secondary phases in a Cr15Ni70W10MoAlTiB alloy. K.Hrbacek (Prvni Brnenska Strojirna k.p., Brno, Czechoslovakia), J.Kudrman, J.Hakl, R.Pech. *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.115-130 (1983). In Czech. The dissolution kinetics of γ' phase and carbides during heating as well as their precipitation kinetics was studied. The results show the γ' phase dissolution above 900°C and the instability of carbides occurring at grain boundaries above 1050°C. The MC precipitates are also stable in this temperature region. The strengthening kinetics was investigated at six different temperatures between 780-910°C. The measured values seem to be in a good agreement with theoretical models. (23 refs.)

77650 VC coarsening in 0.5Cr-0.5Mo-0.25V steel. J.M.Silcock (CEGB, Central Electricity Res Labs., Leatherhead, England). *Met. Sci. (GB)*, vol.17, no.3, p.101-6 (March 1983). Observations of VC particles in 0.5Cr-0.5Mo-0.25V steels show that the coarsening rate is generally very low. Insufficient data are available to determine the time dependence exactly so that coefficients have been calculated using a cube relationship to enable comparison with some relevant published data. The wide range of particle sizes in as-heat treated materials is emphasized. Interphase particles appear to coarsen less readily than dislocation nucleated particles. (6 refs.)

77651 Carbide transformations in microstructurally unstable low alloy ferritic steel. R.B.Carruthers, M.J.Collins (Sci. Services Dept., CEGB, Harrogate, England). *Met. Sci. (GB)*, vol.17, no.3, p.107-10 (March 1983). The changes in carbide size and chemical composition accompanying prolonged exposure at elevated temperature have been studied on a number of casts of a low alloy ferritic steel. It is shown that the reactions occurring are more complex than originally believed and that particle size measurements cannot yet be used as an aid to estimating the remanent creep life of plant components. (8 refs.)

77652 On the formation of Fe-carbides in Cu-Fe and Cu-Au-Fe alloys. O.Schneeweiss, U.Gonser, H.-G.Wagner (Fachbereich Werkstoffwissenschaften, Univ. des Saarlandes, Saarbrücken, Germany). *Scr. Metall. (USA)*, vol.17, no.4, p.463-6 (April 1983). The authors have observed that carburisation of the alloys only takes place after remelting in a graphite crucible in a H_2 atmosphere. The precipitation of Fe-C particles and subsequent changes in morphology were in agreement with the phase diagram. (5 refs.)

77653 Deceleration of relaxation in a Cu-Si alloy. A.Coujou, P.Coulomb (Microscopie et Structure des Materiaux, Univ. Paul Sabatier, Toulouse, France). *Scr. Metall. (USA)*, vol.17, no.4, p.485-90 (April 1983). The authors take advantage of the specific shape of relaxation curves in a Cu-4.5 at.% Si alloy at moderate temperatures ($T \sim 0.4 T_m$) in order to obtain further data on solute pinning of dislocations. It was observed that segregation occurs during the waiting time of dislocations in front of obstacles, that is of 'forest trees'. This concept agrees with recent models of the Portevin-Le Chatelier effect slowing down of the relaxation is a precursor of this effect. Pinning corresponds to a slight change in the obstacles: 50% spreading with a few % increase in height. If segregation is due to the Suzuki effect as expected from static ageing studies, diffusion of a few solute atoms is sufficient to achieve this obstacle change; this type of interaction might also explain segregation speed. (17 refs.)

77654 Grain-coarsening resistance and the stability of second-phase dispersions in rapidly solidified steels. G.B.Olson, H.C.Ling, J.S.Montgomery, J.B.Vander Sande, M.Cohen (MIT Cambridge, MA, USA). *Rapidly Solidified Amorphous and Crystalline Alloys*, Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.355-62. Control of alloy composition and processing to achieve grain coarsening resistance in rapidly solidified alloys is examined via the theory of grain boundary pinning and particle coarsening. The principles are illustrated for the case of manganese sulfides in steels. A thermodynamic survey of potential stable dispersed phases identifies TiN and rare-earth sulfides as particularly promising for alloy development via rapid solidification. (24 refs.)

81.40 TREATMENT OF MATERIALS AND ITS EFFECTS ON MICROSTRUCTURES AND PROPERTIES

77655 Studies of epoxy resin systems. I. A study of the origins of the secondary relaxations of epoxy resins by thermally stimulated depolarization. T.D.Chang, S.H.Carr, J.O.Brittain (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).

Polym. Eng. & Sci. (USA), vol.22, no.18, p.1205-12 (Dec. 1982). The relaxation behavior of several epoxy resin systems, which have systematic structural differences, has been studied by the thermally stimulated discharge (TSD) technique. Two TSD peaks centered at about 115K (γ peak) and 185K (β peak) were found for epoxy resins cured with a diamine. Structural change, either in the epoxy resin molecule or the amine molecule, did not seem to affect these two peaks. The TSD thermogram of the DGEBA (diglycidyl ether of bisphenol A) epoxy resin part only showed a small new peak at 160K instead of the β peak at 185K. This result, together with the fact that postcuring increased β peak height, leads to the conclusion that the β peak is most likely due to the newly-created molecular segment during the curing reaction. The peak at 160K was assigned to the epoxy group. This assignment was based on the fact that the 160K peak of an epoxy homopolymer, which has fewer epoxy groups, was smaller than that of the parent DGEBA. The β and γ peaks were found to be of distributed characteristics, and the distribution of activation energy was studied by the partial heating method. (24 refs.)

77656 Studies of epoxy resin systems. II. Effect of crosslinking on the physical properties of an epoxy resin. T.D.Chang, S.H.Carr, J.O.Brittain (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA). *Polym. Eng. & Sci. (USA)*, vol.22, no.18, p.1213-20 (Dec. 1982). For pt.I see *ibid.*, vol.22, p.1205 (1982). An epoxy system consisting of diglycidyl ether of butanediol, DGEBA, cured with 4,4'-diaminodiphenyl sulfone, DDS, has been used for a study of the effect of crosslinking density on the properties of the epoxy resin. Because of the low curing rate at room temperature and the low glass-transition temperature this system was amenable to a wide range of controlled crosslinking density. The crosslinking density was monitored by FTIR (Fourier transform infrared spectroscopy), which followed the change in concentration of the epoxy groups during the curing reaction. The bulk density was found to increase linearly with the crosslinking density. The modulus, the upper yield point, the lower yield point, and the degree of retraction of a deformed sample all increased with the degree of crosslinking. The thermally stimulated depolarization (TSD) β -peak was found to vary with crosslinking density, but the γ -peak was not changed. The TSD α -peak was found to decrease in strength, but increased in temperature as the crosslinking density increased. This observation suggests that TSD measurements are a good monitor of crosslinking density of epoxy resins, particularly near the final stage of the crosslinking reaction. (24 refs.)

77657 Studies of epoxy resin systems. III. Effect of sub- T_g aging on the physical properties of a fully cured epoxy resin. T.D.Chang, J.O.Brittain (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA). *Polym. Eng. & Sci. (USA)*, vol.22, no.18, p.1221-7 (Dec. 1982). For pt.II see *ibid.*, vol.22, p.1213 (1982). The effect of sub- T_g aging on the properties of an epoxy resin system, diglycidyl ether butanediol, DGEBA, cured with 4,4'-diaminodiphenyl sulfone, DDS, has been studied. Aging was found to increase the DSC (differential scanning calorimetric) endothermic peak, the density, and the upper yield point. In contrast, the lower yield point was relatively unchanged. This result, together with the observation of the elimination of the DSC endothermic peak by deformation and the absence of a yield point after deformation, suggested that the aging effect was eliminated by deformation. The thermally stimulated depolarization (TSD) α -peak was found to decrease in strength with aging time. All of the observations were best rationalized on the basis of the free-volume concept. (26 refs.)

77658 Studies of epoxy resin systems. IV. Fracture toughness of an epoxy resin: a study of the effect of crosslinking and sub- T_g aging. T.D.Chang, J.O.Brittain (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).

Polym. Eng. & Sci. (USA), vol.22, no.18, p.1228-37 (Dec. 1982). For pt.III see *ibid.*, vol.22, p.1221 (1982). The fracture toughness of an epoxy resin system, diglycidyl ether butanediol, DGEb, cured with 4,4'-diaminodiphenyl sulphone, DDS, has been studied by varying the crosslinking density and state of aging. A stable, but rough, crack propagation was observed with specimens that were 99 percent cured and quenched. When the extent of curing was less than 99 percent or the material was aged for more than 20 min at 62°C, crack propagation was of the unstable stick-slip nature. Aging was found to decrease the initiation fracture toughness dramatically, but the arrest fracture toughness was almost unchanged. This result was associated with a change of relaxation strength of the primary, α , transition with aging. An increase of crosslinking density was found initially to reduce the fracture toughness of this epoxy resin, but the fracture toughness increased after 87 percent of curing. The initial decrease of the fracture toughness was attributed to a decrease of relaxation strength of the primary transition (i.e. the area under the α -relaxation peak), while the increase of the fracture toughness after 87 percent curing was explained by the onset of the stable-rough crack propagation. Micrographs taken by scanning electron microscopy showed possible existence of blunting during crack propagation and a decrease of blunting with the extent of aging. (20 refs.)

77659 Algorithms for constructing spline regression polynomial models [material science data]. B.Ya.Oleksiv, B.A.Popov (G.V. Karpenko Physico-mech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.366-70 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.85-90 (July-Aug. 1982). [received: May 1983]

Proposes an adaptive algorithm for the construction of spline regression polynomial models for the computer. The selection of the nodes of the spline was done based on the condition of adequateness of the polynomial models with maximum lengths of the members of the spline. The adequateness (correspondence to experimental results) of the models is checked based on the Fisher F-criterion, the nature of which includes comparison of the dispersion of the two normal samples. (16 refs.)

77660 Analysis of a rapidly solidified high-phosphorus austenitic steel containing an amorphous phase. T.F.Kelly, G.B.Olson, J.B.Vander Sande (MIT, Cambridge, MA, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.343-7.

Rapid solidification of a high-phosphorus austenitic steel produces a fine cellular solidification structure containing an amorphous phase at the cell walls. The amorphous phase, which is stable to $\sim 500^\circ\text{C}$, is enriched in phosphorus and chromium, but contains significantly less phosphorus than conventional glass-forming alloys. Hot consolidation of powders produces a chemically-uniform metastable austenite which can be effectively precipitation hardened by phospho-carbides. (8 refs.)

77661 Structure/property relationships and applications of rapidly solidified aluminum alloys. C.M.Adam (Government Products Div., Pratt & Whitney Aircraft, West Palm Beach, FL, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.411-22.

Pratt & Whitney Aircraft has developed rapid solidification powder metallurgy and consolidation techniques to produce advanced aluminum alloys. A centrifugal rotary atomization device with forced high velocity helium convective cooling has been developed to pilot-plant stage, to produce aluminum alloys of novel compositions for advanced gas turbine engine applications. Rapidly solidified aluminum alloys solidify as spherical droplets up to 100 μm diameter with cooling rates of 10^3 - 10^4K/sec , and demonstrate new microstructural features which have been exploited to develop elevated temperature mechanical properties. Alloys have been developed for 400-500°F fan and compressor applications that have traditionally used titanium alloys, and the author reviews the microstructural evolution of rapidly solidified structures during thermomechanical processing. 77662 Strengthening mechanisms in hot-rolled magnesium and magnesium alloys. G.Sambasiva Rao, Y.V.R.K.Prasad (Dept. of Metall., Indian Inst. of Sci., Bangalore, India).

Mater. Lett. (Netherlands), vol.1, no.5-6, p.171-4 (April 1983). The relative contributions of various strengthening mechanisms such as grain-boundary strengthening, texture strengthening and solid-solution strengthening in hot-rolled Mg, Mg-12.5Li, Mg-5Ti and Mg-12.7Cd (at.%) are investigated. Grain-boundary strengthening and texture strengthening are found to be significant in magnesium, whereas in Mg-5Ti the former is more important and in Mg-12.7Cd the latter. The addition of Li, Ti or Cd causes solid-solution strengthening primarily due to differences in atomic size. (14 refs.)

77663 Toughening by monoclinic zirconia. H.Ruf, A.G.Evans (Dept. of Materials Sci. & Mineral Engng., Univ. of California, Berkeley, CA, USA). *J. Am. Ceram. Soc. (USA)*, vol.66, no.5, p.328-32 (May 1983). The toughening induced by monoclinic ZrO_2 in the absence of microcracking was investigated, using ZnO as the host material. Toughness levels K_{IC} in excess of the host toughness K_{IC}^M were achieved, attaining a peak toughness $K_{IC}/K_{IC}^M \approx 1.7$, at monoclinic ZrO_2 volume concentrations ≥ 0.2 . This toughening is attributed to crack/particle interactions, associated with the deflection and bowing of the crack by the residual strain field around the monoclinic ZrO_2 particles. (20 refs.)

77664 Effects of the quenching conditions on the growth of GP zones in Al-Zn alloys. M.Ohta (School of Engng., Okayama Univ., Okayama, Japan), T.Kanadani, A.Sakakibara.

J. Jpn. Inst. Met. (Japan), vol.47, no.5, p.375-81 (1983). In Japanese. Dilute Al-Zn alloys (4 wt.%) quenched under various conditions were studied by measurement of electrical resistivity. In order to compare the results for different quenching conditions correctly, the same specimen was used repeatedly throughout the experiments for the same aging temperature. Intensities of SAXS were also measured. When the aging temperature was fixed,

the quasi-equilibrium resistivity, ρ_E , increased with the quenching temperature, T_Q . Guinier radius, R_G , became smaller as ρ_E became larger when $T_Q \leq 773\text{K}$, while the integrated intensity remained constant. For $T_Q \geq 823\text{K}$, R_G at the state of ρ_E was about 1.15 nm irrespective of the aging and quenching temperature and was a little larger than that at the stage of maximum resistivity. When ρ_E was plotted against ρ_0 (as-quenched resistivity) for a fixed aging temperature, instead of plotting against T_Q , ρ_E relates to ρ_0 regularly. ρ_E depends on ρ_0 linearly with large slope in the region of lower ρ_0 (lower T_Q), on the other hand, with small slope in the region of higher ρ_0 (higher T_Q). In the case of $T_Q \geq 673\text{K}$, ρ_0 increased with increasing quenching speed and ρ_E increased with ρ_0 , that is, with increasing quenching speed. On the other hand, when $T_Q \geq 773\text{K}$, ρ_0 increased with decreasing quenching speed, while ρ_E increased with ρ_0 . ρ_E values corrected for the contribution of secondary defects were almost independent of ρ_0 when aged at 263K, but when aged at 233K, ρ_E depends upon ρ_0 even at higher T_Q . (12 refs.)

77665 Strengthening mechanisms in Inconel 718 superalloy. M.C.Chaturvedi, Ya-fang Han (Dept. of Mech. Engng., Univ. of Manitoba, Winnipeg, Canada).

Met. Sci. (GB), vol.17, no.3, p.145-9 (March 1983). The yielding behaviour of underaged Inconel alloy 718, which is precipitation hardened by coherent ordered BCT γ'' and ordered FCC γ' phases, has been studied. It was found that the yielding of the underaged specimens occurs by the shearing of the precipitate particles by the glide dislocations which move in pairs. During this stage the yield strength of materials can be adequately accounted for mainly by the coherency hardening mechanism. (22 refs.)

77666 Carbon content of retained austenite in quenched steels. H.K.D.H.Bhadeshia (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).

Met. Sci. (GB), vol.17, no.3, p.151-2 (March 1983). Much effort has recently been directed towards the determination of the carbon content of retained austenite in directly quenched, or quenched and tempered low alloy steels. The results indicate that it may be significantly higher than the average carbon content of the alloy concerned. The author's analysis is concerned with the possibility that some redistribution of carbon may occur during the transformation of austenite to what is generally referred to as 'lath martensite' in low alloy steels. It is shown that the experimental results on martensite may only be claimed to be consistent (without proving) with carbon diffusion during growth if, and only if, some factor other than carbon redistribution, e.g. mechanical stabilization, prevents the residual austenite from undergoing displacive transformation. 77667 Investigation of the structure and phase composition of a stainless steel wire after electroplastic drawing. O.A.Troitskii, Yu.V.Baldokhin, N.E.Kir'yanchev, V.G.Ryzhkov, V.D.Kalugin, N.V.Sokolov, A.A.Klekovkin, S.A.Klevtsur (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.744-8 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A confirmation is reported of an earlier observation by the present authors that electroplastic drawing (during which a constant current of high density amounting to 250 A/mm² passed through the deformation zone) of a wire made of metastable austenitic stainless steel reduced strongly the content of the martensite formed as a result of deformation of the α phase. The distribution of the residual α -phase over the wire cross section was determined. The results indicated that this residual α -phase was concentrated mainly on the surface and was present in the form of disperse inclusions. (7 refs.) A.T.

77668 Influence of the temperature and rate of deformation on the dynamic recrystallization of KhN77TiYr alloy single crystals. N.D.Bakhteeva, V.I.Levit (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.761-7 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The investigated single crystals were oriented to ensure easy slip and elongation tests were made at temperatures 1273-1473K at shear deformation rates from 10^{-3} to 10^{-1}sec^{-1} . Softening in accordance with the dynamic recovery mechanism was observed under all stretching conditions. Dynamic recrystallizations occurred only at 1373 and 1473K and the degree of such recrystallization in single crystals increased on increase in the temperature and on reduction in the deformation rate. (14 refs.) A.T.

77669 Characteristics of recrystallization of ultrafine powders during sintering. Ya.E.Geguzin, L.N.Parititskaya, V.V.Bogdanov, V.I.Novikov (A.M. Gorki State Univ., Kharkov, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.768-73 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

During the initial stage of sintering of ultrafine Cu and Ni powders with a linear grain size $l \approx 5 \times 10^{-8}\text{m}$ it was found that low-temperature recrystallization occurred at $T \geq 200^\circ\text{C}$. This process produced spherical (radius $\sim 10^{-5}\text{m}$) single-crystal inclusions, i.e. inclusions consisting of $\sim 10^9$ powder grains. A model was proposed for this process: according to this model the recrystallization motion of the boundaries is hindered by the detachment of atoms from one wall of a boundary and the attachment to the other. The kinetics of this process can be described by a specific boundary flux of particles. (3 refs.) A.T.

77670 Calculations from texture of earing in deep drawing for FCC metal sheets. N.Kanetake, Y.Tozawa, T.Otani (Dept. of Iron & Steel Engng., Nagoya Univ., Nagoya, Japan).

Int. J. Mech. Sci. (GB), vol.25, no.5, p.337-45 (1983).

The present study aims to calculate the height at each peripheral position of a cup drawn from polycrystalline sheet using texture data. In the analytical treatment the polycrystalline sheet is simplified to an aggregation of many single crystals with various orientations, and the texture is represented by a three-dimensional crystallite orientation distribution function. The ear is calculated crystallographically using the orientation distribution function as a volume fraction of a certain oriented crystal. In the experiment aluminium, Al-Mg alloy and copper sheets which are treated under various conditions of cold rolling and heat treatment are used. The average textures over the

thicknesses of the sheets are measured by the Schulz reflection method. The calculated ears based on the measured textures are compared with the experimental ears for each material. The results show that all the principal features of the ears of drawn cups are predicted satisfactorily by the calculation. (22 refs.)

77671 Austenitising process of steels and effect of plastic deformation on the process. I.Tamura (Faculty of Engng., Kyoto Univ., Kyoto, Japan). *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.352, p.1-5 (Jan. 1983). In Japanese.

Dual phase steel, having both ferritic and martensite structures, has achieved commercial importance in the manufacture of automobiles. It is low in yield point and high in tensile strength, uniform elongation percentage and work hardening—good workability. When cold-rolled steel is heated and then rapidly cooled, the steel changes over from austenite into martensite, and the final steel contains ferrite and martensite crystals. In this phase transformation the austenitising process plays an important role. Austenite is a solid solution of ferrite and cementite in each other. It forms when the metal solidifies, and remains a solution until it cools to a red heat. But manganese, nickel or carbon contained in the steel will preserve austenite to a temperature below -195°C . The paper describes the austenitising process. (6 refs.) K.B.

77672 Structural dependence of microscopic residual shear stress at worked surface. T.Hanabusa, H.Fujiwara (Faculty of Engng., Tokushima Univ., Tokushima, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.245-50 (March 1983). In Japanese.

Describes the structural dependence of ψ -splitting behavior observed in the X-ray stress measurement of worked surfaces. In order to investigate at first the effect of the cementite phase on the X-ray residual strain distribution, the lattice spacings at many orientations (ϕ, ψ) were measured for the ground or orthogonally planned surfaces of annealed S55C and pure iron. The variation of measured interplanar spacing against $\sin^2\psi$ for S55C was closely approximated by the following fundamental triaxial stress-strain relation: $\epsilon_{\psi\psi} = \frac{1}{2} s_1^2 [\sigma_1 \cos^2\phi + \sigma_2 \sin^2\phi + \sigma_{22} \sin^2\psi - \sigma_{33} \sin^2\psi + \frac{1}{2} s_2 s_3 + s_1 [\sigma_{11} + \sigma_{22} + \sigma_{33}] + \frac{1}{2} s_2 [\sigma_1 \cos^2\phi + \sigma_2 \sin^2\phi] \sin^2\psi]$. However, the values for pure iron showed remarkable deviations from the elliptical distribution in the $\sin^2\psi$ diagram because of sharp preferred orientations produced by hard mechanical working. Secondly, the effect of morphology of the cementite phase on the $\sin^2\psi$ diagram was investigated for SK 3 specimens which were prepared by four different heat treatments in order to include the spheroidized structure and the pearlite structure. (19 refs.)

77673 Properties of γ/γ' - δ eutectic composite material. K.Kovacova (Ustav Materialov a Mechaniky Strojov SAV, Bratislava, Czechoslovakia), J.Ivan, S.Kubo.

Kovove Mater. (Czechoslovakia), vol.21, no.2, p.189-96 (1983). In Slovak.

The minimum interphase free energy is one of the basic features of morphological stability conditioning the formation of a certain preferred orientation relation among the coexisting phases in the eutectic composite material. In the Ni-Ni₃Al-Ni₃Nb ternary eutectic material prepared by the unidirectionally controlled solidification the mutual crystallographic orientation of phases was determined and relative solubility of elements in the phases was assessed. In Ni-Nb 22.5-Al 2.5 wt% monovariant ternary alloy in the interval of directional solidification rates from 1.44×10^{-6} to $5.56 \times 10^{-6} \text{ m.s}^{-1}$ the following generally valid orientation relation exists: lamellar interphase $\{111\}_\gamma, \{101\}_\delta$ growth direction $\parallel [110]_\gamma, \parallel [100]_\delta$, which is not a function of the growth rate. In the Ni-Ni₃Al-Ni₃Nb eutectic composite material the solubility of nickel in the matrix is by 20% higher when compared to its solubility in the reinforcing lamella of δ -phase. Solubility of niobium in γ intermetallic phase is twofold when compared to its solubility in the matrix. (10 refs.)

77674 Recrystallization of a nickel-base superalloy: kinetics and microstructural development. A.J.Porter, B.Ralph (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).

Mater. Sci. & Eng. (Switzerland), vol.59, no.1, p.69-78 (May 1983).

The primary recrystallization of a commercial nickel-base superalloy, Nimonic 115, has been investigated. The migration kinetics of the recrystallization interface have been examined by light optical microscopy and hardness testing; the reasons for a high apparent value of activation energy so obtained are discussed. The grain refinement resulting from recrystallization has been studied by transmission electron microscopy. A mechanism, based on enhanced recovery near to the recrystallization interface leading to repeated nucleation of recrystallization, is proposed. (25 refs.)

77675 Relative work hardening rates. R.Rawlings (Dept. of Metall. & Materials Sci., Univ. Coll., Cardiff, Wales).

Met. Sci. (GB), vol.17, no.3, p.150 (March 1983).

The author has collected some results to illustrate the relationship $d\sigma/d\epsilon = TS(1 + e_\sigma)$ where σ and ϵ are the true stress and true strain respectively, TS is the tensile strength and e_σ is the maximum uniform strain. The results are for various materials including high density polyethylene and nylon which show a maximum in the force-extension curve. It can be seen that neither the work hardening nor the relative work hardening ratios at a constant strain are any guide to the maximum uniform strain. (3 refs.)

77676 Static and dynamic strain aging in a Ni(C) solid solution. G.H.van Haastert, A.van den Beukel (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands).

Phys. Status Solidi A (Germany), vol.76, no.2, p.609-14 (16 April 1983).

Static and dynamic strain aging experiments are performed on the interstitial solid solution Ni(0.55% C) to discriminate between two models recently proposed in the literature, the 'dislocation-solute interaction' (DSI) and the 'dislocation-dislocation interaction' (DDI) model. The results can, for the major part, be described in terms of the first model and in some respects clearly disagree with the second. (12 refs.)

77677 The growth of helium bubbles in stainless steel at high temperatures. J.Rothaut, H.Schroeder, H.Ullmaier (KFA Jülich, Jülich, Germany). *Philos. Mag. A (GB)*, vol.47, no.5, p.781-95 (May 1983).

The influence of annealing time (1-1000 hours), applied tensile stress (0-130 MPa), temperature (973-1073 K) and helium content (10-300 a.p.p.m.) on the size distribution and density of helium bubbles within the grains of AISI Type 316 stainless steel has been studied by TEM of α -implanted foil specimens. The results are compared with theoretical predictions assuming different growth mechanisms. The experimental data are best described by assuming that (1) the bubble coarsening is due to Ostwald ripening and (2) the helium in the bubbles obeys a highly non ideal equation of state. From such a comparison an activation energy for helium permeation through the lattice of 3.5 eV can be deduced, which is comparable with theoretical estimates. It was further observed that tensile stresses can lead to bimodal size distributions, which are attributed to the presence of two mobile and supersaturated components (helium and vacancies) during the nucleation stage. The subsequent growth of matrix bubbles seems to be rather insensitive to stress, in contrast to the behaviour of grain boundary bubbles. It could be shown that, within

the covered parameter range, the implanted helium is entirely precipitated into bubbles with diameters $\geq 1.5 \text{ nm}$ that are detectable by TEM. (13 refs.)

77678 Influence of aging on secondary recrystallization and mechanical properties of polycrystalline NaCl samples prepared by hot pressing. S.N.Val'kovskii, M.F.Imaev (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).

Sov. Phys.-Solid State (USA), vol.24, no.11, p.1832-4 (Nov. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.11, p.3229-33 (Nov. 1982). [received: May 1983]

A study was made of the influence of room-temperature aging on the yield stress and on the parameters of secondary recrystallization of polycrystalline samples formed by hot pressing. After aging for nearly a year a considerable reduction (by over an order of magnitude) was observed in the activation energy of motion of grain boundaries and of the yield stress. The reduction was by a factor of ~ 3 . Crystals with different grain sized obeyed the Hall-Petch relationship in which the constant was $K = 0.82 \text{ MPa.cm}^{1/2}$. (15 refs.)

77679 Preferred orientation in splat-quenched materials. N.W.Blake, F.A.Hames, R.W.Smith (Dept. of Metall. Engng., Queen's Univ., Kingston, Ontario, Canada).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.363-7

High purity, splat-quenched metal ribbons, produced by the melt spinning technique, were examined for preferred orientation using X-ray diffraction. Of the materials tested (Zn, Cd, Ag, Bi, Pb, Sb, Mg, Sn), all except Sn exhibited some degree of preferred orientation in the plane of the metal ribbon. The HCP metals Zn and Cd showed an extreme degree of preferred orientation with the 002 plane being closely parallel to the ribbon plane. The Zn ribbon was analysed more closely with a view to its use as a crystal monochromator for X-ray diffraction. The high purity Zn was found to have some instability of preferred orientation with increase in time and temperature. The orientation was found to be effectively stabilized by the intentional addition of impurities, or by the use of lower purity Zn. In this form, the Zn ribbon could be used as a crystal analyser for X-ray diffraction with both intensity and resolution comparable to that of the 1011 plane in quartz. (5 refs.)

77680 Influence of heat treatment on the structure and long-term strength of γ/γ' -MeC nickel eutectic. Length memory effect. S.T.Kishin, I.L.Svetlov, L.P.Sorokina, S.G.Morozova, E.R.Golubovskii, F.V.Yushakova (All-Union Sci.-Res. Inst. of Aviation Materials, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.754-60 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of the effects of heat treatment on the structure, phase composition and long-term strength (measured at $900-1100^{\circ}\text{C}$) of a nickel-based eutectic with a directional γ/γ' -MeC structure. It was found that quenching from the temperature of complete dissolution of the γ' -phase and ageing at 900°C for 30 h ensured the optimal size and morphology of the γ' -phase. This increased the long-term strength measured at 900 and 1000°C . Repeated heat treatment after tests of certain durations restored the initial structure, mechanical properties, and dimensions of the samples. (8 refs.) A.T.

77681 Characteristics of formation of the structure during deformation of low-alloy chromium by rolling at temperatures 1400-1450K. V.I.Trefilov, N.A.Storchak, V.N.Minakov, V.A.Manilov, L.S.Igolkina, Yu.E.Zubets (Inst. of Problems in Materials Sci., Acad. of Sci., Kiev, Ukrainian SSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.4, p.781-7 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The methods of X-ray structure investigations and electron transmission spectroscopy were used to study the formation of the structure in polycrystalline samples of low-alloy chromium as a result of a change of the degree of single plastic deformation by rolling at $1400-1450\text{K}$. It was found that when the degree of plastic deformation was in excess of 30% per rolling, the process could be described by the following scheme: initial structure—cellular structure—fragmented+cellular structure. (20 refs.) A.T.

77682 Annealing behaviour of dilute FeTi, FeCu, and FeMn alloys in the temperature range above stage III following low-temperature electron irradiation. F.Walz (Inst. fur Phys., Max-Planck-Inst. fur Metall., Stuttgart, Germany), H.J.Blythe, F.Dworschak.

Phys. Status Solidi A (Germany), vol.76, no.1, p.267-76 (16 March 1983).

The annealing behaviour of the dilute iron-based alloys FeCu, FeTi, and FeMn following low-temperature (44K) irradiation with 3 MeV electrons is investigated in the temperature range above stage III (200K) by means of magnetic after-effect measurements. The development of higher temperature ($T > 200\text{K}$) relaxation processes upon annealing is interpreted in terms of a two-interstitial model assuming interstitial clustering. This model is further supported by the occurrence of low-temperature ($T < 20\text{K}$) orientation-type processes in FeTi, FeNi, and FeSi which, following a detailed analysis, are

attributed to trapping reactions between mobile impurity interstitials and immobile vacancies resulting in the formation of anisotropic impurity interstitial-vacancy complexes. (16 refs.)

77683 Heating of a thin wire by a constant current with density sufficient for the appearance of thermoplasticity. O.A.Troitskii (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.8, p.648-9 (Aug. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.265, no.4-6, p.1131-3 (Aug. 1982). [received: May 1983]

The transport of heat within a wire is described by Fick's heat-conduction equations. At the metal-water interface the heat-conduction flux is coupled with the flux through the surface on account of heat transfer into the liquid. The author constructs a formula which relates the rate of plastic deformation of a wire, heated by a current, to experimentally measurable quantities—the average stress $\bar{\sigma}$, the current density (in terms of T), and the constants of the metal. With the use of this formula it is not difficult to calculate the rates of deformation of the wire for various current densities and at the average temperature estimated from formula. The main effect in these expressions for the temperature and stress is the heat transfer from the surface where the jump in the temperature is localized. (1 ref.)

77684 Effect of heat treatment on the distribution of elements in the phase components of a W-Ni-Fe alloy. V.G.Bukato, V.M.Romashov, Yu.V.Gostev (All-Union Sci.-Res. & Design Inst. of Refractory Metals & Hard Alloys, USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.10, p.785-8 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.38-41 (Oct. 1982). [received: May 1983]

A study was made of the effect of various heat treatments on the distribution of elements between the tungsten phase and matrix grains in specimens of W-Ni-Fe. Unetched microsections of alloy specimens were examined using an electron probe microanalyzer. The observed redistribution of elements in the alloy investigated was apparently due not only to the temperature dependence of the solubilities of the components in the phases but also to the fact that an equilibrium had not been attained in its structural constituents during sintering and heat treatment.

77685 Application of neutron diffraction to a study of phases in Type 316 stainless steel weld metals. G.F.Slattey, C.G.Windsor. Report ND-R-880(R), UKAEA, Risley, Lancs, England (Jan. 1983), 33 pp. Neutron diffraction techniques have been utilised to study the phases in Type 316 austenitic stainless steel weld metal both in the as-welded condition and after stress-relieving and ageing heat treatments. The amounts of the principal crystallographic phases present in bulk specimens have been measured. Two compositions of weld metal were selected to provide a 'low' (6%) and 'high' (16%) initial ferrite level and the subsequent volume fractions of transformation products were measured after heat treatment. Some retained ferrite was observed in all the heat treated specimens, ranging from 4% for specimens of both initial ferrite levels treated at 625°C for 1000 hours, to around 1% for the specimens treated at 850°C for 6 hours. The high initial ferrite specimen produced 0.9% of sigma phase after the 850°C treatment and 0.2% sigma after the 625°C treatment. The low initial ferrite specimen produced 1.5% $M_{23}C_6$ carbide after both heat treatments. The results compare well with previous findings on similar samples of weld metal using optical and electron microscopy. (35 refs.)

77686 Investigation of capless heat treatment of MBE n-GaAs. S.H.Xin, W.J.Schaff, C.E.C.Wood, L.F.Eastman (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).

Gallium Arsenide and Related Compounds, 1982. Tenth International Symposium on Gallium Arsenide and Related Compounds, Albuquerque, NM, USA, 19-22 Sept. 1982 (Bristol, England: IOP 1983), p.613-18

Both capless and Si_3N_4 capped annealing of molecular beam epitaxial n-GaAs were investigated by photoluminescence and computerized deep-level spectroscopy. The 1.507 eV emission bands (defect excitation) and the 1.4934 eV (carbon) and the 0.83 eV (EL2) electron trap are greatly enhanced after Si_3N_4 encapsulated annealing at 700°C. These features were not observed in capless annealed material. It is concluded that capless annealing using an InAs ambient can avoid surface-impurity drive-in and stress effects in the MBE film. In addition Si_3N_4 capping causes surface topographic degradation on annealing whereas capless annealing does not. (15 refs.)

81.40J Elasticity and anelasticity

(see also 62.20D Elastic constants, 62.40 Anelasticity, internal friction, and mechanical resonances)

77687 X-ray stress measurement of high manganese austenitic steels. H.Miyagawa, S.Oyama, A.Oda (Ariake Tech. Coll., Omuta, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.240-4 (March 1983). In Japanese.

By using the ψ , oscillation method with $CrK\beta$ γ (311) diffraction, the X-ray stress measurement was made on five specimens, which were obtained by water toughening and various plastic working treatments (tensile pre-strain, hammered and explosive hardening) from Hadfield's high manganese austenitic steel, and their mechanical elastic constants, X-ray elastic constants and the accuracy of measurement were examined. The mechanical elastic constant for 13% Mn austenitic steel after water toughening was 18900 kg/mm². This value gradually decreased with increasing tensile pre-strain. The K -value ($K_X = -37.26$ kg/mm²/deg) of austenitic steel adopted in the standard method of X-ray stress measurement is considered suitable for the X-ray stress measurement of 13% Mn austenitic steel which has not been subjects to severe plastic deformation. (14 refs.)

77688 X-ray stress measurement of coarse grained 18-8 stainless steel by complex oscillation technique. H.Miyagawa, S.Oyama, A.Oda (Ariake Tech. Coll., Omuta, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.292-7 (March 1983). In Japanese.

With the $CrK\beta$ γ (311) diffraction plane, the X-ray stress measurements on coarse grained 18Cr-8Ni austenitic stainless steel was carried out by the complex oscillation technique using the $\phi\theta$ oscillation and specimen oscillation at the same time, and the accuracy of the measurements and the X-ray elastic constant were examined. Using the complex oscillation technique, the stress of 18-8 stainless steel having an average grain size 155 μ m can be measured with the error less than ± 1 kg/mm², if the limit of confidence is set at 95 per cent. The X-ray elastic constant for the material having the average grain size 93 μ m is almost the same as those for the fine grained specimens. But the value of the one with a grain size of 155 μ m is different from these values. (14 refs.)

77689 The elastic constants of ultradrawn polypropylene. W.P.Leung, C.L.Choy (Dept. of Phys., Chinese Univ. of Hong Kong, Hong Kong).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.725-52 (May 1983).

The five independent elastic constants C_{11} , C_{12} , C_{13} , C_{33} , and C_{44} for uniaxially drawn polypropylene with draw ratios $1 < \lambda \leq 20$ have been measured from -40 to 130°C by an ultrasonic method (2.5 MHz). The crystalline and amorphous orientation functions f_c and f_a were also determined from wide-angle X-ray diffraction and birefringence; f_c increases sharply at low λ and becomes saturated above $\lambda=8$, but f_a increases monotonically up to $\lambda=20$. Below the glass transition temperature (ca. 60°C at 2.5 MHz) only the axial longitudinal and tensile moduli, C_{33} and E_{\parallel} , show large increase. At 110°C, however, all the moduli increase with λ ; E_{\parallel} , E_{\perp} (transverse tensile modulus), C_{44} (axial shear modulus), and C_{66} (transverse shear modulus) increase 30, 3, 5, and 2.5 times, respectively, as λ increases from 1 to 20. The improvement in the mechanical properties can be attributed to the increase in the fraction of taut tie molecules which was monitored by f_a . The results were analyzed in terms of the two-phase models of Takayanagi (1966) and Seferis et al. (1976). The effects of porosity were also studied. (41 refs.)

77690 Effect of porosity on the mechanical properties of nitrogen ceramics. J.C.Glandu, P.Boch (Ecole Nat. Supérieure de Ceramique Industrielle, Limoges, France).

Rev. Chim. Miner. (France), vol.20, no.1, p.9-19 (1983). In French.

The porosity dependence of the most important mechanical properties (elastic moduli, strength) of three nitrogen ceramics is studied and the results are discussed in the frame of the usual behaviour laws of the literature. The well-known decrease in mechanical properties when the porosity increases is observed, but it is shown that the amount of porosity is not the single one parameter to take into account because of the importance of other terms (i.e. morphology and nature of pores) dealing with these effects. (27 refs.)

77691 Nonlinear resonance in Cu_3Au . K.Miura, M.Wuttig, T.Yokoyama (Dept. of Mech. Engng., Yokohama Nat. Univ., Yokohama, Japan).

Ser. Metall. (USA), vol.17, no.4, p.427-9 (April 1983).

Presents first measurements of resonance curves in the vicinity of the order-disorder transformation in Cu_3Au and show how they can be understood formally in terms of the nonlinear theory. (21 refs.)

- 77692 Elasticity and anelasticity of a 304 stainless steel at below room temperature.** D.Boothman, L.Verdini (Istituto di Fisica, Univ. di Perugia, Perugia, Italy). *Scr. Metall. (USA)*, vol.17, no.4, p.445-50 (April 1983). A dynamic non-destructive technique developed for and primarily used in the analysis of pure or binary component metals is extended to the case of a complex alloy in order to study the onset of phase transformations and magnetic reorderings. The alloy chosen was a specimen of the well-known commercial 304 stainless steel, containing 18% Cr and 9% Ni. It has been shown that, by exciting flexural vibrations in a steel disc, it is possible to identify the martensitic transformation temperature if the sample has not already been subjected to temperature cycling sufficient to produce a metastable equilibrium concentration of b.c.c. material. (22 refs.)
- 77693 Elastic moduli, hardness and thermal expansion of some metaphosphate glasses.** M.Ashizuka, T.Sakai, A.Iwata (Kyushu Inst. of Technol., Kitakyushu-shi, Japan). *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.2, p.87-94 (1983). In Japanese. Density, elastic moduli, Vickers hardness and thermal expansion coefficients for some metaphosphate glasses have been studied. Two linear relationships existed between mean molar volume and the cube of radii of modifier cation in glasses $(r_{M^{2+}})^3$ for Ca, Sr, Ba, Mg and Zn, and $3(r_{M^{+}})^3$ for Li and Na). One corresponds to normal type glasses (Ca, Sr, Ba, Li and Na groups) and the other corresponds to anomalous type glasses (Mg and Zn groups) proposed by Kordes. It is estimated that anomalous type glasses have more vacant space than normal ones by comparison of these linear lines. There were constant relationships between elastic moduli (bulk modulus K , Young's modulus E , shear modulus G and Poisson's ratio ν) and mean atomic volume V . Two linear relationships existed between Vickers hardness and cation-oxygen attraction $(2Z/d^4)$. (33 refs.)
- 77694 Elastic properties of alkali silicate glasses.** K.Takahashi, A.Osaka (Dept. of Industrial Chem., School of Engng., Okayama Univ., Okayama-shi, Japan). *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.3, p.116-20 (1983). In Japanese. The longitudinal and transverse ultrasonic wave velocities have been measured for the glasses in the systems R_2O-SiO_2 ($R=Li, Na, K$, and Cs) by the pulse transmission method. The velocities and densities measured by the Archimedes method provided the elastic constants of the glasses; the shear modulus G , the bulk modulus K and Young's modulus E . The log-log plot of the bulk modulus vs. the mean atom-pair volumes can be approximated by a line of slope $-4/3$ throughout the glasses investigated. The results are different from those of the glasses in the systems $MO-SiO_2$ reported by Soga et al. (*J. Non-Cryst. Solids*, vol.22, p.67-76, 1976). Based on the previous models of the alkali silicate glasses (Osaka and Takahashi, *Yogyo-Kyokai-Shi*, vol.90, p.703-09, 1982) the relations between the bulk moduli and the volumes have been explained qualitatively in terms of the packing effects of the alkali ions and of the formation of the non-bridging oxygens. The former results in increasing elastic constants and the latter the inverse effect. (13 refs.)
- 77695 Pseudo-elastic behaviour in rapidly-quenched dilute tin alloys.** W.M.Gallerneault, R.W.Smith (Dept. of Metall. Engng., Queen's Univ., Kingston, Ontario, Canada). *Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981* (New York, USA: North-Holland 1982), p.429-32. Ribbons of pure tin (99.9999%) and dilute Sn-Ge alloys, prepared by melt spinning using a 4" diameter copper cylinder, were strained in tension. Reversible strains of a few percent were recorded in the dilute alloys but not in the pure tin. X-ray diffraction examination suggests that this pseudo-elasticity is due to twinning rather than a martensitic transformation. (4 refs.)

81.40L Deformation, plasticity and creep

(see also 62.20F Deformation and plasticity, 62.20H Creep)

- 77696 Diffusive intergranular cavity growth in creep in tension and torsion.** S.E.Stanzl, A.S.Argon, E.K.Tschoeg (MIT, Cambridge, MA, USA). *Acta Metall. (USA)*, vol.31, no.6, p.833-43 (June 1983). Creep experiments were performed at 500°C in tension and torsion on high conductivity copper tubes with a uniform initial coverage of implanted water vapor bubbles on all grain boundaries. The results indicate that the cavities grow in a crack-like mode but at one tenth the rate predicted from the theoretical model of Pharr and Nix. This difference is attributed partly to load shedding from boundaries normal to the maximum principal tensile stress to slanted boundaries, and partly to a lack of knowledge about the surface diffusion constant. The results indicate further that the contribution to intergranular cavity growth by power-law creep is negligible in comparison to the contribution by diffusional flow. Complementary tension and torsion experiments performed in initially uncavitated samples result in shorter creep lives in torsion than in tension due to more effective cavity nucleation in the former. The times of fracture in both of these cases obey Monkman and Grant's law, indicating the presence of constraints on growth by the lagging

deformations by power-law creep in the surroundings of the cavitating isolated grain facets. (32 refs.)

- 77697 A study of intergranular cavity growth controlled by the coupling of diffusion and power law creep.** J.S.Wang, L.Martinez, W.D.Nix (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA). *Acta Metall. (USA)*, vol.31, no.6, p.873-81 (June 1983). A technique based on pre-creeping and sintering is used to create large, widely spaced cavities at grain boundaries in copper. The size and spacing of the cavities is such that cavity growth is expected to be controlled by the coupling of diffusion and power law creep. The rupture properties of these pre-cavitated samples are studied over a range of stresses and temperatures and the results are compared with the predictions of various theoretical treatments of cavity growth. The stress and temperature dependence of rupture can be described using an analysis of the type suggested by Chen and Argon, provided that the diffusional length is based on the ligament stress rather than the applied stress. (13 refs.)
- 77698 Modified method for determination of energy stored in metal during its deformation.** S.P.Gadaj, E.Galkowska, J.Kaczmarek, W.Olifcruk (Acad. Polonaise des Sci., Warsaw, Poland). *Bull. Acad. Pol. Sci. Ser. Sci. Tech. (Poland)*, vol.30, no.1-2, p.37-46 (1982). Presents a modified method for the determination of stored energy. This energy is found as the difference of the mechanical energy supplied to the tensioned metal sample and the heat released during its deformation. The modification consists in the fact that the heating process due to increasing extensile stress is simulated by electrical energy supplied in a controlled way. Thus, it is possible to determine the amount of heat released by the sample without introducing any coefficients of heat exchange with the surrounding. Advantages and disadvantages of this modified method are discussed and compared to calorimetric methods. Stored energy is determined as a function of deformation of tensioned 1KH18N9T steel. The analysis of errors is performed for the results obtained. (1 ref.)
- 77699 Tensile strength of ultra high modulus linear polyethylene filaments.** D.L.M.Cansfield, I.M.Ward, D.W.Woods (Dept. of Phys., Univ. of Leeds, Leeds, England), A.Buckley, J.M.Pierce, J.L.Wesley. *Polym. Commun. (GB)*, vol.24, no.5, p.130-1 (May 1983). The tensile stress-strain behaviour of ultra high modulus linear polyethylene has been shown to be very dependent on strain rate. At room temperature, a transition from ductile to brittle behaviour was observed at $\sim 10^3$ s, and the tensile strengths of the comparatively low molecular weight material examined increased to 1.4 GPa at high strain rates at -10°C . (3 refs.)
- 77700 High-temperature creep and dislocation structure of vanadium.** V.M.Alyab'ev, O.V.Antonova, L.N.Lebeleva, V.A.Pavlov, V.I.Shalaev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.798-804 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A study was made of the creep of vanadium in annealed and hardened (by a mechanothermal treatment) states. The processes of formation of a dislocation structure during this mechanothermal treatment were investigated and changes in the structure during creep were observed. The mechanisms of creep were analysed and the factors responsible for an improvement in the refractory properties as a result of the treatment were considered. (21 refs.) A.T.
- 77701 Nature of the anomalous spontaneous deformation of iron in the presence of hydrogen.** V.I.Shapovalov, V.Yu.Karpov (Metall. Inst., Dnepropetrovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.805-10 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. It has been established that an anomalous spontaneous deformation due to a polymorphic transformation in the presence of H is not exhibited by metals forming hydrides. This effect appears in iron and its alloys, and also in manganese. A mechanism is proposed for this effect: when a polymorphic transformation occurs in the presence of hydrogen, a layer appears at the boundary between the growing and disappearing phases and this layer is strongly supersaturated with hydrogen. Experimental data (derived from microstructure investigations and cooling curves) and theoretical arguments are given in support of the proposed explanation. (10 refs.) A.T.
- 77702 High-temperature shape memory in titanium nickelide.** V.A.Likha-chev, M.V.Masterova (A.A. Zhdanov State Univ., Leningrad, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.814-16 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. Titanium nickelide (TiNi) was alloyed with iron in order to reduce the martensitic transformation temperature. It was found that the high-temperature shape memory effect was due to certain reactions and particularly due to a transition from one form of the nickelide to another. All the experiments were carried out in the torsion regime. (4 refs.) A.T.
- 77703 Influence of plastic deformation on the properties of chromium bronze.** Yu.D.Koryagin, N.T.Kareva, M.A.Smirnov (Lenin Komsomol Polytech. Inst., Chelyabinsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.4, p.823-6 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. Mechanical properties were investigated of an alloy based on Cu and containing 0.38%Cr and 0.1% each of Ni and Fe. The alloy was subjected to plastic deformation at temperatures 20-600°C. Changes in the lattice constant and in the mechanical properties were determined. It was found that hardening resulted from rolling at 20 and 500°C involving compression by 70%. Plastic deformation affected also the nature of fracture. (4 refs.) A.T.
- 77704 A viscous shell formulation for the analysis of thin sheet metal forming.** E.Onate (ETS Ing. de Caminos, Univ. Politecnica de Barcelona, Barcelona, Spain), O.C.Zienkiewicz. *Int. J. Mech. Sci. (GB)*, vol.25, no.5, p.305-35 (1983). A finite element method to analyse large plastic deformations of thin sheets of metal is presented. The formulation is based on an extension of the general viscoplastic flow theory for continuum problems to deal with thin shells. Axisymmetric situations are considered first and here the simple two noded reduced integration element is used. Numerical results for the stretch forming and deep drawing of circular sheets are presented and comparisons with experimental results are made. The second part of the paper deals with the deformation of sheets of arbitrary shape. The general viscous shell element is derived from the standard reduced integration, 'thick shell' element. Numerical results for simple 3-D sheet forming problems are given. (63 refs.)
- 77705 Measuring temperature dependence of secondary forming behavior of cellular polystyrene sheets.** K.Ito, O.Yatabe, M.Tsutsui (Coll. of Engng., Hosei Univ., Tokyo, Japan), H.Fujiaki. *Int. J. Polym. Mater. (GB)*, vol.10, no.1, p.39-52 (1983). A modified Erichen testing apparatus with heating chamber was used for evaluating the temperature dependence of the post-forming ability of foamed polystyrene sheet. Circular sheets (90 mm diameter) of thickness (1.5 mm-2.4 mm) were used as test specimens. The fracture of sheet specimens at a

hemi-spherical punch corner was observed through an upper glass plate during the punch penetration travel. (16 refs.)

77706 Spall studies of differently treated 2024A1 specimens. Z.Rosenberg, G.Luttwak, Y.Yeshurun, Y.Partom. *J. Appl. Phys. (USA)*, vol.54, no.5, p.2147-52 (May 1983). Commercial manganin stress gauges are used in planar impact experiments to determine spall strengths of variously heat-treated 2024A1 specimens. A one-dimensional Lagrangian code is used to find the best fit of calculated versus experimental stress histories by varying the spall strength in the code and using a simple threshold criterion. The authors found values in the range of 1.2-1.75 GPa for spall strengths of the differently treated specimens. These values are in good agreement with published data obtained by other methods. They also confirmed the spall strength values by a series of low-stress experiments resulting in only incipient spalls. A specimen of 2024T351 which was shocked perpendicular to the rolling direction has a lower spall strength (by about 0.3 GPa) than a specimen shocked along the rolling direction. This difference is very close to that predicted earlier. (16 refs.)

77707 The analysis of dislocation networks formed in Zircaloy-4 during high temperature creep. I.Armas, M.Boeck (Inst. für Material- und Festkörperforschung II, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.263-70 (April 1983). A TEM analysis of the Burgers vectors of hexagonal network dislocations in Zircaloy-4 crept at 800°C has shown that these networks are formed by parallel sets of predominantly screw dislocations with an $\langle a \rangle$ type Burgers vector. These dislocations lie in intersecting {1010} prism planes, however, the networks themselves form by interaction in the basal plane. The main glide system in Zircaloy-4 at 800°C is the prism system $\{10\bar{1}0\}$; $1/3\langle 1120 \rangle$ which is also the operative system at low temperatures. Hence the networks formed in the {0001} plane are obviously non-glide in this plane. Especially at higher temperatures however the networks can easily leave the basal plane. Mechanisms are proposed to explain the lack of edge dislocations in the crept specimens. (7 refs.)

77708 Thermal stress measurements of tungsten fiber-copper composites. Y.Ikeuchi (Niihama Tech. Coll., Niihama, Japan), H.Fujiwara. *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.354, p.271-6 (March 1983). In Japanese. Thermal stress behaviors of tungsten fiber-copper composites have been studied in situ by means of an X-ray diffraction technique. The composites with 50 vol.% and 100 μ m diameter tungsten wires were fabricated by a liquid infiltration technique followed by hot rolling. The X-ray diffraction technique was found to be an effective method to analyze the thermal stress of the composites, and both the matrix and the fiber stresses which were generated due to thermal expansion mismatch of the components could be measured in situ. Both the matrix and the fibers deformed so as to accommodate thermal expansion mismatch when the composites experienced a temperature change. On thermal cyclic of 282K-503K, the matrix deformed plastically and a steady state of the thermal stress-temperature hysteresis loop was achieved after only a few cycles. (13 refs.)

77709 Rectangular tubular steel columns loaded biaxially. Z.Razzaq (Dept. of Civil Engng., Old Dominion Univ., Norfolk, VA, USA), W.W.McVinnie. *J. Struct. Mech. (USA)*, vol.10, no.4, p.475-93 (1982-1983). An inelastic analysis of rectangular tubular steel columns subjected to a constant axial load and a gradually increasing biaxial end moment is presented. Analytical thrust-moment-curvature relationships are given for the cross section with bilinear material stress-strain characteristics. An iterative procedure based on column deflection curves is used to predict moment-deflection curves up to collapse, and numerical examples are given for square and rectangular tubular steel columns. The interaction of biaxial moments, as well as the effect of strain-hardening, is explained for the nonproportional loading considered. The technique can be modified for beam-columns with other types of end moments. (9 refs.)

77710 Creep of 0.6Cr-0.6Mo-0.3V steel at low stresses. V.Foldyna (Vyzkumne Ustavy, Koncern Vitkovice, Ostrava, Czechoslovakia), A.Jakobova, J.Fiala, V.Sklenicka, J.Novotny, J.Cadek. *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.158-68 (1983). In Czech. In the temperature and applied stress region typical for the exploitation of the contemporary power plants the diffusion creep of low alloy CrMoV steel was observed to take place, characterized by the applied stress exponent $m \approx 1$ and the activation energy $Q = 176.5 \text{ kJ mol}^{-1}$. This value of Q is close to the activation enthalpy of grain boundary diffusion $\Delta H_B = -1.675 \text{ kJ mol}^{-1}$. Assuming the known diffusion creep mechanisms that could operate the theoretically calculated Coble diffusion creep rates were found an order of magnitude higher than those determined experimentally. The value of activation energy of creep Q , as well as the comparison mentioned above, suggests that Coble mechanism operates under the conditions given, though-because the mean effective grain diameter dependence of creep rate could not be determined—the Nabarro-Herring mechanism or the parallel operation of the Coble and Nabarro-Herring mechanisms cannot be excluded. The threshold stress σ_0 was found proportional to the reciprocal of temperature. In the comparable temperature intervals it is by a factor of 2 to 3 higher than that for alpha iron. (30 refs.)

77711 Mechanical properties and structural stability of alloys. V.Paidar (CSAV, Praha, Czechoslovakia). *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.169-179 (1983). In Czech. Mechanical properties of metals and alloys, for example the flow stress in homogeneous phases, are controlled by the dislocation core structure which is essential for the dislocation mobility in the crystal lattice. It is shown how a useful information on changes in the dislocation core can be deduced from the phase stability and structural data and how the alloying effect on mechanical properties can be predicted. (15 refs.)

77712 The activation area and the activation enthalpy of cadmium single crystals determined during creep. M.Hamersky (Přirodovedecká Fakulta, Univ. J.E. Parkyne, Brno, Czechoslovakia), P.Lukac. *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.180-8 (1983). In Czech. The creep behaviour of cadmium single crystals tested at temperatures between 78K and 383K have been investigated. The influence of the resolved shear stress τ on the activation area can be described by the following relationship $A = C\tau^{-r}$. The temperature dependences of C and r are given where the values of C and r for $T < 78K$ are also included. In the temperature range from 78K to 383K except of 204K the values of C and r can be assumed to be independent of temperature. The temperature dependence of the activation enthalpy is nearly quadratic and can be expressed in the form $\Delta H \sim T^{2.1 \pm 0.2}$. The stress dependence of the activation area can be explained under the assumption that the nonconservative jog motion is the rate controlling mechanism in creep of cadmium single crystals. (14 refs.)

77713 Thermal activation analysis by stress relaxation in some FCC metals. K.K.Ray, A.K.Mallik (Dept. of Metall. Engng., Indian Inst. of Technol., Bombay, India). *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.59-67 (May 1983). An analysis was made to evaluate the values of the activation volume for the forward flow of dislocations in aluminium, copper and nickel from stress relaxation experiments using the equation proposed by Feltham (1961). It was found that the value of the activation volume varies with the chosen time span of the relaxation profile. This variation is explained in terms of the effect of variation in the mobile dislocation density, the effect of a possible variation in the activation volume with effective stress, the influence of backward dislocation flow and the occurrence of dislocation flow by more than one mechanism. A method to determine the activation volume for the forward flow of dislocation accurately is suggested. The results indicate that two rate-controlling energy barriers should be considered in general for the plastic flow in these FCC metals at low temperatures. (31 refs.)

77714 Cold deformation of a nickel-base superalloy. C.Y.Barlow, B.Ralph (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.115-26 (May 1983). An analysis of the low deformation level (less than 5% strain) characteristics of polycrystalline samples of an engineering alloy is presented. The material used was a wrought nickel-base superalloy, Nimonic 80A, the microstructure of which had been modified in a controlled way to give a related series of phase distributions. This allowed the roles of the various microstructural constituents to be assessed. Selected mechanical property data were correlated with the deformation microstructures as determined by transmission electron microscopy. The presence of carbide particles on the grain boundaries was found to affect both the observed deformation patterns and the work-hardening rate. However, although the majority of the dislocation nucleation events occurred at the grain boundaries, the stress-strain characteristics were more sensitive to intragranular than to intergranular microstructures. (33 refs.)

77715 Composition and processing effects on the properties of one-component polyurethanes. S.A.Iobst, H.W.Cox (Polymers Dept., General Motors Res. Labs., Warren, MI, USA). *Polym. Eng. & Sci. (USA)*, vol.22, no.18, p.1177-83 (Dec. 1982). A polyurethane consisting of a poly(propylene oxide) soft segment and a diphenylmethane diisocyanate-hydroquinone di-(β -hydroxyethyl) ether (HQEE) hard block has been characterized over the composition range of 30 to 60 percent hard block. The flexural modulus varied from 60 to 900 MPa over this composition range. The elongation was approximately 250 percent at the lower hard block contents but fell below 100 percent at 60 percent hard block. Differential scanning calorimetric measurements showed that the crystallinity associated with the hard phase increased with increasing hard block content but decreased with increasing cure temperature. The heat sag was found to decrease with increasing hardblock and increase with increasing cure temperature. A material with properties comparable to current fascia materials had a significantly better heat sag resistance than a current RIM (reaction injection molding) polyurethane. The combination of the solid chain extender, HQEE, and a solid catalyst, zinc stearate, yields a resin having a pot life of greater than 8 h at 20°C allowing it to be processed as a one-component resin in standard injection molding machines. (8 refs.)

77716 A recommended procedure for determining the strain rate sensitivity in superplasticity. T.G.Langdon, P.Yavari (Dept. of Materials Sci., Univ. of Southern California, Los Angeles, CA, USA). *Ser. Metall. (USA)*, vol.17, no.4, p.435-40 (April 1983). Reviews two procedures for the determination of the strain rate sensitivity m . The preferred procedure is by using a number of specimens, each tested at a different strain rate under conditions where there is negligible grain growth, and logarithmically plotting the steady-state stress, σ , versus the strain rate, $\dot{\epsilon}$. The strain rate cycling procedure, often employed in superplasticity, leads to an accurate and consistent value for m only if grain growth is negligible and the material exhibits a true steady-state condition. The individual datum points obtained from these procedures may be logarithmically plotted either as σ versus $\dot{\epsilon}$ or as $\dot{\epsilon}$ versus σ . For both types of plot, it is convenient to divide the results into linear portions to provide experimental values for m (or n) in the various regions of flow. (25 refs.)

77717 Tensile strength of hot-pressed $\text{ZrO}_2\text{-Y}_2\text{O}_3$ at high temperature. K.Matsusue, Y.Fujisawa, K.Takahara (Nat. Aerospace Lab., Chofu, Japan). *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.1, p.49-51 (1983). Uniaxial tensile strength tests of hot-pressed zirconia containing the metastable tetragonal phase were carried out at a temperature range from room temperature to 1600°C in air. The tensile strength rapidly decreased with increasing temperature, being at 500°C, 60% of that at room temperature, and above 1000°C was below 10%. (3 refs.)

- 77718 Cyclic grain boundary migration during high temperature fatigue. I. Microstructural observations. T.G.Langdon (Dept. of Materials Sci. & Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA), R.C.Gifkins. *Acta Metall. (USA)*, vol.31, no.6, p.927-38 (June 1983). Experiments were conducted on high purity lead at room temperature using reverse bending and torsion fatigue at low cyclic frequencies (≤ 1.50 Hz). Metallographic observations after testing show that there is a one-to-one correspondence between the markings from grain boundary migration and the number and pattern of cyclic loading, and this correspondence is maintained up to >100 cycles. Grain boundary sliding occurs in each cycle in addition to the migration, and this leads to the development of broad triple point folds. If the strain amplitude is maintained constant, it is shown that the average distance migrated in each cycle increases as the imposed frequency is decreased. The distance migrated is often exceptionally large in the first cycle of testing, and there is often a similar large initial displacement if the test is interrupted for periods of time from 1 to 24 h and then continued. For large grain sizes (≥ 2000 μm), the migration markings may lead to a zig-zag pattern where the individual segments lie fairly close to 45° to the stress axis. A model is described which accounts for the one-to-one correspondence and which is consistent with a fine structure observed within the migration markings. (36 refs.)
- 77719 Cyclic grain boundary migration during high temperature fatigue. II. Measurements of grain boundary sliding. T.G.Langdon (Dept. of Materials Sci. & Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA), D.Simpson, R.C.Gifkins. *Acta Metall. (USA)*, vol.31, no.6, p.939-36 (June 1983). For pt. I see *ibid.*, vol.31, p.927-38 (1983). Experiments were conducted to measure the extent of grain boundary sliding in high purity lead subjected to fatigue testing at room temperature. It is shown that the average sliding offset perpendicular to the surface, \bar{u} , increases rapidly during the initial ~ 25 cycles of testing, increases at a reduced rate thereafter, and ultimately stabilizes after ~ 300 cycles. The value of \bar{u} at any selected number of testing cycles decreases with decreasing strain amplitude at constant frequency but is independent of frequency at constant strain amplitude within the limited range of frequencies examined experimentally (0.17-0.50 Hz). The value of \bar{u} also increases with an increase in grain size at constant frequency and strain amplitude. In fatigue tests conducted at zero mean strain, there is an essentially equal contribution from positive and negative sliding offsets, so that the net displacement is zero. Slide hardening is not important in fatigue at low cycles in the presence of extensive grain boundary migration. The average rates of sliding in fatigue are comparable to the average sliding rates in the very early stages of creep. (31 refs.)
- 77720 Laws connecting viscous fracture with the flow limit. T.M.Golovinskiĭ, A.A.Kaminskiĭ. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.1, p.35-8 (1983). In Ukrainian. A pattern of yield-point-dependent changes in crack resistance was studied for a number of structural alloy steels from positions of fracture mechanics. It is shown that for high-strength unstable structural steels the dependence of fracture toughness K_{IC} on the yield point $\sigma_{0.2}$ is of a complex and nonuniversal nature. With instability lost, the steel $K_{IC} = f(\sigma_{0.2})$ dependence becomes an inversely proportional exponential. (8 refs.)

- 77721 Theoretical prediction of the cracking stress of three-dimensional randomly distributed steel fibre reinforced concrete. I.A.Pathan, M.A.Qureshi (Mehran Univ. of Engng. & Technol., Jamshoro, Pakistan). *Mehran Univ. Res. J. Eng. & Technol. (Pakistan)*, vol.1, no.3, p.17-27 (July 1982). [received: April 1983] A short method based on the crack arrest concept has previously been proposed for the prediction of the cracking stress of continuous wire reinforced concrete. The comparison of the theoretical and experimental results has demonstrated the validity of this method. In this paper the method is further extended to the case of the cracking stress of three dimensional randomly distributed steel fibre reinforced concrete. The effective spacing of short fibres is determined by considering their directional efficiency and length efficiency in restraining the crack propagation. The theoretical cracking stresses for various volume fractions of steel fibres are determined and compared with experimental results. (21 refs.)
- 77722 Polymer-filler interaction in polystyrene filled with coated glass spheres. I. Interfacial adhesion control. G.F.Abate, D.Heikens (Eindhoven Univ. of Technol., Lab. of Polymer Technol., Eindhoven, Netherlands). *Polym. Commun. (GB)*, vol.24, no.5, p.137-40 (May 1983). In gaining a better understanding of some aspects of the mechanism by which fillers may reinforce polymers, a system containing glass spheres in a polystyrene matrix with adhesive interlayers of varying strength was realized. The strength increase is achieved by compatibilization arising from interaction between the interlayer bound to the filler and the matrix. The results are shown by scanning electron microscopy, SEM. (17 refs.)
- 77723 Helium embrittlement of iron-chromium alloys. K.Suganuma (Inst. of Sci. & Industrial Res., Osaka Univ., Suita, Japan), H.Sakairi, H.Kayano. *Radiat. Eff. Lett. Sect. (GB)*, vol.76, no.3, p.83-5 (1983). The helium embrittlement of Fe-(0-15)wt.%Cr alloys was examined with high temperature tensile testing. Helium injection was performed partly by using a cyclotron and partly by thermal neutron irradiation with boron alloying. The helium embrittlement was more severe in lower chromium alloys. Helium bubbles were observed in Fe but not in Fe-15Cr, both of which contained 24 atppm helium tested at 1023K. (6 refs.)
- 77724 Investigation of structural changes during fracture of $\gamma + \epsilon$ steel. G.N.Belozerskiĭ, V.N.Gittsovich, E.M.Sosenushkin, O.G.Sokolov, A.S.Chekashova (A.A. Zhdanov State Univ., Leningrad, USSR). *Fiz. Met. & Metallogr. (USSR)*, vol.55, no.4, p.788-91 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* The nuclear gamma resonance (Mossbauer) method was used in the backscattering geometry to study structural changes occurring in $\gamma + \epsilon$ steels as a result of fracture. The phase composition of a steel was determined directly on a fracture surface and it was established that the fracture occurred in zones whose structure was very different from the original one. It was found that the fracture was preceded by the formation of the gamma phase and the amount of the latter in the zone where defects were concentrated amounted to 90% and was determined by the loading conditions. (6 refs.) A.T.
- 77725 Electron magnetic spectrometer investigation of fracture surfaces formed in vacuum and in air. V.G.Bragin, I.N.Shabanova, O.A.Kulyabina, V.A.Trapeznikov (Inst. of Metal Phys., Acad. of Sci., Izhevsk, USSR). *Fiz. Met. & Metallogr. (USSR)*, vol.55, no.4, p.829-32 (April 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* X-ray electron spectroscopy was used to study fracture surfaces obtained in vacuum and in air for samples of the same steel 37KhN3A. A comparison of the data obtained in vacuum and in air indicated that the results of a quantitative analysis were in good agreement in respect of the segregating element (phosphorus), but in the case of fracture surfaces formed in air the information on oxygen segregation was lost. (10 refs.) A.T.
- 77726 Effect of two-phase solidification on fracture toughness of aluminum alloys. N.K.Das, R.K.Mahanti, C.S.Sivaramakrishnan, R.Kumar (Nat. Metall. Lab., Jamshedpur, India). *Indian J. Technol.*, vol.20, no.11, p.434-7 (Nov. 1982). [received: May 1983] It is concluded that fracture toughness (K_{IC}) of high strength Al-Cu and Al-Zn-Mg containing Li and a dispersion of graphite particles is influenced by solidification and grain size. Whilst solidification from the two-phase region (TPS) improved K_{IC} , grain size up to a certain level lowered K_{IC} and thereafter improved it. (9 refs.)
- 77727 Welding of polymers of nonuniform molecular weight. S.Prager (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA), D.Adolf, M.Tirrell. *J. Chem. Phys. (USA)*, vol.78, no.11, p.7015-16 (1 June 1983). The chain dynamics responsible for the welding or healing process which occurs when two pieces of the same polymer are brought together have recently received considerable attention, motivated by the publication of reliable experimental results on crack healer. The authors have extended the treatment of their previous paper (*ibid.*, vol.75, p.5194, 1981) to allow for polydispersity. A potential complication introduced by polydispersity is the possible segregation of low molecular weight species at the annealed surfaces of the polymer samples before contact. The authors therefore assume the bulk composition of the polymer to extend right up to the junction surface and concern themselves only with the consequences of configurational relaxation. (7 refs.)
- 77728 Life time calculations for LCF loading combined with tensional hold periods. Applications to Zircaloy-4 and AISI 304. M.Bocek, A.Armas, D.Piel (Inst. fur Material- und Festkörperforschung, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.159-68 (April 1983). The life time in high amplitude strain cycling with tensional hold periods is analysed presuming that creep failure damage is life determining. The life fraction rule (LFR) is used to calculate the life time consumed during the dwell period in strain controlled tests as well as during tensional hold time stress cycles. It follows that stress relaxation occurring during the strain hold periods plays the dominant influence upon the relationship between life and dwell time. For strong stress relaxation (e.g. high temperature) less damage is accumulated as compared to suppressed relaxation (low temperature). The damage in stress relaxation is calculated by means of the LFR and the results are compared to experiments conducted on Zircaloy-4 and the austenitic stainless steel Type AISI 304. (20 refs.)
- 77729 The effect of radiation and cryogenic temperature on the fatigue resistance of G-11 CR glass-cloth/epoxy laminates. B.Korukonda, J.C.Conway, Jr., R.A.Queney (Pennsylvania State Univ., University Park, PA, USA), W.S.Diehorn. *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.197-202 (April 1983). Tension-tension fatigue tests were performed on unirradiated and irradiated G-11 CR notched fatigue specimens at 295 and 77K. Fatigue failure was based on the initiation and propagation of fatigue cracks from the notch roots to a selected length. Results indicate an increase in fatigue resistance at

cryogenic temperature, a moderate radiation effect at both test temperatures and substantially different failure modes at 295 and 77K. (5 refs.)

77730 Effects of sodium and lithium environments on mechanical properties of ferrous alloys. O.K.Chopra (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).

J. Nucl. Mater. (Netherlands), vol.115, no.2-3, p.223-38 (April 1983).

A review of the current status of work on the mechanical properties of structural materials in liquid sodium and lithium environments is presented. The influence of the environment as well as the effects of the microstructural and compositional changes that occur in austenitic and ferritic steels during long-term exposure are discussed. Requirements for additional data on mechanical properties are identified. (44 refs.)

77731 Determination of threshold stress intensity for crack growth at high temperature in silicon carbide ceramics. E.J.Minford, R.E.Tressler (Dept. of Materials Sci. & Engng., Pennsylvania State Univ., University Park, PA, USA).

J. Am. Ceram. Soc. (USA), vol.66, no.5, p.338-40 (May 1983).

A method for estimating the threshold stress intensity for crack growth is presented. The technique requires prior knowledge of the flaw population of a material and uses applied static loads followed by a fast fracture to assess the effect of initial applied stress intensity on flaw behaviour. The technique was applied to a hot-pressed SiC at 1200° and 1400°C in a non-oxidizing atmosphere. At 1400°C with a static load time of 4 h, the threshold stress intensity was determined to be $\approx 1.75 \text{ MPa}\cdot\text{m}^{1/2}$ with a slight tendency toward higher fracture stress with increasing initial stress intensity below the threshold. At 1200°C for a static load time of 4 h, apparent strengthening was observed below a threshold stress intensity of $\approx 2.25 \text{ MPa}\cdot\text{m}^{1/2}$. This strengthening effect appears to result from stress relaxation in the crack-tip region, probably by plastic deformation which involves the oxide grain-boundary phase. (8 refs.)

77732 Influence of thermal decomposition on the mechanical properties of magnesia-stabilized cubic zirconia. M.V.Swain, R.C.Garvie, R.H.J.Hannink (CSIRO Div. of Materials Sci., Advanced Materials Lab., Melbourne, Victoria, Australia).

J. Am. Ceram. Soc. (USA), vol.66, no.5, p.358-62 (May 1983).

Cubic magnesia-stabilized zirconia was decomposed by isothermal heat treatment at 1100°C. The mechanical properties, including strength, fracture toughness, and hardness, were measured at various stages during the decomposition process. The strength initially decreased with aging but then recovered almost to its initial value. This strength decrease was associated with cracking of islands of the cubic phase in the matrix of monoclinic zirconia. The fracture toughness followed the strength although it was found that the monoclinic phase exhibited stable crack growth during notched beam fracture experiments or R-curve behavior. Measurements of the hardness indicated that the cubic phase was much harder than the monoclinic phase. In addition, X-ray diffraction, optical, and transmission electron microscopy studies were made of the decomposition process. (24 refs.)

77733 Fracture toughness of unidirectional glass/carbon hybrid composites. H.T.Thorat, S.C.Lakkad (Dept. of Aeronautical Engng., Indian Inst. of Technol., Bombay, India).

J. Compos. Mater. (USA), vol.17, no.1, p.1-14 (Jan. 1983). [received: June 1983]

The results of fracture toughness of the glass/carbon fibre reinforced epoxy hybrid composites, as expressed by K_{IC} and G_{IC} —the critical stress intensity factor and the critical strain energy release rate respectively, in the crack opening mode—are presented. The tests have been conducted in the 3-point bending configuration for the specimens having a total reinforcement content of about 55%. The K_{IC} has been evaluated from the G_{IC} and also from the standard expressions normally used for isotropic materials. Similarly, the G_{IC} and K_{IC} have been evaluated by using both P_{max} , the maximum load, and P_0 , the point of intersection on the load displacement curve with a line having 5% less slope than the slope of the curve at the origin. The trend of the results obtained by these two methods is considerably different particularly with increasing glass content in the hybrids. (14 refs.)

77734 Enhancement of strength in composites reinforced with previously stressed fibers. P.W.Manders, T.-W.Chou (Dept. of Mech. & Aerospace Engng., Univ. of Delaware, Newark, DE, USA).

J. Compos. Mater. (USA), vol.17, no.1, p.26-44 (Jan. 1983). [received: June 1983]

Failure of a fiber in an aligned composite causes a stress wave to propagate outwards placing a dynamic overstress on the neighboring fibers. This is generally greater than the static stress concentration factor which prevails after the system has settled, and increases the probability that adjacent fibers also fail, weakening the composite. This analysis shows how weak fibers may be pre-fractured to eliminate the dynamic overstress thereby increasing the strength of the composite. This strength enhancement is discussed with reference to the level of pre-stress, fiber variability, stress concentration factors, and size of the composite. (13 refs.)

77735 Distributions of fatigue life and fatigue strength in notched specimens of a carbon eight-harness-satin laminate. T.Shimokawa, Y.Hamaguchi (Second Airframe Div., Nat. Aerospace Lab., Tokyo, Japan).

J. Compos. Mater. (USA), vol.17, no.1, p.64-76 (Jan. 1983). [received: June 1983]

Investigates the distribution properties of fatigue life and fatigue strength in sharply notched specimens of a carbon fabric laminate, which was made of three layers of eight-harness-satin/epoxy prepreg sheets. Fatigue life distributions were obtained at six stress levels by carefully designed fatigue tests of four point plane bending under a constant temperature and humidity condition. Sample sizes were 30 for the three high stress levels and 12 for the three low stress levels. The amount of scatter and distributional form of fatigue life and fatigue strength are discussed from the test results. It is found that fatigue strength distributions are practically normal and their standard deviations are constant regardless of fatigue life. (9 refs.)

77736 Thermal stability in microstructure and rupture strength of directionally solidified Ni-Al-Ti eutectic alloys. Rong Wu Zhang (Inst. of Aeronaut. Materials, Beijing, China), J.Echigoya, H.Suto.

J. Jpn. Inst. Met. (Japan), vol.47, no.5, p.432-8 (1983). In Japanese.

Thermal stability in microstructure as well as static and creep rupture strengths of directionally solidified Ni-Al-Ti eutectic alloys for high temperature use were investigated; the dislocation substructure in ruptured specimens was observed by means of transmission electron microscopy. The oriented structure of γ and γ' phases, so-called 'DS' structure was fairly stable in the temperature range below 1273K, but it was disintegrated at higher temperatures. The more the γ content was, the more stable the DS structure was. DS structure was disintegrated rapidly by thermal cycling. Static tensile strength showed a maximum value at temperatures ranging between 973K and 1173K, and decreased rapidly at higher temperatures. γ fibres were broken by tension at temperatures below 1173K, but they were elongated with matrix at 1373K. DS structure disintegrated during creep at higher temperatures than 1273K.

It was considered from the above-mentioned results that the temperature range for use of these alloys was limited below 1273K, but the rupture strength of the present alloy (L:80.Sat.%Ni-1.0at.%Al-8.Sat.%Ti) was superior to that of a Jackson's alloy. Characteristic dislocation substructures in specimens subjected to creep were observed. (18 refs.)

77737 Effects of thickness and compressive residual stress of boronized layer on bending fatigue strength properties of boronized steels. T.Endoh, M.Kawakami (Dept. of Metall. Engng., Tokai Univ., Tokyo, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.251-7 (March 1983). In Japanese.

Plane and rotating bending fatigue tests of boronized steels with various thickness of boronized layers were conducted. The effects of thickness and compressive residual stress of the boronized layer on the fatigue strength were investigated. Furthermore, the X-ray method was successfully applied to measure the changes in residual stress and half-value breadth during plane bending fatigue. Fatigue crack initiation occurred both in the boronized surface layer and at the boundary between the boronized layer and the matrix. The surface compressive residual stress hardly changed during fatigue, but the half-value breadth increased. The compressive residual stress is effective for increasing the fatigue strength when crack initiation occurs at the surface. (8 refs.)

77738 X-ray fractography on fatigue fractured surface. Y.Sekita (Mitsubishi Heavy Industries Ltd., Sagami-hara, Japan), S.Kodama, H.Misawa.

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.258-63 (March 1983). In Japanese.

As a basic study of X-ray fractography, the relation between the residual stress on the fatigue fractured surface and some parameters of the fracture mechanics were investigated. The materials used were Ni-Cr-Mo-steel, 0.5%C steel and high strength steel (UTS>588 MPa). The test pieces were CT-specimens with $W=51 \text{ mm}$ and $B=12 \text{ mm}$. The fatigue tests were carried out under constant load and constant range of stress intensity factor. On the fatigue fractured surface the residual stress along the crack propagation direction, was measured by a parallel beam X-ray stress measurement system, and the half value breadths of the diffraction profile were also measured. In the linear crack propagation stage of conventional constant load fatigue tests the residual stress on the fracture surface increased at first, and then decreased with increasing ΔK after about $\Delta K=30 \text{ MPa}\cdot\text{m}^{1/2}$. For Ni-Cr-Mo-steel and 0.5%C steel, the residual stress could be expressed as a function of ΔK and was affected only slightly by the stress ratio. (4 refs.)

77739 X-ray fractographic study on fatigue fracture surface of SM50A steel. K.Ogura, Y.Miyoshi (Faculty of Engng. Sci., Osaka Univ., Toyonaka, Japan), M.Kayama, M.Tsuiji.

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.264-70 (March 1983). In Japanese.

The residual stress and breadth of the diffraction intensity curve were measured at and beneath the fracture surface. The analysis of residual stress on the fatigue fracture surface was also conducted by using the finite element method. A emphasis was made on finding the correlation between the residual stress or the plastic zone size determined from the X-ray measurements and the applied stress intensity factor. Both the distribution of residual stress and half-value breadth were found to be useful for the prediction of monotonic plastic zone size or K_{max} , although it still remained in question for the possibility of estimating cyclic plastic zone size. The correlation between the surface values of residual stress and the applied stress intensity factor was not clear. The effect of fatigue crack closure on the residual stress of the fracture surface was found to be relatively small and limited to the very thin layer near the fracture surface. (15 refs.)

77740 Effect of specimen size and configuration of fatigue crack growth behavior of mild steel butt welded joints. Y.Kitsunai (Res. Inst. of Industrial Safety, Kyose, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.304-9 (March 1983). In Japanese.

A study was made to determine the effects of specimen size, configuration and crack orientation to the weld axis on the fatigue crack growth rate of mild steel butt welded joints. Two types of welded specimens, the compact type (CT) specimens with three different sizes and the center-cracked-tension (CCT) specimens were used. Residual stress distributions in CT specimens were examined by means of the strain gauge method. In the case of welded specimens, the fatigue crack growth rates of CT specimens having widths of 100 and 260 mm were roughly the same regardless of crack orientations to the weld axis, while the crack growth rates in specimens with width less than 100 mm were faster than those of the larger width specimens. In the case of base metal specimens, the specimen size had no appreciable effect on crack growth rates. The crack growth rates of welded CT specimens were markedly reduced as compared with those of CCT specimens. (16 refs.)

77741 Impact fracture mechanisms in polymer blends: rubber-toughened nylon. Souheng Wu (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.5, p.699-716 (May 1983).

The impact fracture mechanisms of rubber-toughened nylon are analyzed by measuring the energy dissipated in several different processes during notched fracture. An energy balance is thus established for the impact fracture. The stress-whitened zone is shown to be the energy dissipation zone, having an energy dissipation density of 5.30 cal/g . About 25% (i.e. 1.44 cal/g) of the impact energy is dissipated by matrix crazing. About 75% (i.e. 3.86 cal/g) is dissipated as heat by matrix yielding, causing a temperature rise of 9.1°C in the energy dissipation zone. Surface energy storage on the fracture surfaces is negligible (i.e. $1.45 \times 10^{-5} \text{ cal/g}$). During matrix yielding, about 12% of α -tricalcic nylon crystals is transformed into pseudohexagonal crystals. (29 refs.)

77742 The ductile fracture of metals: a microstructural viewpoint. H.G.F.Wilsdorf (Dept. of Materials Sci., Univ. of Virginia, Charlottesville, VA, USA).

Mater. Sci. & Eng. (Switzerland), vol.59, no.1, p.1-39 (May 1983).

A review of the literature on the ductile fracture of metals and alloys reveals almost immediately that the majority of investigations approach the topic from a fracture mechanics point of view and that papers based entirely on microstructural research are rare. Some aspects of continuum theory and the atomic approach to fracture are discussed. The microstructural regime covers the broad area between these two concepts. Since ductile fracture depends on the history of plastic deformation in the specimen, an outline of a successful theory of work hardening has been included. The experimental tools for microstructural investigations are briefly reviewed. Rupture is discussed. The most common mode, fibrous fracture, is reviewed. A variety of topics which have a bearing on a more comprehensive understanding of ductile fracture (such a delamination and cleavage fractures, the role of voids in microcrack initiation, the energy of dislocation cell walls, and the thickness of microtensile specimens and the rate of straining in situ experiments) are emphasized and discussed critically. (166 refs.)

- 77743 The mechanical properties and tensile fracture characteristics of partially annealed low carbon mild steel sheet.** M.S.Devgun, A.J.Carrillo, T.A.Roosen (Dept. de Mecanica, Univ. Simon Bolivar, Caracas, Venezuela). *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.49-57 (May 1983). The tensile mechanical properties and static fracture characteristics of partially annealed low carbon mild steel are reported. Partially annealed samples were prepared by annealing the previously cold-rolled (0%, 28% and 50% cold reduction) steel sheet at 610°C in a salt bath for 0, 60 and 300 s. These samples were subjected to tensile tests to determine their mechanical properties and the Charpy impact tests and Kahn-type tear tests to measure their tensile fracture properties. It was concluded that the crack initiation and crack propagation energies are linearly related to the corresponding tensile mechanical properties. Furthermore, a transition in the behaviour of partially annealed steel occurs at an energy level of 40 J and at the following mechanical properties: ultimate tensile strength, 6.2×10^2 MPa; yield stress, 6.1×10^2 MPa; Charpy impact energy, 2.5×10^3 J m⁻²; total elongation, 12%. Below this point the material is more resistant to crack propagation than to crack initiation. (23 refs.)
- 77744 Low cycle fatigue of aluminum at elevated temperatures.** J.C.Tsou, D.J.Quesnel (Mech. Engrg. Dept., Univ. of Rochester, Rochester, NY, USA). *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.99-113 (May 1983). High temperature low cycle fatigue data are reported for polycrystalline aluminum of 99.988% purity. Experiments were carried out at a constant strain rate over a range of temperatures from ambient temperature to 400°C. Strain rate change tests were employed to determine the rate-sensitive behavior. Cyclic hardening curves and saturated hysteresis loops undergo a gradual transition in their characteristic shapes with increasing temperature, suggesting a change in the mechanisms controlling deformation. These changes in behavior are not reflected in the cyclic stress-strain curve which shows a gradual decrease in work-hardening rate with increasing temperature. The temperature dependence of the cyclic saturation stress appears to be linear but does not exhibit a region of rapid stress drop. The discussion focuses on the role of vacancies in determining the high temperature deformation behavior of a cellular microstructure. (37 refs.)
- 77745 The influence of the static I load and R ratio on mode III fatigue crack growth behaviour in mild steel.** E.K.Tschegg (Inst. of Appl. & Tech. Phys., Tech. Univ. Vienna, Vienna, Austria). *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.127-37 (May 1983). The influence of a superimposed static mode I load and of different mode III mean torques on mode III fatigue crack growth (antiplane shear mode) in cylindrical circumferentially notched AISI C1018 steel specimens has been studied. Increasing the static mode I crack opening by an axial load reduces the sliding crack closure influence (friction, abrasion and mutual support between the fracture surfaces). At high torsional stress levels it is possible to suppress the sliding crack closure almost completely in specimens with shallow cracks by applying an axial load; this is not the case for low torsional stresses. The crack growth rate may be correlated with an effective stress level from which the crack closure effect has been subtracted; this value is found by an extrapolation procedure. The crack growth rate is not influenced by small axial loads (a resulting K_I value of 0.3 MPa m^{1/2}). However, if the axial load K_I is increased to 4.9 MPa m^{1/2}, the mode III crack growth rate increases. (16 refs.)
- 77746 Intergranular creep embrittlement by non-soluble impurity: Pb in precipitation hardened Al-Mg-Si alloys.** M.Guttman, B.Quantin, P.Dumoulin (Centre des Matériaux, Ecole des Mines, Evry, France). *Met. Sci. (GB)*, vol.17, no.3, p.123-40 (March 1983). Minute amounts of Pb induce intergranular embrittlement of precipitation hardened Al-Mg-Si alloys in creep conditions but not in tension and toughness tests. Auger and Rutherford backscattering analyses of impact-fracture surfaces revealed the presence of submonolayer Pb coverages which were first attributed to a segregation of Pb to grain boundaries. However, in view of the contradictions which arose from the two types of results, further experiments using scanning Auger and X-ray microanalysis revealed that in fact Pb was essentially in precipitated form, its solubility being much smaller than expected, and that it spread on the surface by diffusion immediately after fracture. The preferential association between Pb globules and large AlFeSi inclusions favours this process since the latter particles initiate transgranular dimples. The surface analysis results are discussed on the basis of a semi-quantitative description of the possible distribution of globules on fracture surfaces. The surface diffusion process and the Pb-(AlFeSi) association are also responsible for the mechanism of embrittlement of Pb in creep conditions. (41 refs.)
- 77747 Effect of prior deformation on the cleavage of zinc single crystals.** C.Messmer (Harris Semiconductor, Melbourne, FL, USA), D.Dew-Hughes, J.C.Biello. *Philos. Mag. A (GB)*, vol.47, no.5, p.635-56 (May 1983). The critical stress intensity factor, K_{Ic} , for basal cleavage at 77K has been measured on a number of zinc single crystals, either as-grown or pre-deformed by tension or by torsional fatigue. The dislocation distribution and the extent of the plastic zone associated with cleavage were studied by chemical etching and by X-ray topography. K_{Ic} is found to decrease with prior deformations, and with increasing density of non-basal 'forest' dislocations. This result is consistent with the forest dislocations limiting the extent of plastic deformation which accompanies cleavage, even at 77K. This is confirmed by the X-ray topography studies of plastic zone size. However, effective fracture surface energies are found to be considerably less than the thermodynamic surface energy for the basal plane of zinc. (23 refs.)
- 77748 Fractography of polyethylene glycol dimethacrylate doped with polymethyl methacrylate.** M.Atsuta, D.T.Turner (Dental Res. Center, Univ. of North Carolina, Chapel Hill, NC, USA). *Polym. Eng. & Sci. (USA)*, vol.22, no.18, p.1199-204 (Dec. 1982). The presence of polymethyl methacrylate (PMMA) can greatly affect the properties of materials made by polymerization of ethylene glycol dimethacrylate (EGDM). Fracture surfaces, examined by scanning electron microscopy, show a much wider range of morphologies in mist regions than observed in previous work on PEGDM alone. These morphologies are attributed to the modernization of brittle fracture by localized plastic deformation. It is suggested that the effect of PMMA is due to its segregation around clusters of highly cross-linked particles of PEGDM that, as a result, become more discrete and, hence, more susceptible to interparticle displacements during fracture. In agreement with this suggestion, the mist regions usually exhibit a particulate microstructure. (17 refs.)
- 77749 Strain localization and hydrogen embrittlement.** M.R.Louthan, Jr. (Dept. of Materials Engrg., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). *Scr. Metall. (USA)*, vol.17, no.4, p.451-4 (April 1983). Irreversible thermodynamic considerations and the observation of dislocation transport of hydrogen during plastic deformation provide a justification for hydrogen enhanced strain localization in metals and alloys. This justification

is based on the symmetry of the Onsager coefficients and the fact that entropy production is positive during plastic deformation. This justification therefore provides support for the argument that one mechanism of hydrogen embrittlement is hydrogen enhanced strain localization. (18 refs.)

- 77750 Ion implantation effect on fatigue crack initiation in Ti-24V.** K.V.Jata, J.Han (Fracture & Fatigue Res. Lab., Georgia Inst. of Technol., Atlanta, GA, USA), E.A.Starke, Jr., K.O.Legg. *Scr. Metall. (USA)*, vol.17, no.4, p.479-83 (April 1983). The results of a study of aluminum implanted Ti-24V (β -Ti alloy) are reported. It was found that implantation slightly improves the fatigue life in plastic strain controlled tests. The maximum improvement is observed to be about 40% at a plastic strain amplitude of 1.5×10^{-3} . The replica study in plastic strain controlled tests suggests that the surface deformation in the non-implanted Ti-24V occurs in coarse slip bands, while in the implanted Ti-24V slip is accommodated in more than one slip plane and the slip lines remain finer (as compared to the non-implanted condition) with continued cycling. The replica study also indicates that the fatigue crack initiation occurs on the surface, at slip bands for non-implanted samples and at grain boundaries for implanted samples. A considerable improvement in high cycle fatigue life is observed with aluminum implantation. The improvement is approximately two orders of magnitude at a stress level corresponding to 50% of the yield stress. This improvement is mainly due to the compressive residual stresses arising from aluminum implantation. (5 refs.)
- 77751 Effect of multiple crack propagation on the high temperature low cycle fatigue of a cast nickel-base alloy.** M.Y.Nazmy (Brown Boveri Res. Center, Baden, Switzerland). *Scr. Metall. (USA)*, vol.17, no.4, p.491-4 (April 1983). A preliminary investigation was carried out to study the effect of multiple crack propagation on the high temperature low cycle fatigue life (HTLCF) behaviour of IN 738 superalloy. The longer HTLCF lives of specimens tested under cycles with hold time compared to that of specimens tested under continuous cycling were explained on the basis of the effect of multiple cracks on crack growth rate. A multiple notched specimen, used as a model to clarify this effect, showed a longer life than the normal smooth specimens tested under the cycles with hold times. (16 refs.)
- 77752 The effect of pre-existing epsilon martensite on the hydrogen induced fracture of austenitic stainless steel.** S.-P.Hannula (Dept. of Mining & Metall., Helsinki Univ. of Technol., Espoo, Finland). *Scr. Metall. (USA)*, vol.17, no.4, p.509-13 (April 1983). Demonstrates the effect of pre-existing ϵ -martensite on hydrogen induced fracture by using a technique where deformation-induced phases are first revealed in a controlled dissolution sequence. It was concluded that in a slightly deformed matrix hydrogen induced fracture propagates mainly along $\{111\}$ planes and primarily along the ϵ/γ -interface. In regions between the active slip planes, the fracture propagates in a steplike manner and only a part of these steps is on the $\{111\}$ -planes. (20 refs.)
- 77753 A brittle to ductile transition in NiAl of a critical grain size.** E.M.Schulson, D.R.Barker (Thayer School of Engrg., Dartmouth Coll., Hanover, NH, USA). *Scr. Metall. (USA)*, vol.17, no.4, p.519-22 (April 1983). Tensile experiments have been carried out on the strongly ordered B2 aluminate, NiAl. It was established that the ductility is very low and essentially independent of grain size for aggregates of grains larger than about 20 μ m; for finer-grained aggregates the ductility increases sharply with decreasing grain size. NiAl thus exhibits a critical grain size below which polycrystalline aggregates are ductile in tension. The yield strength obeys the Hall-Petch equation $\sigma_y = \sigma_0 + k_y d^{-1/2}$ where $\sigma_0 = 152$ MPa and $k_y = 0.16$ MPa m^{1/2} under the conditions noted. For all grain sizes, fracture occurs in a brittle manner through a combination of intergranular decohesion and transgranular cleavage. (9 refs.)
- 77754 High-temperature transgranular fracture in an austenitic stainless steel.** T.Hasegawa, B.Ilschner (Inst. fur Werkstoffwissenschaften I, Univ. Erlangen-Nurnberg, Erlangen, Germany). *Scr. Metall. (USA)*, vol.17, no.4, p.523-7 (April 1983). Attempts to clarify the cause of transgranular fracture in Incoloy 800 H, an austenitic stainless steel. It is concluded that cold-rolling, a common manufacturing process to form Incoloy 800 H into a final sheet product, tends to break hard second-phase particles (probably Ti(C,N)) present randomly in this alloy. The fissures introduced into the particles may act as nuclei for the formation of internal microcracks during high-temperature straining and, thus, may cause accelerated creep rupture in a transgranular mode. (7 refs.)
- 77755 Crack resistance of pearlitic eutectoid steels. I. Fracture of steels in short-term loading.** O.N.Romaniv, E.A.Shur, A.N.Tkach, T.N.Kiseleva, V.N.Simin'kovich (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.325-31 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.42-8 (July-Aug. 1982). [received: May 1983]. An investigation is made of the influence of the form and size of the cementite particles and also of the effective austenitic grain size on the resistance to brittle fracture of eutectoid steels with a structure of lamellar and granular pearlite. (17 refs.)
- 77756 Influence of vacuum and low temperature on fatigue crack growth rate in magnesium alloy sheets.** N.M.Grinberg, V.A.Serdyuk, T.I.Malinkina, A.S.Kamyshkov (Physicotech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.331-6 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.48-54 (July-Aug. 1982). [received: May 1983]. An investigation was made of the growth rate of through and blind fatigue cracks in magnesium alloys differing in composition and heat treatment in a wide range of change in stress intensity factor in vacuum and at low temperature. A reduction in temperature influences the fatigue crack growth rate ambiguously. With low values of K_{max} it decreases at low temperature in comparison with the crack rate at room temperature in all of the alloys. With high values of K_{max} crack growth may either become slower or intensify depending upon the composition of the alloys and their structural condition. With a decrease in temperature the level of K_{th} increases, while the value of K_{Ic} is predetermined by the microstructure of the alloys. The fracture micromechanisms and their change under the influence of the medium and temperature correlate with the macroscopic parameters of fatigue crack growth. (8 refs.)

77757 Cyclic strength of magnesium-base reinforced composites. D.M.Karpinos, A.I.Gordienko, V.K.Samarin, V.Kh.Kadyrov, A.F.Voitenko (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.10, p.810-12 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.66-70 (Oct. 1982). [received: May 1983]

The results of an investigation into the cyclic strength of composite materials (CMs) based on magnesium reinforced with boron and steel fibers show that such CMs possess good resistance to fatigue fracture. High-strength fibers in a ductile matrix act as barriers on the path of propagation of a crack during cyclic loading, as a result of which a material of high fatigue strength is obtained. Under these conditions, the ductile steel fibers, whose modulus is higher than that of the matrix material, inhibit the propagation of a crack. A crack meeting a fiber may cease to grow, and subsequent fracture of such a magnesium-base CM will occur through the formation of new fatigue cracks in the matrix. In materials with the brittle boron fibers fatigue cracks may form and propagate both in the fibers (because of the statistical character of their strength) and directly in the matrix. The propagation of a main fatigue crack may be impeded by the fiber/matrix interfaces. Discontinuities at an interface result in local blunting of the crack, which lowers the stress concentration at its tip and arrests its growth. The method described for investigating the cyclic strength of magnesium-base CMs, in which allowance is made for changes in rigidity experienced in the course of cyclic deformation, is suitable also for studying the fatigue of CMs with other matrices. (7 refs.)

77758 Microstructure and mechanical strength of aluminum titanate ceramic prepared from mixture of alumina and titania. K.Hamano, Y.Ohya, Z.Nakagawa (Res. Lab. of Engng. Materials, Tokyo Inst. of Technol., Yokohama-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.2, p.94-101 (1983). In Japanese. To improve mechanical strength of aluminum titanate ceramic, relations between microstructure and mechanical strength of the fired specimens were investigated. Specimens were prepared from stoichiometric mixtures of calcined aluminum hydroxide at 700°-1200°C for 2 h or fine corundum and anatase or rutile. During heating, alumina and titania of all specimens were converted into corundum and rutile, and aluminum titanate formation started from then at about 1300°C and completed at 1450°C. The specimens were fired at 1350°C, 1400°C, 1450°C and 1500°C each for 4 h. The density of any specimen was less than 80% of the theoretical density, and showed minimum for the specimens fired at 1400°C, which caused by volume expansion accompanied with formation of aluminum titanate from alumina and rutile. Size of aluminum titanate grains of fired bodies was 3-4 µm. Many grains agglomerated each other and formed large aggregates of 100-200 µm. Under the crossed nicols figure of polarization microscope, each aluminum titanate grain in one large aggregate showed simultaneous extinction, which means that the aluminum titanate grains in each aggregate oriented strongly. (11 refs.)

77759 Prediction of intergranular failure in Ni-Cr based alloys in low cycle fatigue at high temperatures - UK16. M.F.Day, G.B.Thomas. Report NPL-DMA(A)62, Nat. Phys. Lab., Teddington, England (1983), 55 pp. The fractional life approach was successful in correlating the results of LCF tests using a wide range of cyclic conditions. Metallographic measurements of fracture damage in IN597 generally supported the assumptions implicit in the fractional life approach. Failure mechanisms in both IN597 and IN738 LC were generally consistent with assumptions made to modify and extend the applicability of the fractional life approach. Strain range partitioning could not be successfully applied to either material. In the case of IN597 a marked stress dependence of the CP lifetime relationship has been found. For IN738 LC several negative values were obtained for CP, PC and CC lifetimes. When the compression part of a cycle with a tensile dwell period was carried out at a lower temperature the intergranular damage in specimens of IN597 was increased and life was reduced compared with an isothermal test in otherwise similar conditions. (14 refs.)

77760 Mechanical properties of $(\text{Fe}_{100-x}\text{M}_x\text{B}_{17})$ metallic glasses. G.Hunger, B.L.Mordike (Inst. für Werkstoffkunde und Werkstofftech., Tech. Univ. Clausthal, Clausthal, Germany).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.277-81. The mechanical properties hardness, tensile strength and fracture toughness of $(\text{Fe}_{100-x}\text{M}_x\text{B}_{17})$ glasses were measured for different alloying contents and heat treatments. If the as-quenched state the hardness is influenced mainly by changes in the metal-metalloid bonding. The fracture toughness is dependent on the alloying elements as well as the actual state of the glass. Heat treatment of the glass thus hardly influences the hardness whereas the toughness decreases strongly and significant changes in the fracture surface occur. Calorimetric observations suggest that structural relaxation is the primary reason for this behaviour although some effect of annealing out of internal stresses must be present. (16 refs.)

77761 Deformation induced dilatations and new observations on fracture in compression in metallic glasses at low temperatures. J.Megusar, A.S.Argon, N.J.Grant (MIT, Cambridge, MA, USA). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.283-7. Deformation induced dilatations were measured on a Pd-Cu-Si glass by a differential dilatometric method during crystallization. At large pre-strains, these dilatations are large and of the order of 20%. Fracture surfaces of specimens in compression show either the characteristic features of tensile separation or evidence for repeated nucleation of fracture. Rubbing was observed only in a small fraction of a fracture surface. (9 refs.)

77762 The effect of hydrogen on an iron based amorphous alloy. H.Shahani, H.Soderhjelm (Dept. of Casting of Metals, Royal Inst. of Technol., Stockholm, Sweden).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.289-93. Systematically studies the brittleness and the atomic structure in an Fe(SiBC) alloy. Different amounts of hydrogen have been dissolved in the alloy. It has then been studied at different cooling rates. Hydrogen gas of different partial pressures was dissolved into the melt. The alloy was then rapidly quenched by a chill block melt spinning method. The cooling rates were changed by changing the velocity on the chilling roll. The brittleness and the atomic structure were examined by bending tests and X-ray diffraction. X-ray diffraction showed that the ribbons were amorphous when the cooling rate was sufficient. Amorphous ribbons without any hydrogen were ductile, crystalline ribbons of this alloy were brittle. The ribbons with dissolved hydrogen and amorphous structure were brittle even at small amounts of hydrogen. At the highest cooling rates the ribbons with low hydrogen content were ductile. There seems to be a connection between the hydrogen content and the amorphous ribbons

ductility. The hydrogen content only has a slight influence to amorphous structure. (7 refs.)

77763 Environmental cracking of amorphous alloys. S.Ashok, T.P.Slavin, N.S.Stoloff, M.E.Glicksman (Rensselaer Polytech. Inst., Troy, NY, USA). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.309-13. Six amorphous metals have been tested in liquid metal environments or while charging with hydrogen. Differences in sensitivity to each environment are correlated with fractographic features. Evidence in support of enhanced shear as the mechanism of environmental cracking is presented. (6 refs.)

77764 Mechanisms of material removal during erosion of a stainless steel. S.Soderberg, S.Hogmark, H.Swahn (Uppsala Univ. Inst. of Technol., Uppsala, Sweden).

ASLE Trans. (USA), vol.26, no.2, p.161-72 (April 1983). Solid particle erosion of an austenitic stainless steel was studied utilizing various metallographic techniques. Examination of single impacts on a polished surface resulted in a semiquantitative crater classification. It was, however, found that material removal generally involves the interactive effect of several cumulative impacts. Consequently, topography and internal structure of the target surface layer after multiple impacts was investigated. In particular, preeroded targets were reexamined after additional single impacts. The strength of the surface layer was estimated by a simple tape experiment, which also supplied information of the size and morphology of presumptive wear debris. Two major erosion mechanisms were distinguished: cutting erosion—detachment of crater lips by cutting action of one or several impacts; and deformation erosion—detachment of material by surface fragmentation due to multiple cumulative impacts. Surface layer hardness and ductility are the most important material properties for cutting and deformation erosion resistance respectively. (30 refs.)

77765 Geometrical aspects of the tribological properties of graphite fiber reinforced polyimide composites. R.L.Fusaro (NASA, Lewis Res. Center, Cleveland, OH, USA).

ASLE Trans. (USA), vol.26, no.2, p.209-21 (April 1983).

A Latin-square statistical experimental test design was used to evaluate the effect of temperature, load, and sliding speed on the tribological properties of graphite fiber reinforced polyimide (GFRPI) composite specimens. Hemispherically tipped composite riders were slid against 440C HT stainless steel disks. Comparisons were made to previous studies in which hemispherically tipped 400C HT stainless steel riders were slid against GFRPI composite disks and to studies in which GFRPI was used as a liner in plain spherical bearings. The results indicate that sliding surface geometry is especially important, in that different geometries can give completely different friction and wear results. Load, temperature, and sliding distance were found to influence the friction and wear results but sliding speed was found to have little effect. Experiments on GFRPI riders with 10 weight percent additions of graphite fluoride showed that this addition had no effect on friction and wear. (24 refs.)

77766 Scuffing under cyclic loading—unexpected effect of frequency. A.G.D.Smith, A.Cameron (Imperial Coll., London, England).

ASLE Trans. (USA), vol.26, no.2, p.236-42 (April 1983).

Using the hydrostatic 'disk' (or ring) machine developed in the authors' laboratory, a fluctuating load of ± 5 percent was superimposed on a steady load. At about 15 Hz the load-carrying capacity dropped by 40 percent compared with the steady value. It returned to its original value at about 60 Hz. The friction (and surface temperature) rose as the load-carrying capacity dropped. In one set of tests, the pitting life dropped from 13 hours to 30 minutes. The drop did not seem to depend on waveform and no sign of a machine resonance was found despite a careful search. The most likely explanation of the effect was thought to be a modification of the film shape due to the squeeze-film component. (13 refs.)

77767 Wear analysis. D.Scott.

Phys. Technol. (GB), vol.14, no.3, p.133-9 (May 1983).

The implications of wear cause considerable concern in industry. The problems associated with wear are outlined and techniques of wear detection, measurement and analysis are discussed. (7 refs.)

77768 Nitrogen migration during wear in an implanted steel. S.Fayeulle, D.Treheux, P.Guiraldeau (Dept. Metall. Phys.-Materiaux, Ecole Centrale de Lyon, Ecully, France), T.Barnavon, J.Tousset, M.Robelet.

Ser. Metall. (USA), vol.17, no.4, p.459-62 (April 1983).

Nitrogen migration during wear, though assumed for several years, is still not well understood and few studies have been able to clearly show it. The authors present results of a study on this migration using Z 200 C13 steel (13% Cr, 2% C). Previous studies have shown that the nitrogen penetration passes through a maximum as a function of fluence. The present authors have found that the maximum occurred near $2 \times 10^{19} \text{ }^{15}\text{N}^+ \text{ cm}^{-2}$. (10 refs.)

77769 Fretting of amorphous alloys. R.Becker, G.Sepold (Bremer Inst. für Angewandte Strahltech., Bremen, Germany).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.295-9.

Amorphous surface layers produced by bonding Metglas ribbons on to steel specimens were tested for their resistance to fretting. Friction and weight loss were determined and the worn surfaces were examined optically. There was no general tendency towards a better wear resistance of the tested amorphous metals as compared to crystallized metals or to a simple structural steel. The results are discussed. (7 refs.)

77770 Wear of transition metal rich glassy alloys. S.H.Whang, B.C.Giesen (Materials Sci. Div., Northeastern Univ., Boston, MA, USA).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.301-8.

Reviews the results of a systematic investigation of the wear behavior of several types of glassy alloys rich in transition metals, focussing on the coefficient of friction, wear rate, surface morphology and wear mechanism. (10 refs.)

77771 Variation of optical inhomogeneity of ruby crystals. V.S.Konevskii, E.V.Krivososov, L.A.Litvinov.

Sov. J. Opt. Technol. (USSR), vol.49, no.9, p.574-6 (Sept. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.9, p.35-7 (Sept. 1982).

The optical inhomogeneity of ruby, grown by the Verneuil method under diverse conditions (for a convex, concave-convex and plane growth isotherm), has been investigated. The optical inhomogeneity of these crystals has been

studied as a function of the annealing conditions at a temperature near the melting point ($T_{\text{ann}} = T_{\text{melt}} - 10^\circ\text{C}$). (8 refs.)

77772 Changes of the surface composition of glass during reactive and argon ion etching. C.Jech, Z.Bastl (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).

Radiat. Eff. Lett. Sect. (GB), vol.76, no.1-2, p.25-8 (1983).

Removal of a radioactive implant (^{212}Pb + ^{212}Bi) from a glass surface was measured during reactive CF_4 and argon ion etching and accompanying changes in the surface composition were determined using ESCA. During reactive etching in CF_4 the formation of fluoride (Na,Ca,Mg) surface layers was observed. The high etching rate at low pressure of CH_4 can be explained by the combined action of the reactive etch of the silica component and RF sputtering of the residual nonvolatile fluorides. (3 refs.)

77773 Determining the maximum permissible operating temperatures for ceramics in aggressive media. M.I.Kushel', Yu.Ya.Eiduk, B.M.Shabrov, V.V.Kovalenko (Riga Polytech. Inst., Riga, USSR).

Glass & Ceram. (USA), vol.39, no.5-6, p.296-8 (May-June 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.6, p.21-3 (June 1982). [received: March 1983]

It is shown that, in order to establish the maximum permissible operating temperature for a ceramic material exposed to an active reagent, it is sufficient to determine experimentally two values of the corrosion rate at high temperatures (above 100°C). (7 refs.)

77774 Fabrication of ZrN coatings. J.J.Cuomo, P.A.Leary, D.S.Yee (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5506 (April 1983).

Describes a reactive sputtering process for the fabrication of ZrN coatings which are used in decorative applications to produce articles that are gold colored, conductive, and wear resistant. (no refs.)

77775 Real-time etch plasma monitor system. H.A.Khoury (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5721-3 (April 1983).

The monitor features an optical grating for dispersing the plasma radiation into specific wavelengths, a photodiode array for sensing the intensities of the various wavelengths and data processing means for digitizing the diode array signals and analyzing them so as to identify a plasma signature which may be used to analyze the plasma. (no refs.)

77776 Pre-clean treatment for prevention of nodular electroless nickel plating. G.R.Firth, M.A.Fury, J.M.Harvilchuck, R.L.Weisman (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.11A, p.5724 (April 1983).

An improved process is described for effectively cleaning NOVACULITE (grit) deposits on substrate surfaces prior to plating. (no refs.)

77777 Characterization of mechanochemically polished (111) surface of silicon crystal by diffuse X-ray scattering. N.Kashiwagura, J.Harada (Dept. of Appl. Phys., Nagoya Univ., Nagoya, Japan), M.Ogino.

J. Appl. Phys. (USA), vol.54, no.5, p.2706-10 (May 1983).

Diffuse X-ray scattering technique was applied to characterize the surface of a (111) silicon wafer polished mechanochemically. Extra diffuse scattering, which is considered to be attributable to localized strain fields was detected. The localized lattice distortions were of similar characteristics to those found in a (111) surface lapped with white aluminum (No. 2000) and etched by 30–60 μm [S. Yasuami and J. Harada, *J. Appl. Phys.*, 52, 3989 (1981)]. The thickness of the damaged layer induced by mechanochemical polishing was only about 15 μm , however, which is much smaller than that obtained by lapping (about 100 μm). This is the first observation of the damage in a mechanochemically polished (111) silicon surface. (6 refs.)

77778 Review of oxidation processes in plasmas. P.Friedel, S.Gourrier (Lab. d'Electronique et de Phys. Appl., Limeil Brevannes, France).

J. Phys. & Chem. Solids (GB), vol.44, no.5, p.353-64 (1983).

The authors review some of the major properties of oxygen plasma sources and describe some experimental set-ups. In a second part, they study the physical processes occurring in some specific cases of plasma oxidation and finally present some applications (Si MOS devices, Al_2O_3 capacitors, formation of the tunneling barrier of Josephson junctions). (46 refs.)

77779 Delayed fracture characteristics of soda-lime-silica glass in water. Y.Kimura, T.Yagasaki (Dept. of Chem. Engng., Kogakuin Univ., Tokyo, Japan), T.Kunio.

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.315-21 (March 1983). In Japanese.

Four points bending delayed fracture tests in deionized water were conducted by using the soda-lime-silica glass plate specimens with the initial crack and indentation pit by Vickers diamond indentation. The results show that the lateral crack morphology is a governing factor for the delayed fracture characteristics of the specimens. This fact is brought about by the crack propagation behavior. The initiated crack (radial crack) propagates around the lateral crack. (23 refs.)

77780 Passivation of GaAs surfaces. J.I.Pankove, J.E.Berkeyheiser, S.J.Kilpatrick, C.W.Magee (RCA Labs., Princeton, NJ, USA).

J. Electron. Mater. (USA), vol.12, no.2, p.359-70 (March 1983).

Exposure to atomic hydrogen lowers the decomposition temperature of GaAs. Simultaneous exposure of GaAs to atomic hydrogen and atomic nitrogen above 500°C results in a layer rich in GaN. The degree of passivation was monitored by photoluminescence. A fourfold improvement in luminescence efficiency was obtained by nitridization, while a factor-of-ten improvement can be obtained with the more complicated technique of generating an (AlGa)As skin. (11 refs.)

77781 The oxidation behaviour of hot pressed aluminium nitride. M.Billy, J.Jarrige, J.P.Lecomte, J.Mexmain, S.Yefsah (Univ. de Limoges, Limoges, France).

Rev. Chim. Miner. (France), vol.19, no.6, p.673-83 (1982). In French.

The oxidation behaviour of AlN in static air was investigated in the temperature range $1200\text{--}1700^\circ\text{C}$ on dense hot-pressed specimens prepared without additives or by using oxides (MgO , CaO , Y_2O_3) for densification. The oxidation resistance is found to be good up to 1300°C . At higher temperatures, however, this resistance is lowered in the presence of additives, except for CaO . In this case, the outward migration of Ca and its precipitation (Ca_6) at the top of the oxidation scale do not really modify the protective character of the bulk. This phenomena suggests the existence of a new nitrogen vitreous phase in the CaAlON system. (5 refs.)

77782 High-temperature adsorption of atmospheric oxygen on silicon nitride powders. V.A.Lavrenko, E.A.Pugach, P.P.Pikuza (Kiev Polytech. Inst., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.10, p.793-7 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.47-52 (Oct. 1982). [received: May 1983]
The high-temperature adsorption of atmospheric oxygen on silicon nitride powders produced by various methods and containing different amounts of impurities was studied by the derivatographic method. Experiments were carried out at 20-1000°C in air at 1.10³ Pa under nonisothermal conditions; the rate of temperature variation was 20 deg C/min. The characteristics of each system was assessed by the results of a differential thermal analysis (DTA curve) and a thermogravimetric study. (TG and DTG curves). The sensitivity of the method in all experiments was the same. Air adsorption was found to have a specific individual character for each powder. It reflected the conditions of preparation of the powder by each process, its purification and treatment with reagents, and also the state of its surface. (15 refs.)

77783 Effect of a CaF₂ addition on the oxidation of hot-pressed silicon nitride-base materials. G.I.Postogvard, I.T.Ostapenko, V.A.Zelenskaya (Kharkov Physicotech. Inst., Kharkov, Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.10, p.798-800 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.53-6 (Oct. 1982). [received: May 1983]
A study was made of the oxidation of a hot-pressed Si₃N₄-10% MgO material containing 1-20% CaF₂ as an antiriction lubricant, at 1100-1250°C. As starting material a grade 1 silicon nitride powder was used containing, in addition to combined silicon and nitrogen, 1.5% free silicon and the following impurities: more than 3% carbon, 0.3% each iron and calcium, 0.1% aluminum, 0.2% titanium, and not more than 0.1% total chromium, nickel, magnesium, copper, lead, tin, zinc, and manganese. Hot-pressed Si₃N₄-10% MgO material possessed good oxidation resistance in air at temperatures in the range 1100-1200°C. When such a material contains an antiriction lubricant (1-20% CaF₂), raising the latter's concentration increases its rate of oxidation by decreasing the viscosity of the oxide layer, which facilitates access of oxygen to the specimen surface. At CaF₂ contents of more than 5% the material lacks mechanical strength owing to the formation of a thick oxide layer and appearance of cracks. (10 refs.)

77784 Study by electron spectroscopy for chemical analysis of silicon, SiO₂ and Si₃N₄ surfaces treated with various CF₄-containing plasmas. A.Licciardello, S.Pignataro (Istituto Dipartimentale di Chimica e Chimica Industriale, Univ. di Catania, Catania, Italy), M.Panczel. *Surf. Technol. (Switzerland)*, vol.18, no.3, p.189-99 (March 1983).
Silicon, SiO₂ and Si₃N₄ surfaces were treated with three different types of commercial plasma containing CF₄. The spectra obtained in electron spectroscopy for chemical analysis of these surfaces showed relatively low carbon and fluorine contamination. The latter contaminant was found on SiO₂ or Si₃N₄ surfaces but was no longer present on the silicon-like surfaces after treatment. The results are interpreted in terms of known mechanisms of plasma etching. (15 refs.)

81.60B Metals and alloys
(inc. stress corrosion cracking; anticorrosion)

77785 Investigation on the corrosion of Ti-Al alloy in sulphuric acid. M.V.Susic (Inst. of Phys. Chem., Belgrade, Yugoslavia). *Mater. Chem. & Phys. (Switzerland)*, vol.8, no.3, p.193-202 (March 1983).
By means of chronocyclic electrochemical methods the investigation of the corrosion, i.e. the passivation of titanium and aluminium (3% Al, 0.25% Cr, 0.25% Fe, 0.25% Si) alloy was carried out. The values essential for the assessment of corrosion stability of the samples tested were determined and discussed. It was shown that by means of chronocyclic electrochemical methods reliable characteristics of corrosive behaviour of the material of this type can be determined. Differential thermal and thermogravimetric analyses showed the behaviour of the material when being heated up to 1100°C in air. (9 refs.)

77786 Electrochemical and morphological characterization of prefilmed aluminium brass. G.Brunoro (Istituto Chimico, Univ. di Ferrara, Ferrara, Italy), P.Spinelli. *Mater. Chem. & Phys. (Switzerland)*, vol.8, no.4, p.337-48 (April 1983).
Electrochemical and morphological characterization of aluminium brass prefilmed with benzimidazole-2-thiol (BIE) was made in 0.1 N sodium chloride solutions of various pHs. The prefilming treatment produces a surface layer with very good protective properties. The effect of the prefilming temperature is to increase the protectivity of the film. It was shown that the film resistance depends on the pH of the test solution. Upon prolonged immersion in the sodium chloride solution, a uniform removal of the surface film occurs, never giving rise to localized attack. An interaction between the inhibitor and the metal seems to be responsible for a marked limitation of the cathodic current density for oxygen reduction. A stabilization of the oxide layer as a consequence of the inhibitor interaction is suggested. (8 refs.)

77787 The UO₂-Zircaloy chemical interaction. D.R.Olander (Dept. of Nuclear Engng., Univ. of California, Berkeley, CA, USA). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.271-85 (April 1983).
Existing experimental data on the interaction of uranium dioxide and Zircaloy are analyzed with a model that accounts for the formation and growth of three corrosion layers between the oxide and the metal. The kinetics of the process are governed by diffusion of oxygen and uranium in the five-zone system with chemical equilibrium at four interfaces. Three of the zones consist of two elements and are treated by conventional scaling theory. Transport of all three elements (Zr, U, and O) occurs in the remaining two zones, one of which consists of two coexisting phases. Modeling of the system results in product layer growth rates which are in good agreement with the experimental results at 1500°C, which is the only temperature that both kinetic and thermodynamic information is available for application of the theoretical model. (24 refs.)

77788 Relative critical potentials for pitting corrosion of 304 stainless steel, Incoloy 800 and Inconel 600 in alkaline high-temperature aqueous solutions. W.F.Bogaerts, A.A.Van Haute, M.J.Brabers (Electrochem. & Corrosion Lab., Univ. of Leuven, Heverlee, Belgium). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.339-42 (April 1983).
Describes electrochemical corrosion tests conducted on Inconel 600 at temperatures up to 300°C and pressures up to 100 bar (10 MPa) in neutral and alkaline chloride solutions. The major objective of the tests was to determine the influence of solution temperature and composition (e.g. pH, Cl⁻ concentration) and of the alloy composition (Fe, Cr and Ni content) on the pitting corrosion behaviour of these austenitic materials. (9 refs.)

77789 Behaviour of alloying elements in high-temperature (1600°C-1800°C) transient oxidation of Zircaloy-4 LWR cladding tubes. M.Cambini, P.Bottelier, G.Buscaglia, C.Miglierina (Joint Res. Centre, Ispra Establ., Ispra, Italy). *J. Nucl. Mater. (Netherlands)*, vol.115, no.2-3, p.343-6 (April 1983).
Oxidation tests were performed on LWR Zircaloy-4 pipe segments. The results indicated that, under oxidising conditions at high temperature, the great majority of the alloying elements are transported in liquid form to the inner zone of the tubes. Since the thermodynamic activity of Zr in this liquid enriched in the alloying elements is lower than that of α-Zr(O), the oxidation of this latter phase is preferred. (10 refs.)

77790 The role of the electrode potential control in corrosion research of stress corrosion crack growth propagation in austenite stainless steels for nuclear reactor components. B.Eremias (Statni Vyzkumny Ustav Ochraný Materialu G.V. Akimova, Praha, Czechoslovakia). *Jad. Energ. (Czechoslovakia)*, vol.29, no.5, p.180-2 (May 1983). In Czech.
The role of the electrode potential control in stress corrosion crack growth propagation process is briefly discussed. Special attention is paid to the application of potentiostatic method in study of stress corrosion cracking of austenitic stainless steels for nuclear reactor components in high temperature water. (3 refs.)

77791 High temperature oxidation of vanadium-chromium alloys by low pressure oxygen. M.Yamawaki, T.Yoneoka, M.Kanno (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan). *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.389-97 (1983). In Japanese.
Oxidation behaviour of vanadium-chromium alloys containing 5 and 10 at.% chromium has been investigated at temperatures ranging from 800 to 993K and at oxygen pressures at 1.33 and 133 Pa by means of a thermobalance, an X-ray diffractometer, an electron probe microanalyzer, a microhardness tester as well as metallographic techniques. Whereas mass gain due to oxidation initially followed the parabolic rate law, it then turned into very slow linear kinetics. Consequently, the oxidation resistance of vanadium was highly improved, especially at lower temperatures, lower oxygen pressures and higher chromium concentrations. Both alloys exhibited similar oxidation kinetics and scale structures. The oxide scale consisted mostly of a monolayer of VO₂ of low chromium content (≤0.65 mol.% Cr₂O₃) except for the oxidation at 993K and 133 Pa. A very thin chromium-concentrated layer (≤0.2 μm) was formed at the oxide scale-alloy substrate interface, to which could be attributed the retarded diffusion of vanadium into the oxide scale as well as that of oxygen into the substrate. (23 refs.)

77792 The selective dissolution of SUS04 and SUS16 austenitic stainless steels in a hydrochloric acid solution. R.Nishimura, M.Araki, K.Kudo (Corrosion Engng. Div., Government Industrial Res. Inst. of Chugoku, Kure, Japan). *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.413-19 (1983). In Japanese.
The anodic behavior and selective dissolution of SUS304 and SUS316 austenitic stainless steels were investigated as a function of potential in a 1 kmol.m⁻³ HCl solution by using electrochemical technique and inductively coupled plasma emission spectrometry (ICP). On the basis of the comparison between the amount of total anodic charge passed and that of electric charge obtained from dissolution, it was found that the anodic polarization curves of SUS304 and SUS316 were divided into three regions, the active dissolution, the film formation, and the film destruction. The compositions of metal ions dissolved in the solution revealed that the preferential dissolution of Fe took place on both steels in the active dissolution region and led to the enrichment of Cr on SUS304 surface and that of Cr, Ni and Mo on SUS316 surface. In the region of the film formation, it was found that a film formed on SUS304 was enriched with Cr because of the preferential dissolution of Fe. In the case of SUS316, it was suggested in terms of the preferential dissolution of Ni and Mo that a film changed from Cr, Ni, Mo-rich layer into Cr-rich layer during anodic oxidation. It was, furthermore, deduced that Mo lowered the activity or density of active centers such as MnS on SUS316 surface in the process of active dissolution and consequently contributed to the formation of a uniform film free from defects. (15 refs.)

77793 Damping capacity and pitting corrosion resistance of Fe-Mo-Cr alloys. H.Masumoto, S.Sawaya, M.Hinai (Res. Inst. of Electric & Magnetic Alloys, Sendai, Japan). *J. Jpn. Inst. Met. (Japan)*, vol.47, no.5, p.439-45 (1983). In Japanese.
The damping capacity and the anodic polarization behaviour in a 3%NaCl solution were studied on Fe-Mo-Cr alloys containing 1-16%Mo and 2-35%Cr after various heat-treatments. Measurement of the internal friction Q⁻¹ was carried out by the inverted torsion pendulum method at a frequency of 1 Hz. The tensile strength σ_t and the pitting potential E_p were measured using an Instron-type testing machine and a potentiostat, respectively. In the state of furnace-cooling, the Q⁻¹ value of the Fe-Mo-Cr alloys with small amounts of Mo and Cr is considerably high, while the alloys with large amounts of Mo and Cr are low in Q⁻¹ because the intermetallic compounds precipitate in the ferromagnetic α phase matrix. On the other hand, the numerous alloys subjected to water-quenching are fairly high in Q⁻¹ because of the single phase α solid solution. The σ_t in both the state increases considerably with increasing Mo and Cr contents. The increment in σ_t upon furnace-cooling is more than that in the case of water-quenching. The E_p value of the furnace-cooled

alloys is generally low, while the numerous alloys become higher in E_p by water-quenching where high Q^{-1} value appears. (19 refs.)

77794 Improvement of corrosion fatigue strength of notched high strength steel by partial unloading method. M.Kido (Hiroshima Inst. of Technol., Hiroshima, Japan), K.Nakasa, H.Takei. *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.32, no.354, p.310-14 (March 1983). In Japanese.

The effect of partial unloading on the corrosion fatigue strength in water was investigated on the notched specimens of SNCM439 steel quenched and tempered at 473K. The corrosion fatigue strength was markedly increased by the partial unloading method. This fact may be explained by the decrease of tensile stress at the notch root surface which suppresses the destruction of the protective film due to repeating slips in the material and prevent the corrosion reaction. (8 refs.)

77795 The application of high resolution electron microscopy to the study of oxidation. S.B.Newcomb (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England), D.J.Smith, W.M.Stobbs. *J. Microsc. (GB)*, vol.130, pt.2, p.137-46 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). High resolution electron microscopy has been used to examine both the similarities and differences in the growth morphologies of Fe_2O_3 , Cr_2O_3 as formed on iron alloys, and MgO as formed by burning Mg in moist air. A general discussion is also given of the relative advantages and disadvantages of a variety of TEM techniques as applicable to the study of oxidation phenomena. (20 refs.)

77796 The transmission electron microscopy of oxide scale formation on Fe-Ni-Cr alloys. S.B.Newcomb, W.M.Stobbs (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *J. Microsc. (GB)*, vol.130, pt.2, p.233-48 (May 1983). (MICRO 82: High Resolution Electron Microscopy, London, England, 12-16 July 1982). The oxidation behaviour of 10 Cr and 20 Cr iron alloys, with nickel contents from 0 to 34 wt.% both in air and in CO/CO_2 , is summarized with particular emphasis on the form and chemistry of the different scales as they were observed using transmission electron microscopy. The various modes of inward oxidation are for example characterized with 'internal' and 'inner' oxidation taking place under different circumstances. The role of carbon during oxidation in a CO/CO_2 atmosphere is also discussed as is the way in which a given alloy can show either chemical or mechanical passivation failure in different environments. (25 refs.)

77797 The effect of molybdenum addition on the mechanical metallurgy and corrosion properties of the 13Cr4%Ni steel. J.Hubackova (CSAV, Ostrava-Poruba, Czechoslovakia), V.Cihal, K.Mazanec. *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.131-41 (1983). In Czech. The susceptibility to the temper embrittlement of the 13Cr4%Ni steel (occurring to a limited extent) has been completely eliminated by the addition approximately of 0.5% molybdenum. This addition leads to the improvement of corrosion resistance; the susceptibility to the intergranular corrosion has been reduced only partially. By addition of 1.48% Mo the toughness has not been improved, but the corrosion resistance has been considerably increased and the susceptibility to the intergranular corrosion of 13Cr4%Ni steel eliminated. The evaluation of the corrosion resistance, susceptibility to the intergranular corrosion and the extent of re-austenitization during the tempering at intercritical temperatures can be carried out by means of the modified potential polarization method, based on the measurements of the electrochemical parameters particularly after the reactivation from the complete or incomplete passivation region. (10 refs.)

77798 Ion nitriding behavior of several low alloy steels. C.V.Robino, O.T.Inal (Dept. of Metall. & Materials Engng., New Mexico Inst. of Mining & Technol., Socorro, NM, USA). *Mater. Sci. & Eng. (Switzerland)*, vol.59, no.1, p.79-90 (May 1983).

The ion nitriding behavior of several low alloy steels, US Steel T1 type A, AISI 4140, AISI 6150 and Nitralloy 135M, has been examined under varying process conditions using microhardness-depth correlations, friction and wear measurements, optical microscopy and transmission electron microscopy. The process variables included time (2-48 h) and temperature (400-600°C). All four steels exhibited a diffusion layer case growth rate which was dependent on the square root of the exposure time. The highest nitrided hardnesses and lowest case depths were observed in the Nitralloy 135M steel while the lowest hardnesses and highest case depths were seen in the T1 steel. In general the behaviors of the T1, AISI 4140 and AISI 6150 steels were similar. The white layer thickness was independent of the material and increased with increasing treatment time. Both the case depth and the white layer thickness were found to increase strongly with temperature while the hardness decreased. (26 refs.)

77799 Effects of segregated phosphorus on stress corrosion cracking susceptibility of 3Cr-0.5Mo steel. G.T.Burstein, J.Woodward (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *Met. Sci. (GB)*, vol.17, no.3, p.111-16 (March 1983). An examination has been made of the rate of intergranular stress corrosion cracking (SCC) of 3Cr-0.5Mo steel in hot 8 M NaOH solution as a function of the heat treatment of the alloy. The results show that the rate of SCC is extremely sensitive to the concentration of segregated phosphorus in the grain boundaries. Analysis of the segregation levels of trace elements after the steel had been heat treated at 823K for different times is presented. (22 refs.)

77800 Fatigue corrosion behaviour of various metallic materials in chloride environment. M.Truchon (Inst. de Recherches de la Siderurgie Francaise, Saint-Germain-en-Laye, France), P.Rabbe. *Mem. & Etud. Sci. Rev. Metall. (France)*, vol.80, no.3, p.117-30 (March 1983). In French.

Results of fatigue corrosion tests carried out in synthetic sea water A3 for three stainless steels, a structural steel and an aluminium alloy are presented. Their resistance at the initial and the propagation stage is evaluated. (26 refs.)

77801 Oxidation kinetics of Cu-Zn-Al alloys. D.Farkas, G.Nunez (Dept. Metalurgia, Fac. Univ. Nacional Autonoma de Mexico, Mexico City, Mexico). *Ser. Metall. (USA)*, vol.17, no.4, p.505-8 (April 1983).

The influence of composition on the oxidation kinetics of Cu-Zn-Al alloys has been studied. The results indicate that for lower Zn contents the Al content needs to be as high as 4% to ensure protective properties of the scale. (8 refs.)

77802 Mathematical model of corrosion fatigue. F.F.Azhogin, Yu.S.Goryachko, Yu.G.Ozhiganov. *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.350-5 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.69-75 (July-Aug. 1982). [received: May 1983]

From the concepts developed of the mechanism of fatigue and corrosion fatigue failure the following conclusions are drawn: there exists a physical corrosion fatigue limit; the relationship of the number of cycles until failure

N to the level of tensile stresses σ is described by the equation $(\sigma - A)\sqrt{N} = K_{\sigma}$; in the presence of a strengthened layer with large amplitudes of oscillations a break is formed on the corrosion fatigue curve in σ vs. $1/\sqrt{N}$ coordinates. The treatment of experimental data on the corrosion fatigue of carbon, low-alloy, high-chrome, and chrome-nickel steels presented in many works of many authors show that these data satisfy the derived equation of the corrosion fatigue curve. (45 refs.)

77803 Temperature stresses in a plate in friction hardening. Yu.M.Kolyano, Yu.I.Babei, V.Z.Didyk, B.M.Korduba (Inst. of Appl. Problems of Mech. & Math., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.4, p.356-62 (July-Aug. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.4, p.75-81 (July-Aug. 1982). [received: May 1983]

The authors have determined the temperature fields and the thermally stressed condition of a metal plate occurring in friction hardening and have investigated the influence of heat transfer out of the heating area on the temperature stresses. (6 refs.)

77804 Surface reinforcement of iron-base materials. B.S.Mitin, V.K.Narva, N.T.Salibaev (Moscow Inst. of Steel & Alloys, Moscow, USSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.10, p.780-4 (Oct. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.10, p.33-8 (Oct. 1982). [received: May 1983]

A study was made of the application of a wear-resistant TiC-Kh12M steel layer to type 45 steel by methods consisting in simultaneous pressing and sintering and in the sinter-bonding of a pressed or sintered layer to a sintered base. It has been established that the alloying of the basis material with 1% of Cu substantially increases its density and adhesion to the coating. It is shown that a layer can be applied to a sintered base with or without a substrate. It has been found that the highest bond strength, $(10-14) \times 10^7$ Pa, is attained when a layer and a base containing 1% of Cu are simultaneously pressed under a pressure of 3.10^8 Pa and then simultaneously sintered at 1673K. (5 refs.)

77805 A possibility to obtain microdiscontinuous chromium coatings by cathodic treatment in acidic media. S.Rashkov, M.Monev, N.Atanassov (Inst. of Phys. Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Surf. Technol. (Switzerland)*, vol.18, no.3, p.201-7 (March 1983).

A possibility is described for obtaining microdiscontinuous chromium coatings by cathodic treatment of conventional chromium electroplates in sulphuric acid solutions in the presence of selenite ions. The relationships are determined between the microdiscontinuities formed in the chromium coatings and the cathodic treatment conditions (duration, selenite ion concentration and pH of the medium) and the thickness of the chromium layer. The microporous and microcracked chromium coatings formed by this method substantially improve the corrosion resistance of the Ni/Cr system. (10 refs.)

77806 Some possibilities for the use of stressed cathodically hydrogenated electrolytic nickel coatings for the deposition of microporous and microcracked chromium plates. S.Rashkov, M.Monev, N.Atanassov (Inst. of Phys. Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Surf. Technol. (Switzerland)*, vol.18, no.3, p.217-23 (March 1983).

It has been established that hydrogenated bright nickel coatings containing nickel hydride as the surface phase, owing to the properties of the latter (disintegration into molecular hydrogen creating high internal stresses), can be used for the plating of microporous and microcracked chromium coatings, depending on their thickness. Similar chromium coatings improve the corrosion resistance of the Ni-Cr system. It is proposed that the formation of microcracked chromium coatings on bright nickel during direct deposition from electrolytes containing selenite ions is related to the formation of a stressed nickel layer as a result of the appearance and disintegration of nickel hydride formed during the initial stages of chromium plating. (20 refs.)

77807 Surface alloying of iron alloys by laser beam melting. B.L.Mordike, H.W.Bergmann (Inst. fur Werkstoffkunde und Werkstofftech., Univ. of Clausthal, Clausthal, Germany).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.463-83. The surface heat treatment of iron alloys using high power lasers is reported. The essential features, e.g. epitaxial growth, homogeneity, etc., are discussed. The results are tabulated for the technically important alloys. The possibilities of laser hardening are demonstrated by four examples. (10 refs.)

77808 Production and properties of amorphous layers on metal substrates by laser and electron beam melting. H.W.Bergmann, B.L.Mordike (Inst. fur Werkstoffkunde und Werkstofftech., Tech. Univ. Clausthal, Clausthal, Germany).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.497-503. Various techniques of laser glazing are presented. Rules are given for the choice of systems which are suitable for producing amorphous surface layers. Methods of demonstrating the existence of a truly amorphous layer are discussed. Two examples are given: (1) electron beam glazing of Ni-Nb coated single crystals, (2) laser beam glazing of Fe-B coated Fe-Cr-C cold working steel. (5 refs.)

77809 Laser surface treatment of aerospace steels. G.Christodoulou, P.Henry, W.M.Steen, D.R.F.West (Dept. of Metall. & Materials Sci., Imperial Coll., London, England).

Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.505-10.

An investigation is reported of the laser surface melting of four alloy steels with carbon contents ranging up to 1 wt%. Studies were made of the profiles, microstructures and hardnesses of zone produced using a laser power of 1.7 kW and a range of traverse speeds and beam diameters. The observed zone profiles were correlated with calculations from a three-dimensional, moving source, heat transfer model. In the high carbon steels, the shallow laser melted zones contained substantial amounts of retained austenite. (7 refs.)

77810 Surface melting of cast iron with a high power laser beam. Y.Nilsen (Dept. of Casting Metals, Royal Inst. of Technol., Stockholm, Sweden). Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.517-21.

An investigation is done on partial surface hardening and alloying on cast iron by means of a high power laser beam. Samples of cast iron have been covered with alloying material, i.e. Ti, Cr, Si, V and Nb respectively. The samples were irradiated with a 2.5 kW laser beam. A partial melting of the surface occurred and the alloys were dissolved. The carbide structure in the resolidified part was governed by the alloy addition. The carbide structure was metallographically analysed. The effect of different parameters as beam

diameter, scanning rate, power and alloy content have been investigated and the crack frequency has been evaluated. (2 refs.)

77811 Property enhancement in rapidly quenched alloy surfaces. M.Tuli (Pilgrim Materials Corp., South Windsor, CT, USA), P.R.Strutt. Rapidly Solidified Amorphous and Crystalline Alloys. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.535-9. Electron beam glazed surfaces on a circular bar are of sufficiently good quality either for direct use or after light mechanical grinding. The technique may be applied for reconstituting plasma deposited layers thereby eliminating porosity and obtaining a highly homogeneous refined microstructure. By this treatment it was found that the microhardness of a plasma deposited layer of chromium carbide in molybdenum binder increased from 525 VHN to 750 VHN. (5 refs.)

81.70 MATERIALS TESTING

(inc. sample preparation for examination, metallographic techniques, ion and electron microprobe techniques, Auger and photoelectron techniques, defectoscopy; for measurement in the mechanics of solids and rheology, see 46.30R)

77812 Technique to predict specimen failure in cyclic fatigue tests. N.Tamada, Y.Iwasa (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).

Appl. Phys. Lett. (USA), vol.42, no.9, p.799-800 (1 May 1983). The authors report a technique with which to predict specimen failure from cyclic fatigue tests. The technique observes one of the resonant frequencies of the specimen. A definite shift in the resonant frequency has been seen to occur preceding failure; this shift may be used to predict specimen failure. (4 refs.)

77813 Study on surface crack opening displacement and its applications in pressurized vessels and pipings. Yang Fangyu, Wang Yanyan, Qin Hong, Li Huirong, Gao Guilan (Dalian Inst. of Technol., China).

Acta Mech. Sin. (China), no.1, p.34-44 (1983). In Chinese. Presents a simple method to estimate the surface crack opening displacement (SCOD) of tension specimens and pressurized vessels. To date, the only procedure for estimating SCOD is introduced by A.S. Kobayashi (1976). In order to examine the proposed method experiments have been performed on crack growth and fracture in plate specimens and cylinders. Good agreement between predicted and experimental results has been obtained as shown by curves of normalized SCOD versus normalized depth of crack. One of the applications of SCOD equation is to evaluate the depth of surface crack in plates or vessels. A procedure for estimating crack depth is presented. SCOD equation can be also be used to monitor crack growth in pressurized vessels and pipings. A new experimental procedure for evaluating crack growth d/dN and ΔK_I without any mechanical or thermal moving on the tip of crack has been developed. The measuring technique of SCOD in flawed tension plates and cylinders is explained in detail. (10 refs.)

77814 Method of testing glass for strength with constant loading rate. D.L.Orlov, E.A.Abramyan, A.A.Perova, R.Leieritis. *Glass & Ceram. (USA)*, vol.39, no.5-6, p.277-9 (May-June 1982). Translation of: *Steklo & Keram. (USSR)*, vol.39, no.6, p.12-13 (June 1982). [received: March 1983]

A method is described which permits one to use ordinary tensile testing machines without electronic regulation of the loading rate to test glass at constant loading rate. (2 refs.)

77815 Advances in instrumentation for materials characterization. R.M.Fisher (Corporate Res., US Steel Res., Monroeville, PA, USA).

J. Met. (USA), vol.35, no.3, p.42-5 (March 1983). Most of what is known about the complexities of the effects of microstructure on the properties of alloys has resulted from scientific studies of metal structures. Since the phases and features that most strongly affect metal properties are of the size range 10^{-1} to 10^{-7} mm, sophisticated instruments are required to observe, identify, and characterize them. Recent developments and trends in this type of instrumentation as applied to metals and metallic phases are summarized. (11 refs.)

77816 Present status and problem of high temperature corrosion testing methods. Y.Harada (Takasago Tech. Inst., Mitsubishi Heavy Industries Ltd., Takasago, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.349, p.999-1011 (Oct. 1982). In Japanese. [received: April 1983]

Methods and considerations for the corrosion test and assessment of engineering components and structures for high-temperature applications are described. High-temperature corrosion tests provide significant data for assessing the applicability of a corrosion protection technique of interest. A brief outline is given of the methods: (1) burning tests using experimental burning equipment; (2) heating tests for a test piece coated with or immersed in corrosion activator; (3) measurements of the quantity of oxygen consumed for the corrosion reaction of a test piece in a furnace; and (4) electrochemical tests. In addition, test conditions and environment control are summarized. (52 refs.) K.B.

77817 X-ray investigation of stress measurement of heat resisting materials (on the X-ray elastic constants and the residual stresses of nickel base alloy). J.Arima, Y.Iwai (Nara Tech. Coll., Nara, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.32, no.354, p.277-83 (March 1983). In Japanese.

The elastic constants of a nickel base alloy at high temperatures were studied by the X-ray method with a new apparatus consisting of a horizontal type tensile testing machine and a vacuum furnace. Residual stresses due to precipitation hardening were also studied. The microstructure of the material was observed at various temperatures. After the heat treatment for precipitation hardening, all the plate specimens of Inconel X were finished and then electropolished before being exposed to X-rays. The strain was determined by measuring the diffraction from the (311) atomic plane by means of the conventional $\sin^2\psi$ diagrams using a counter technique. The elastic constants of Inconel X obtained by the X-ray technique are in good agreement with those measured mechanically within the experimental errors. The lattice spacings or lattice constants changed about 5.2 degree in 2θ from room temperature at 923K. (18 refs.)

77818 Fractographic examination in the scanning electron microscope as a tool in evaluating through-thickness tension test results. M.M.McDonald, D.C.Ludwigson (Res. Lab., United States Steel Corp., Monroeville, PA, USA).

J. Test. & Eval. (USA), vol.11, no.3, p.165-73 (May 1983). The through-thickness tension tests is used to assess resistance to lamellar tearing. Observed through-thickness reduction-of-area (TTRA) values are usually well above the 20% minimum specification level in steels produced for lamellar-tearing-resistant applications. Low TTRA values, when encountered, indicate susceptibility to lamellar tearing but provide little indication of the source of premature fracture. Fractographic examination, especially with the scanning electron microscope, provides information about the origins of low ductility. Sources of premature fracture discussed herein are indigenous inclusions, exogenous inclusions, occluded hydrogen, undissolved alloy additions, and solidification microvoids. (15 refs.)

77819 Numerical analysis of ductile fracture experiments using single-edge notched tension specimens. T.Hollstein (Fraunhofer-Inst. fur Werkstoffmech., Freiburg, Germany), W.Schmitt, J.G.Blaue.

J. Test. & Eval. (USA), vol.11, no.3, p.174-81 (May 1983).

The elastic compliance C and the J -integral are investigated for single-edge notched tension specimens. The parameters are discussed with respect to crack length, thickness of specimen; load level, stress state, and loading system. Test results for a structural steel St E 460 (nickel-vanadium) at room temperature are presented together with two- and three-dimensional finite element calculations for some of these specimens. The overall specimen behavior including J for the 10-mm-thick specimens is reproduced by a plane stress model. Even the 40-mm-thick specimens are better modelled in plane stress than in plane strain. The strong influence of the angular stiffness of the loading system on the specimen behavior is demonstrated. For the experimental arrangement used in this study a single-specimen estimation procedure is developed to calculate J from the work done on the specimen. (18 refs.)

77820 Stressing for test purposes of materials in tubular form using elastomeric inserts—practical testing procedures. K.Mosley (Dept. of Sci. & Industrial Res., Lower Hutt, New Zealand).

J. Test. & Eval. (USA), vol.11, no.3, p.182-92 (May 1983).

Describes mainly the practical aspects of a simple and rapid method of elastic hoop stressing materials in tubular form using elastomeric inserts. The method can be used for stressing to required limits, for testing to fracture, or for obtaining yield loads. It is extremely suitable for the testing of brittle materials. Stress equations and insert specimen coefficients of friction are given in the appendixes. (3 refs.)

77821 An improved method for threshold fatigue crack propagation testing on an electromagnetic resonance type machine. S.Nishijima, S.Matsuoka, S.Ohtsubo (Nat. Res. Inst. for Metals, Tokyo, Japan).

J. Test. & Eval. (USA), vol.11, no.3, p.193-201 (May 1983).

An improved technique for fatigue crack propagation testing is proposed for the determination of threshold stress intensity range ΔK_{th} using an electromagnetic resonance type testing system. A special device is used to compensate for the change of specimen compliance during the test. It is composed of a set of transverse mutually hinged at one end between which an elastic body and a specimen are mounted in parallel, respectively, at predetermined distances from the hinge, so that the resultant composite compliance of the device is designed to be practically insensitive to the change of specimen compliance. A series of ΔK_{th} measurements was performed at various load ratios of six steels of various strength levels, using small compact type (CT) specimens of 25 mm width and 5 mm thickness, under combined control modes of the applied load and the backface strain of the specimen. The use of the compliance stabilizing device improved markedly the controlling stability of the testing machine and facilitated the determination of ΔK_{th} value under auto-decreasing ΔK conditions at high load ratios. The obtained ΔK_{th} values from the experiments were in excellent agreement with those found in the literature. (10 refs.)

- 77822 A new transducer to monitor fatigue crack propagation.** P.K. Liaw (Westinghouse Electric Corp., Res. & Dev. Center, Pittsburgh, PA, USA), H.-R. Hartmann, W.A. Logsdon. *J. Test. & Eval. (USA)*, vol.11, no.3, p.202-7 (May 1983).
A sputter deposition technique has been successfully used to fuse automatically a high-temperature DC transducer, in the form of a thin film Krak-Gage, directly onto a test specimen for developing fatigue crack propagation rate data. The rates of fatigue crack growth measured by this technique are in good agreement with those measured by the compliance method at 288 and 427°C (550 and 800°F). The data acquisition and analysis are automated by interfacing with a computer which saves costly labor associated with fatigue crack growth tests. This new development, based on thin film sputtering technology, is expected to enable researchers to conduct fatigue and fracture mechanics testing in various adverse high-temperature environments. (10 refs.)
- 77823 On the yield loads of plates with array of holes.** U.C. Jindal, M.L. Mandal (Mech. Engng. Dept., Delhi Coll. of Engng., Delhi, India). *J. Test. & Eval. (USA)*, vol.11, no.3, p.208-16 (May 1983).
Yield loads of mild steel plates with one, three, five, and nine holes in different combinations and orientations have been determined experimentally using an Instron universal testing machine. The yield loads of these specimens were very close to the yield loads of the specimens without holes. It was further observed that for up to a 30% reduction in area in the critical section (along which final fracture takes place), the yield load remains the same. Specimens with a single hole were also studied under moderately dynamic strains, up to a strain rate of 0.42/min. It was observed that yield load and yield point elongation increased with increasing strain rate. This showed that a hole in the specimen has negligible effect on these properties of the specimen. (12 refs.)
- 77824 J_{Ic} measurement point determination for HY130, CMS-9, and Inconel Alloy 718.** J.R. Matthews (Defence Res. Estab. Pacific, Victoria, BC, Canada), G.D. West. *J. Test. & Eval. (USA)*, vol.11, no.3, p.217-24 (May 1983).
Determination of the elastic-plastic fracture toughness for three medium strength materials of varying ductility has been carried out. The materials in order of decreasing ductility are HY130 steel, CMS-9 steel, and Inconel Alloy 718. A survey of measurement-point techniques for J_{Ic} has been incorporated in the study to evaluate the effect of ductility of the determination of the elastic-plastic fracture parameter and subsequent estimation of the elastic fracture toughness K_{Ic} . (14 refs.)
- 77825 Development and applications of tester with twin bar for alloy solidification.** Jr. Chen Guangjun Zhao (Dept. of Mech., Dalian Inst. of Technol., Dalian, China). *J. Dalian Inst. Technol. (Dalian Gongxueyuan Xuebao) (China)*, vol.21, no.4, p.133-9 (Dec. 1982). In Chinese. [received: June 1983]
In order to study the alloy factor effect in connection with casting defects causing hot tearing, cold tearing, flexure, deformation and residual stress, the author has designed and developed a twin bar tester for alloy solidification contraction. (8 refs.)
- 77826 Assessment of critical temperature of embrittlement and transverse widening of the test piece in impact bend test.** J. Wozniak, M. Jakob (Vitkovice Zelezarny a Strojirny Klementa Gottwalda, Koncernovy Podnik, Ostrava-Vitkovice, Czechoslovakia). *Kovove Mater. (Czechoslovakia)*, vol.21, no.2, p.206-12 (1983). In Czech.
The authors summarize the experimentally determined values of lateral expansion and the percentage of ductile fracture with a given type of steel. From the comparison of the results obtained it was found that the method of lateral expansion evaluation is more exact than the method of ductile fracture measurement. It is not possible to apply lateral expansion criteria of ASME Code for the testing equipment used in our laboratories. It is necessary to compile a larger amount of experimental material from various laboratories to be able to fix the limit value of lateral expansion replacing the up-to-now used limit of 50 percent ductile fracture. (11 refs.)
- 77827 Measurement of crack profile of semi-elliptical surface cracks using the AC potential technique.** A.A. Aboutorabi, M.J. Cowling (Dept. of Mech. Engng., Univ. of Glasgow, Glasgow, Scotland). *NDT Int. (GB)*, vol.16, no.3, p.139-43 (June 1983).
The growth of semi-elliptical surface cracks by fatigue was monitored by the AC potential technique. Detailed marking of the fracture surface during crack growth allowed correlation of crack profile and potential measurements. A series of modification factors has been produced to allow accurate sizing of such defects from a simple NDT technique. (11 refs.)
- 77828 Stress-shadow magnetic inspection technique for far-side anomalies in steel pipe.** D.L. Atherton (Dept. of Phys., Queen's Univ., Kingston, Canada). *NDT Int. (GB)*, vol.16, no.3, p.145-9 (June 1983).
A two-step process for obtaining strong magnetic leakage flux signals from far-side anomalies in steel pipe is described. The pipe is magnetized by a magnetic pig while it is stressed by line pressure. Anomalous local stresses on the near side of the steel caused by far-side corrosion produce anomalies in the residual magnetization. These near-side residual field anomalies due to the stress shadows from exterior corrosion are then readily detectable. Initial laboratory tests are described. (1 ref.)
- 77829 Some results on the resolution of small inclusions in ultrasonic immersion testing of steel with focused probes.** G. Canella, F. Monti, L. Pedicelli, A.L. Erede (Centro Sperimentale Metall., Roma, Italy). *NDT Int. (GB)*, vol.16, no.3, p.151-3 (June 1983).
Results are presented for an analysis of ultrasonic signals reflected from small flaws (≤ 1 mm) in steel samples during immersion testing with 10 MHz and 15 MHz focused probes. A technique is introduced for setting up the working parameters in ultrasonic testing of flat specimens to take account of the position of inclusions relative to the focal zone, according to the thickness of the layer to be examined and the resolution required. (10 refs.)
- 77830 Fracture toughness (K_{Ic}) testing with a mini-compact tension (CT) specimen.** C.Y.-C. Lee, W.B. Jones Jr. (Materials Lab., Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH, USA). *Polym. Eng. & Sci. (USA)*, vol.22, no.18, p.1190-8 (Dec. 1982).
A testing method using the rheometrics mechanical spectrometer as the loading instrument to measure the fracture toughness K_{Ic} , which is related to a specific sample geometry and dimensions (half-inch compact tension) is reported. The small sample size requirement makes it attractive to do fracture toughness testing on newly synthesized material for preliminary material study and comparison purposes. Commercially available epoxy resins were used to check the procedure at different temperatures (-150° to 250° C). An empirical crack length averaging method was used that appears to give constant K_{Ic} values independent of the a/W ratio values. The fracture surfaces were studied using scanning electron microscopy. (13 refs.)
- 77831 Infrared measurement of specimen temperature profiles during fatigue crack propagation tests.** M.T. Hahn, R.W. Hertzberg, J.A. Manson (Materials Res. Center, Cox Lab., Lehigh Univ., Bethlehem, PA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.5, p.604-6 (May 1983).
Hysteretic heating of the crack tip often occurs during tests of fatigue crack propagation. If hysteretic heating occurs to a significant extent at and ahead of the crack tip in a notched polymer specimen, fatigue crack propagation behavior may be altered in a complex way. It is, therefore, important to monitor the temperature at crack tips during testing. Methods of temperature measurement are reviewed, and a semiautomated apparatus incorporating an infrared microscope for measuring temperature profiles during fatigue tests is described. (12 refs.)
- 77832 Optical measurement of crack length for the fatigue crack propagation test.** S. Ueda, T. Kanamaru (Kawasaki Heavy Industries Ltd., Akashi, Japan). *Syst. & Control (Japan)*, vol.27, no.2, p.130-7 (1983). In Japanese.
In the fatigue crack propagation test, which is a fatigue test of materials, length of crack caused by cyclic loading should be measured with high accuracy. The authors have developed an equipment to measure the crack length by means of microcomputer and line sensor camera which can be mechanically operated in X, Y and Z axis. They describe a method to extract crack and to measure crack length. Images of scratches on the specimen are eliminated through the comparison of pictures before and after propagation of crack. Crack length is measured by subtracting x-coordinate of the starting point of crack from that of the ending point of crack. The picture processing time is reduced by defining the region of interest. (5 refs.)
- 77833 Evaluation of acoustic properties of 'thin' laminations and one-line nonmetallic inclusions in steel sheets.** K.E. Abbakumov, A.S. Golubev (V.I. Ulyanov Leningrad Inst. of Electrical Engng., Leningrad, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.685-7 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.22-4 (Sept. 1982).
A study was made of reflection and acoustic-transmittance coefficients for discontinuities calculated in accord with a suggested impedance model and checked experimentally, with a satisfactory agreement of the results. The model can be recommended for the solution of a number of practical problems that involve the actual inspection sensitivity for steel sheets. (4 refs.)
- 77834 Samples for determining the point of exit and the angle of entry of the ultrasonic beam in pipe inspection.** Ya.F. Grebenyuk. *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.688-9 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.25-6 (Sept. 1982).
To determine the angle of beam entry for transducers with a curved working surface, the authors propose using a sample in the shape of a semicylinder (or a quarter-cylinder), on which a scale is drawn. The radius of the semicircle must correspond to the radius R_p of the testpiece. The sample is made from a metal with acoustical properties similar to those of the testpiece. Since transducers with a definite angle of incidence of $30-40^\circ$ are used for the ultrasonic inspection of pipe, a combination sample can be made to determine the point of exit and the angle of entry of the beam. (4 refs.)
- 77835 Maximum attainable sensitivity of inspection by 'multiple shadows' method.** V.E. Artemov, S.K. Pavros (V.I. Ulyanov Leningrad Inst. of Electrical Engng., Leningrad, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.691-3 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.28-9 (Sept. 1982).
Ultrasonic defectoscopy of product samples with rough surfaces by the shadow method has an important disadvantage—its sensitivity is low. This can be explained by fluctuations of the transmitted signal due to instability of the acoustic contact and due to scattering of sound by surface asperities. The sensitivity can be improved by the 'multiple shadows' technique, in which presence of a defect is recorded by the N-th ($N > 1$) pulse passing through the sample. The probability density distribution of amplitudes of signals passing through a product sample with rough surfaces is derived. Relations are presented which yield expressions for the defectoscope triggering threshold for a given inspection reliability. Equating these expressions to one another yields an estimate of the maximum attainable sensitivity. (4 refs.)
- 77836 Use of oblique wide-beam probe for inspection of strips with normal waves.** V.A. Pilui. *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.694-5 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.30-1 (Sept. 1982).
For ultrasonic inspection of strips with normal waves, one uses oblique transducers which cover a large inspection zone during a single pass, up to 1.5-m wide with a 24×35 -mm large piezoelectric transducer. The sensitivity and the nonuniformity of such an inspection, depending on the distance of a defect as well as on other factors, is determined by the linear dimensions of the piezoelectric transducer. For a more reliable inspection, it is necessary that the piezoelectric transducer be elongated in the direction of its movement. Then the lengthening of the near zone in its longitudinal plane will reduce the nonuniformity of its sensitivity within the inspection zone, while widening the beam of ultrasonic waves will increase the inspection reliability. Experiments were performed on strips of aluminum alloys with ultrasonic waves incident at angles of 36 and 57° , respectively, and with a drilled through-hole 1 mm in diameter as control reflector. (2 refs.)
- 77837 Interpretation of the results of thermal inspection with changes in the emitting capacity of the surface of objects of inspection.** N.A. Bekeshko (Sci.-Res. Inst. of Introscopy, Moscow, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.696-8 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.32-4 (Sept. 1982).
A method and the equipment making it possible to take into consideration a change in the emitting capacity of objects of inspection and to eliminate errors in revealing defects related to this are described. (3 refs.)
- 77838 A universal heat source for active thermal inspection.** N.A. Bekeshko, I.D. Voronin, P.V. Sokolov. *Sov. J. Nondestr. Test. (USA)*, vol.18, no.9, p.698-9 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.34-6 (Sept. 1982).
Describes the type IN-1 universal heat source, which is designed for heating a broad range of parts and materials (both metallic and nonmetallic) from room temperature to 300° C with a controllable heating time in active thermal inspection. The basis of its operation is the principle of heating a portion of the surface of the object of inspection with a directed flow of radiant energy created by a series of infrared lamps located in parallel in a special reflector. The amount of radiant energy flow depends upon the distance between the heater and the heated surface. The source of radiation is a system consisting of two groups of type KG220-1000 infrared quartz-halogen lamps (power of each lamp 1000 W). The direct flow of radiation and also that reflected from the surface of the reflector, occurring with supply of a voltage to the lamps, are directed to the object and, absorbed by the surface, heat it. (1 ref.)

77839 Distribution of magnetic induction in ferromagnetic product samples magnetized by pole method. A.S.Shleenkov (Inst. of Metal Phys., Acad. of Sci., USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.713-17 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.52-6 (Sept. 1982). An approximate method is proposed for calculating the magnetic induction inside ferromagnetic product samples having dimensions comparable with those of the electromagnet and having a nonuniform magnetic flux distribution. Results of experimental verification are also presented. (2 refs.)

77840 A method of reducing the effect of the gap in eddy-current measurements of conductivity. D.I.Kosovskii, A.I.Nikitin, Yu.M.Shkarlet (All-Union Sci. Res. Tech. Inst., Dnepropetrovsk, USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.717-22 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.56-62 (Sept. 1982). A method of reducing the effect of a change in the distance between the superimposed transducer and the plane article under test on the reading of eddy-current amplitude-phase and phase instruments for measuring the electrical conductivity of the material of the article is described. The basic idea of the method is undercompensation by a certain amount of the open-circuit voltage (impedance) of the superimposed transducers and the use of the change in the sign of the curvature of the hodograph characterizing the dependence of the voltage introduced by the superimposed transformer transducer on the increase in the distance between them and the plane article being monitored. (8 refs.)

77841 IMPOK-1 pulse magnetic flow-line controller. M.A.Mel'gui, V.F.Matyuk (Inst. of Appl. Phys., Acad. of Sci., Belorussian SSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.722-5 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.62-6 (Sept. 1982). A description is given of the flow chart and technical data of the IMPOK-1 installation for checking the mechanical properties of mild steels in flow-production systems. (5 refs.)

77842 Interrelation of the magnetic and mechanical properties with the structural state of hardened and tempered products. M.N.Mikheev, E.S.Gorkunov, V.M.Somova, A.B.Kut'kin (Inst. of Metal Phys., Acad. of Sci., USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.725-32 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.66-75 (Sept. 1982). Studies the effect of hardening and various tempering regimes on the physical properties of the structural steels SP-28, 30KhGSA, and 40Kh. It discusses the possibility of using the investigated magnetic characteristics as parameters of the nondestructive inspection of the mechanical properties of products made of the mentioned steels after hardening and tempering. (14 refs.)

77843 Approximate calculation of three-dimensional models in the theory of eddy current inspection with attached transducers. Yu.K.Fedosenko (Sci.-Res. Inst. of Introspect, Moscow, USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.732-9 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.75-83 (Sept. 1982). The theory of eddy current inspection is examined with special reference to the conditions in which the defect field depends on all three coordinates. Approximate equations are derived for the introduced voltage for rectangular and square transducers taking into account the dimensions of their windings. Signals from defects are measured and compared with the calculated values. The results do not differ by more than 30-35%. (5 refs.)

77844 Determination of the thickness of the information-carrying layer in the examination of the structure by the Barkhausen noise method. V.I.Vengrinovich (Inst. of Appl. Phys., Acad. of Sci., Belorussian SSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.739-42 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.83-7 (Sept. 1982). The thickness of the information-carrying layer x_i in structure examination by the Barkhausen noise method refers to the depth of the thin layer, the signal from which attenuates e times. A calculation-experimental method of determining this thickness is substantiated. The method is based on the asymptotic expansion of the integral $\int_0^{\infty} V_0(\delta) e^{-z/\delta} dz$ in power x_i , where z is the coordinate of the layer; $V_0(\delta)$, normalized intensity of Barkhausen noise after removing a layer with thickness δ (determined by means of experiments). It is shown that the resonance Barkhausen noise method can be used to control the depth of the information-carrying-layer in the region from 40 to 300-400 μm . (7 refs.)

77845 A device with improved selective sensitivity for structure examination by the Barkhausen noise method. V.I.Vengrinovich, V.N.Bus'ko, V.I.Tsukerman (Inst. of Appl. Phys., Acad. of Sci., Belorussian SSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.742-4 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.87-9 (Sept. 1982). A new method of increasing the selective sensitivity of structure examination is used in a digital Barkhausen noise analyzer. The device can be set with respect to the controllable parameter and tuned away from the interfering factors. The analyzer can work in automatic or manual regime. It is shown that the analyzer can be used for reliable sorting of pipes on the basis of grades of steels. The analyzer can be used for the magnetic phase analysis of steels, for inspecting the carbon and nickel content of steels, and for the sorting of steel into grades. (7 refs.)

77846 Oscillators of short high-power electric pulses for the electromagnetic-acoustic excitation of ultrasound. M.S.Boiko, Yu.V.Petrov (Chelyabinsk Polytech. Inst., Chelyabinsk, USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.9, p.748-9 (Sept. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.9, p.92-3 (Sept. 1982). The introduction of the electromagnetic-acoustic (EMA) method of the excitation and registration of ultrasound into the practice of nondestructive testing is restricted by the low sensitivity in comparison with the piezoelectric method. The sensitivity of the method is expressed by the useful signal-noise ratio. One of the methods of increasing the sensitivity of the EMA method is to increase the output power of the oscillators of probing pulses of the EMA flaw detection device. Investigators at the Chelyabinsk Polytechnical Institute developed and constructed a magnetohyristor oscillator of probing pulses. (4 refs.)

77847 A simple method for the determination of the coating thickness of galvanized steel. R.M.Saleh, F.M.Abel Wahab, M.M.Badran, A.A.El Hosary (Lab. of Electrochem. & Corrosion, Nat. Res. Centre, Cairo, Egypt). *Surf. Technol. (Switzerland)*, vol.18, no.3, p.283-90 (March 1983). The dissolution of galvanized steel in acid solutions was followed by the thermometric, potential-time and weight loss techniques. Only the zinc coat is attached in HCl and H_2SO_4 , whereas in HNO_3 curves representing the stepwise dissolution of the coating layer and the steel base are obtained. Comparable values of the time t required for complete dissolution of the zinc coat were obtained by the three techniques. The dissolution in 2 N H_2SO_4 of steel pieces with various coating thicknesses was examined by the thermometric method. Starting from the initial temperature T_i , the temperature of the system rose to attain a maximum value T_m after a time t and then decreased.

For a coating thickness of up to 6 g dm^{-2} , both $\Delta T = T_m - T_i$ and t varied linearly with coating thickness. The results suggest that the thermometric method is suitable for the determination of the coating thickness of galvanized steel. (11 refs.)

77848 Quality control through non-destructive testing. E.Burgisser.

Schweiz. Tech. Z. (Switzerland), vol.80, no.10, p.6-9 (18 May 1983). In German.

To secure good quality of final steel products the semi-finished steel must be thoroughly inspected and the present, well established, method of inspection of surface integrity consists of spreading a fine magnetic powder and generating a magnetic field through the tested material. This method shows the 'skin effect'. A drawing shows the scatter of flux caused by a surface crack. A sketch of the test facility is given and the test procedure is described in detail. By altering the grain size of the magnetic powder and the strength of the magnetic field it is possible to discriminate serious defects from small ones that can be tolerated. (no refs.) G.R.S.

77849 Know your welding NDT-radiographic testing. C.R.Weymueller.

Weld. Des. & Fabr. (USA), vol.56, no.3, p.49-59 (March 1983). Reviews radiographic testing, by X-ray and gamma ray, which locates and depicts defects in welds and weldments, thin to thick. (no refs.)

77850 Magnetic flux leakage inspection of wire rope. M.J.Bergander.

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.113-23. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The most important types of damage in steel wire ropes are listed. The technique and apparatus for magnetic flux leakage inspection are briefly outlined. The applications of the testing procedures and ways of interpreting the test results are discussed. (18 refs.)

77851 An inverse problem formulation of electromagnetic rope testing.

R.Sezenc (Lab. Central des Ponts et Chaussées, Bouguenais, France). In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.125-58. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

An analysis is presented for the frequency response of an encircling solenoid to the internal structure of a sample. A numerical procedure allows the extraction of the spatial variations of the core electrical conductivity and magnetic permeability from the frequency response of the sensor. The method is illustrated both with numerical examples and model experiments. (16 refs.)

77852 The Seebeck effect as used for the nondestructive evaluation of metals. C.M.Stuart (Technicorp., Wayne, NJ, USA).

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.177-91. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The principle of the Seebeck effect in measuring the EMF (electromotive force) created at the heated junction of dissimilar metals is being employed as a technique for nondestructively sorting metals and alloys. (2 refs.)

77853 An electrostatic charge decay technique for nondestructive evaluation of nonmetallic materials. Ming-Kai Tse, N.P.Suh (Lab. for Mfg. & Productivity, MIT, Cambridge, MA, USA).

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.193-226. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

A novel nondestructive evaluation technique based on electrostatic charge decay (ECD) in nonmetallic materials is introduced. The basic concepts and the feasibility studies are reviewed. Recent experimental results on thin non-metallic coatings are presented. Finally, the key practical considerations in applying this technique are also examined. (11 refs.)

77854 Digital nondestructive evaluation of composite materials [ultrasonic inspection]. R.A.Blake (Center for Composite Materials, Univ. of Delaware, Newark, DE, USA).

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.227-48. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The versatility and computational abilities associated with digital systems are applied to the ultrasonic evaluation of composite materials. A digital approach offers flexibility regarding the form of the output from ultrasonic inspections and facilitates data interpretation. The introduction of A/D converters operating above 20 MHz has allowed for the development of a digital analyzer which can adapt to the requirements of nondestructively evaluating the complex structures of composites. Computer graphics and digital imaging are incorporated to produce a totally digital system which demonstrates superior performance and provides the quantitative base necessary for the implementation of more sophisticated signal and image processing techniques. (7 refs.)

77855 Multi-dimensional eddy current coils. R.A.Nance, A.J.Caffarel, W.H.Hartley (Westinghouse Bettis Atomic Power Lab., Mifflin, PA, USA).

In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.249-56. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

One of the major problems associated with the eddy current inspection of tubing by either an internal bobbin coil probe or an external encircling coil is the inability of such sensors to reliably detect transverse oriented cracks. A dual winding eddy current test coil system is described which can be used either as an internal probe or as an external encircling coil to inspect tubing for transverse cracking as well as cracks in other orientations. Further, this coil system provides approximately equal peak-to-peak response for a specific size crack no matter what its orientation (from transverse to axial). (no refs.)

77856 Evaluation of microencapsulated penetrant inspection. J.M.Portaz

(Aircraft Engine Group, General Electric Co., Cincinnati, OH, USA). In book: *International advances in nondestructive testing. Vol.9*, W.J.McGonagle [Ed.], p.283-363. New York, USA: Gordon & Breach (1983), 363 pp. [0 677 16440 8]

The results are presented of a program to evaluate the merits and shortcomings of microencapsulated penetrants for use in fluorescent penetrant inspection to evaluate capsule and spray parameters to effectively use microencapsulated penetrants, and to compare the sensitivity of such a system to a conventional MIL-I-25135 Group VI liquid fluorescent penetrant inspection system. The program was divided into four phases which encompassed selection of materials for encapsulation, evaluation of capsule and spray variables, investigation of removal and developer techniques, measurement of sensitivity, and a process demonstration including environmental and economic analysis. The work culminated with the successful demonstration that microencapsulated penetrants could be applied in such a way to achieve equivalent sensitivity with a MIL-I-25135 Group VI liquid penetrant system. The microencapsulated penetrant system as now developed uses only nonaqueous wet developers which are more costly than dry or aqueous wet developers. (no refs.)

77857 Potentiostatic etching of carburized steels. P.Helbach, E.Bullock. Report EUR 8138 EN, Comm. European Communities, Luxembourg (1982), 29 pp.

Traditional etching techniques have proved inadequate for the accurate estimation of carbides in carburized steels by optical imaging. The requirement for etch uniformity precludes the use of alkaline etchants and the necessity for sharp edges prohibits acid etching of the surrounding austenite. In response to this shortfall, a new technique has been developed for the controlled deposition of layers, by potentiostatic anodisation of polished alloy surfaces. This process provides much greater contrast between carbide and matrix than that obtainable from vapour-deposited or reaction-sputtered interference films, while retaining the very accurate edge definition and the phase identification capability of these techniques. In order to demonstrate the advantages of the new process, the investigation includes a comparison with several currently available carbide contrasting techniques as applied to a series of typically carburised steels. (2 refs.)

77858 Evaluation of electrode shape and nondestructive evaluation method for welded solar cell interconnects. C.R.Baraona, S.J.Klima, T.J.Moore, W.E.Frey, A.F.Forestieri (Lewis Res. Center, NASA, Cleveland, OH, USA). Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.90-5

Resistance welds of solar cell interconnect tabs were evaluated. Both copper-silver and silver-silver welds were made with various heat inputs and weld durations. Parallel gap and annular gap weld electrode designs were used. The welds were analyzed by light microscope, electron microprobe and scanning laser acoustic microscope. These analyses showed the size and shape of the weld, the relationship between the acoustic micrographs, the visible electrode footprint, and the effect of electrode misalignment. The effect of weld heat input on weld microstructure was also shown. (6 refs.)

77859 Nondestructive testing of interconnect welds using the Scanning Laser Acoustic Microscope (SLAM). C.L.Vorres, D.E.Yuhas, J.Semmens, M.G.Oravecz (Sonoscan Inc., Bensenville, IL, USA). Conference Record of the Sixteenth IEEE Photovoltaic Specialists Conference - 1982, San Diego, CA, USA, 27-30 Sept. 1982 (New York, USA: IEEE 1982), p.102-7

Three recent studies involving the evaluation of resistance welds between interconnects and silicon solar cells using the SLAM are described. Using this technique, nondestructive testing of the bond between the tap and cell can be made rapidly and with high resolution. Different configurations and compositions of interconnectors as well as cells with and without coverglasses were tested. Degradation in the bonding of the coverglass was also observed. Metallographic sections were made following the third study. Excellent correlation was found between SLAM results and areas found bonded after sectioning. (2 refs.)
